SELECTED WATER RESOURCES ABSTRACTS

VOLUME 7, NUMBER 21
NOVEMBER 1, 1974

THE LIBRARY OF THE
JAN 03 1975
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

W74-10901 -- W74-11450

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription rates are: To the SWRA Journal, $75 ($95 foreign); to the Journal & Annual Index, $100 ($125 foreign); to the Annual Index only, $50 ($65 foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 7, NUMBER 21
NOVEMBER 1, 1974

W74-10901 -- W74-11450

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

2. WATER CYCLE

2A. General

THE DETERMINATION OF ZONES OF INTENSE CONTRIBUTION TO STREAM FLOW AS RELATED TO THE CONCEPT OF PARTIAL AREA CONTRIBUTIONS,
Maryland Univ., College Park. Dept. of Civil Engineering.
V. C. Bissell, and R. M. Ragan.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-234 623, $5.50 in paper copy, $2.25 in microfiche. Maryland Water Resources Research Center, College Park, Technical Report No 21 (1974). 188 p, 46 fig, 35 tab, 16 ref, 5 append. OWRR B-005-MD(1). 14-01-0001-1909.

Descriptors: *Storm runoff, *Distribution patterns, Areal, Forest watersheds, New England, Rainfall intensity, *Precipitation intensity, *Rainfall disposition, *Channel flow, Surface runoff, *Rainfall-runoff relationships.

An extensive field investigation was conducted at the University of Vermont in summer of 1966 to examine the physical processes contributing to areal and temporal distribution patterns of storm runoff from forested New England watersheds. The present study was directed at an extension of the limited conclusions of the earlier investigators by consolidation of several phases of independently collected data. The relative importance of such factors as precipitation intensity, duration, and volume in producing stormflow from isolated subareas was inspected. The source-wise distribution of laterial inflows to a selected stream channel reach was also monitored. Relative runoff contributions were evaluated during both storm and non-storm periods. The percent of rainfall returned to the channel as stormflow was found to be an order of magnitude greater from particular low-lying wet areas than from the entire area draining into the channel reach. It was found that these wet areas contributed a greater percentage of the lateral inflow to the reach during non-storm periods than during storm periods. The percent of rainfall returned as stormflow from the selected subareas during a storm showed a moderate dependence upon rainfall volume, while displaying little dependence upon storm intensity. The existence of active source areas for storm runoff was shown by the fact that over one-half the lateral inflow to the channel reach was contributed by subareas making up only 4.3% of the total area draining into the reach.

A FINITE ELEMENT APPROACH TO WATERSHED RUNOFF,
University Coll. of Swansea (Wales). Dept. of Civil Engineering.
C. Taylor, G. Al-Mashidani, and J. M. Davis.
Journal of Hydrology, Vol 21, No 3, p 231-246, 1974.

Descriptors: Model studies, *Simulation analysis, *Mathematical models, *Watershed management, *Runoff, *Algorithms, *Finite element analysis.

Watershed direct runoff problems are analyzed by a numerical finite element-based implicit recurrence relationship. The algorithm is shown in a two-dimensional form for the full momentum and continuity equations. It is presented unidimensionally for the kinematic wave theory. Because the whole domain is represented and solved as a single set of matrix equations, the advent of shocks for domains where appreciable changes in slope and/or resistance to flow occur is immediately recognizable. (Murphy-FIRL)

PIERRE PERRAULT: THE MAN AND HIS CONTRIBUTION TO MODERN HYDROLOGY,
Geological Survey, Raleigh, N.C.
R. L. Nace.
Water Resources Bulletin, Vol 10, No 4, p 633-647, August 1974. 16 ref.

Descriptors: *Hydrology, *History, *Hydrogeology, *Springs, Hydrologic cycle, Groundwater movement.

Pierre Perrault (1611-1680), was an amateur scientist and early hydrologist, a member of a bourgeois provincial family whose roots were in the Touraine region of France. One of six brothers, all characterized by brilliance and diversity, he was educated as a lawyer but turned to finance and rose to a high position under King Louis XIV. Owing to political naivete and financial imprudence, he fell into disgrace and went bankrupt. As an amateur scientist he wrote a book on the origin of springs. This book broke almost wholly with the traditional authoritarianism of 2,000 years' standing, and set hydrology on the modern path of observation and direct experiment. He developed the concept of the hydrological cycle, correctly accounting for the disposition of rainfall by evaporation, transpiration, groundwater recharge and runoff. Some of his ideas about specific processes were erroneous, but where he was wrong his errors were logically based. Much of his contribution to the foundation of scientific hydrology has been overlooked or distorted by historians and hydrologists. (Knapp-USGS)
W74-11206

USERS GUIDE FOR A U.S. GEOLOGICAL SURVEY RAINFALL-RUNOFF MODEL,
Geological Survey, Reston, Va.
C. W. Boning.
Open-file report 74-33, May 1974. 232 p, 2 fig, 2 tab, 2 ref.

Descriptors: *Mathematical models, *Computer programs, *Rainfall-runoff relationships, Streamflow forecasting, Runoff forecasting, Routing, Infiltration, Soil moisture, Synthetic hydrology, Simulation analysis.

The U.S. Geological Survey developed a rainfall-runoff model to synthesize flood discharges for small drainage areas. This report provides guidelines for the assembly, storage, and retrieval of data needed to use the model, and also provides descriptions and documentations of computer programs for model calibration and flood record synthesis. The model employs digital computer solutions of mathematical relations to approximate the hydrologic processes of infiltration, soil moisutre storage, and surface runoff routing. Constants and limits in the mathematical relations are determined automatically by an internal optimization procedure to calibrate the model to a specific drainage site. Recent modifications include the optimization of parameters in the surface runoff routing computations, and provisions for synthesizing flood runoff from small urban watersheds. (Knapp-USGS)

W74-10904

A SCHEME FOR ASSESSING THE RELIABILITY OF INTERPOLATED RAINFALL ESTIMATES,
Birmingham Univ. (England). Dept. of Civil Engineering.
P. S. Kelway.
Journal of Hydrology, Vol 21, No 3, p 247-267, 1974. 5 fig, 9 tab, 8 ref.

Descriptors: Model studies, *Computer models, *Stimulation analysis, *Rainfall, Hydrologic cycle, Rain gages, Distribution patterns, *Forecasting, *Estimating, *Reliability.

Quantification of the significance of variables controlling the reliability of interpolated estimates of rainfall is attempted. Alternative ways of expressing the gauge network and rainfall distribution patterns in a form that may be used in estimating equations for assessing error in interpolated values are examined. A scheme is devised for obtaining equations analytically for any interpolation method used to derive information; the results of a study relevant to a specific analysis technique are shown. The purpose of the scheme is to enable confidence limits to be placed on interpolated output during computer processing of rainfall data. Comparisons may then be made between available analytical techniques, results being assessed under operational conditions. Once a user has selected a suitable method of analysis, the factors likely to control the accuracy of the information produced are monitored during processing and likely tolerance limits are given for output values. CAUSES FOR PRECIPITATION INCREASES IN THE HILLS OF SOUTHERN ILLINOIS,
Illinois State Water Survey, Urbana.
D. M. A. Jones, F. A. Huff, and S. A. Changnon, Jr.
Report of Investigation 75, 1974. 36 p, 33 fig, 16 tab, 20 ref. NSF Grant GA-19494.

Descriptors: *Precipitation(Atmospheric), *Illinois, *Climatology, *Meteorology, Evapotranspiration, Nucleation, Clouds, Diurnal distribution, Winds, Topography, Seasonal, Rainfall, Weather patterns.
Identifiers: *Shawnee Hills(IL), Hill effect, Diurnal differences, Radar echoes.

Three major studies show that the hill enhancement of precipitation is the addition of moisture due to greater evapotranspiration from the forested hills and the convergent wind field created over the western hills caused by the configuration of the hills and valleys. Three methods differing in scale and time were used to delineate the hill anomaly and to determine the reasons for it. First, a series of climatic studies of precipitation distribution considering daily, monthly, and seasonal data for comparison of hill and flatland stations were performed during 1960-1963. Second, a 5-year project involving analysis of data from a special raingage network on the basis of in-

dividual rain periods, months, and seasons during 1965-1969 was planned to define the areal extent of the hill high. Third, the results of these two studies were used to design a 1-month field study involving a weather radar, 3 cloud cameras, 5 weather (temperature-humidity) stations, 1 pilot balloon site, and aircraft sampling flights. ROLE OF THE ENVIRONMENT IN THE FORMATION OF DENSITY DYNAMICS OF THE MUSKRAT OF YAKUTSK, (IN RUSSIAN),
Akademiya Nauk SSSR, Yakutsk. Institut Biologii.
Yu. V. Labutin, and M. V. Popov.
Ekologiya. Vol 4, No 3, p 70-76, 1973. Illus.

Descriptors: *Animal populations.
Identifiers: Muskrat, Ondatra zibethica, Trapping, Yakutsk(USSR).

The most important environmental factors determining the density dynamics of the muskrat (Ondatra zibethica) in Yakutia, USSR are the weather conditions, hydrologic regime of the waters and trapping. The most significant of the abiotic factors is freezing of the waters, since the subglacial mode of life of the muskrat in Yakutia lasts about 8 mo. (Oct-May). Rigorous winters with little snow lead to freezing of the shallow feeding areas of the waters and cause a drop in the numbers of the muskrat. High floods and droughts have the same effect. Trapping in 1963-64 amounted to about 200,000 pelts.--Copyright 1974, Biological Abstracts, Inc.

CATALOG OF USSR GLACIERS. VOLUME 16. ANGARA-YENISEY REGION. NO. 1. YENISEY. PARTS 3-5. NO. 2. ANGARA. PART 1. (KATALOG LEDNIKOV SSSR. TOM 16. ANGARO-YENISEYSKIY RAYON. VYPUSK 1. YENISEY. CHASTI 3-5. VYPUSK 2. ANGARA. CHAST' 1),
Akademiya Nauk SSSR, Moscow. Institut Geografii.
V. I. Sil'nitskaya, and L. P. Chernova.
Gidrometeoizdat, Leningrad, 1973. 64 p.

Descriptors: *Glaciers, *Data collections, Glaciation, Climatology, Geomorphology, Firn, Runoff, Ablation, Glacial drift, River basins, Stations, Investigations, Publications, Maps.
Identifiers: *USSR, *Angara River(USSR), *Yenisey River(USSR).

Geographic location, morphology, climatic conditions, and regime of glaciers were investigated in the Angara-Yenisey Region in East Siberia. Areas covered are the Kazyr and Kan River basins, Kemchik River basin, the basin in upper reaches of the Yenisey River upstream from the mouth of the Kemchik River, and basins in upper reaches of the Oka and Uda Rivers. Attention is focused on glacier-surface characteristics which influence river regime and amount and distribution of runoff through time. Basic glacier data, onsite and station glacier investigations, and lists of pertinent glacier publications and of hydrometeorological stations in the vicinity of glaciers are tabulated. All parts of the 'Catalog of USSR Glaciers' were compiled at the Department of Glaciology of the USSR Academy of Science's Institute of Geography. (Josefson-USGS)

NORTH CASCADES HIGHWAY SR-20 AVALANCHE ATLAS,
Washington Univ., Seattle. Dept. of Civil Engineering.
E. R. La Chapelle, and R. Leonard.
Available from NTIS, Springfield, Va 22161 as PB-220 336, Price $3.00 printed copy; $2.25 microfiche. Report for Washington State Highway Commission, June 1971. 175 p.

Descriptors: *Avalanches, *Highways, Roads, *Washington, Hazards, *Maps, Mapping, *Data collections.
Identifiers: *North Cascades Highway(Wash).

This Avalanche Atlas catalogs details of snow avalanche activity along the North Cascades Highway, Washington, SR-20, between Newhalem on the west side of the Cascade Mountains and Mazama on the east side. The Atlas, prepared in loose-leaf form, is designed primarily as an operational guide for Highway Department maintenance personnel who will be involved in snow removal operations on SR-20. Each avalanche path is outlined on annotated maps and photographs. Normally, this outline indicates the maximum recognizable extent of past avalanche activity on each path. The hazard rating given on each Summary Sheet is a subjective estimate of the encounter probability between a falling avalanche and moving highway traffic. (Knapp-USGS)

EVALUATION OF GLACIER MASS BALANCE BY OBSERVING VARIATIONS IN TRANSIENT SNOWLINE POSITIONS,
Norwegian Water Resources and Electricity Board, Oslo.
G. Ostrem.
Available from NTIS, Springfield, Va., 22161 as N74-13055, Price $3.00 printed copy; $2.25 microfiche. Report 376 for The Royal Norwegian Council for Scientific and Industrial Research (NTNF), October 1973. 8 p, 3 fig, 1 tab, 3 ref.

Descriptors: *Glaciers, *Water balance, *Remote sensing, Snowpacks, Satellites(Artificial), Snow surveys, Snow cover, Mountains, Glaciohydrology.
Identifiers: *Snowline, *Norway.

The position of the transient snowline on glaciers in South Norway was studied by remote sensing to evaluate glacier mass balance at glaciers where no direct observations are made. The height of the transient snowline on glaciers is closely tied to the mass balance; it will reach higher altitudes in years of negative mass balance, when rivers gain extra amounts of melt water from glacier retreat. The correlation between snowline heights and glacier mass balance is known for eight glaciers in South Norway; repeated satellite imagery can be used both to extrapolate similar information to a large number of glaciers and to estimate the mass balance for a great number of glaciers at the end of any melt season. (Knapp-USGS)

AVALANCHES ON THE NORTH CASCADES HIGHWAY (SR-20)--SUMMARY REPORT,
Washington Univ., Seattle. Dept. of Civil Engineering.
E. R. La Chapelle, and C. B. Brown.
Available from NTIS, Springfield, Va. 22161 as PB-220 337, Price $3.00 printed copy; $2.25 microfiche. Washington University Geophysics Program and Department of Civil Engineering Report for Washington State Highway Commission, September 1971. 65 p, 7 fig, 2 tab.

Descriptors: *Avalanches, *Highways, *Washington, *Roads, Hazards, Data collections, Safety.
Identifiers: *North Cascades Highway(WA).

Snow and avalanche climate varies widely across the parts of the Cascade Mountains of Washington. Little information is presently available about temperatures and weather patterns over the passes, but a limited amount of snow depth data are available from snow courses. These snow data are presented and analyzed. Several distinct zones of avalanche activity extend form Newhalem on the west to Early Winters Creek on the east. These zones each have distinct types of avalanche occurrence and patterns of hazard for the highway. Periods of high hazard for different zones do not coincide in time. Due to the wilderness nature of the highway and lack of public facilities, the whole highway probably has to be closed each time hazard develops in any one zone. The most serious danger from avalanches exists in the Liberty Bell and Cutthroat Ridge zones between Washington

Pass and Cutthroat Creek. The recommended method of dealing with avalanche hazards on SR-20 is management of traffic flow, closures, and artificial avalanche release. The percentage of time the highway can be kept open in the winter depends on a trade-off with costs and desired level of public safety. In general, a decrease in closure time can be obtained only at the price of increasingly complex and costly avalanche control. Reducing closure time lower than 15%-20% does not presently appear feasible. This level of operation will be possible only after several years of experience. (Knapp-USGS)

INVESTIGATION AND CALCULATION OF ICE JAMS (ISSLEDOVANIYE I RASCHETY ZATOROV I ZAZHOROV L'DA).
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 219, Chizhov, A. N., editor, Leningrad, 1974. 87 p.

Descriptors: *Ice, *Ice cover, *Ice jams, *Rivers, Ice breakup, Ice loads, Melting, Water levels, Hydroelectric plants, Tailwater, Model studies, Meteorology, Aerial photography, Equations.
Identifiers: *USSR(Dniester River).

Problems of ice jams on rivers were investigated in this collection of 6 papers prepared by the State Hydrologic Institute in Leningrad. Titles of individual papers are: (1) formation of ice jams on the Dniester River; (2) investigation of stability of ice cover on the Dniester in spring; (3) model studies of ice-jam formation for justification of a method of ice retention on the Dniester and for determination of ice loads; (4) ice-jam formation patterns in tailwater channels of hydroelectric powerplants; (5) model studies of ice movement under ice cover; and (6) use of aerial surveys for investigation of ice jams. GLACIOHYDROCLIMATOLOGY OF MOUNTAINOUS COUNTRIES (GLYATSIOGIDROKLIMATOLOGIYA GORNYKH STRAN).
Mezhduvedomstvennyy Geofizicheskiy Komitet pri Presidiume Akademii Nauk SSSR, Glyatsiologicheskiye Issledovaniya, No 24, Izdatel'stvo 'Nauka', Moscow, Kotlyakov, V.M., editor, 1973. 200 p.

Descriptors: *Glaciology, *Glaciohydrology, *Climatology, *Mountains, Regions, Basins, Glaciers, Glaciation, Alpine, Hydrologic cycle, Runoff, Ablation, Melting, Snowmelt, Snowpacks, Snow surveys, Meteorology, Precipitation(Atmospheric), Temperature, Winds.
Identifiers: *USSR, Caucasus, Soviet Central Asia, Altay Territory, Glacier mass budget.

This collection contains 26 papers prepared on the basis of reports presented at the Fourth All-Union Symposium on Glaciology held at Terskol in 1968. Investigations on glaciohydrology and climatology of mountainous countries are currently extensively conducted in the USSR in mountains of the Caucasus, Soviet Central Asia, and Altay after the framework of the International Hydrological Decade. Published results are of theoretical importance for calculating water balance of mountain-glacier basins and of practical importance with regard to water-resources use in mountainous regions. (Josefson-USGS)

2D. Evaporation and Transpiration

PHYSIOLOGICAL CHARACTERISTICS OF TREES AND SHRUBS CULTIVATED IN THE SOUTHERN STEPPES OF THE UKRAINE, (IN RUSSIAN),
B. F. Morozov.
Tr Kishinev S-Kh Inst. 93. p 86-93. 1972.

Descriptors: *Transpiration, Plant physiology.
Identifiers: Almond, Apricot, Cherry, Forestation, Honey locust, Mahaleb cherry, Russian olive.

Under the arid conditions of the southern steppes of the Ukraine (USSR) mesophytes having comparatively better water exchange and enduring profound changes in protein metabolism are the most suitable shrubs and trees for field protection afforestation. Such plants include honey locust, Russian olive, apricot, Mahaleb cherry, and almond. Tables of the moisture content of the soil in Aug. at the boundary of the II A and III A agroclimatic regions (in the vicinity of Gvardeiskoe, Crimea), of moisture content of the leaves and transpiration rate of 10 tree species, sugar content in the leaves of 14 ssp., and of content of protein N in leaves are presented.--Copyright 1974, Biological Abstracts, Inc.

EVAPORATION OF WATER FROM SAND, 3: THE LOSS OF WATER INTO THE ATMOSPHERE FROM A SANDY RIVER BED UNDER ARID CLIMATIC CONDITIONS,
National Inst. for Water Research, Windhoek (South West Africa).
D. H. R. Hellwig.
Journal of Hydrology, Vol 18, No 3/4, p 305-316, March, 1973. 2 fig, 5 tab, 17 ref.

Descriptors: *Evaporation, *Evapotranspiration, Consumptive use, *Water loss, Phreatophytes, *Arid climates, *Sands.

The Penman formula was applied to calculate evaporation and evapotranspiration losses under arid climatic conditions from a sandy river bed. Good agreement with measured results was obtained. The loss of water into the atmosphere from a river bed covering 8300 ha was estimated to be 76 million cu m/y. Evapotranspiration contributed 68% and permanently wet areas 19.5% to the total water loss. The rest evaporated from temporary wet areas. Substantial volumes of water can possibly be gained by the removal of phreatophytes. (See W73-07055, W73-07056 and W74-11267) (Skogerboe-Colorado State)
W74-11266

EVAPORATION OF WATER FROM SAND, 4: THE INFLUENCE OF THE DEPTH OF THE WATER-TABLE AND THE PARTICLE SIZE DISTRIBUTION OF THE SAND,
National Inst. of Water Research, Windhoek (South West Africa).
D. H. R. Hellwig.
Journal of Hydrology, Vol 18, No 3/4, p 317-327, March, 1973. 6 fig, 5 tab, 11 ref.

Descriptors: *Evaporation, *Consumptive use, Water loss, Acid climates, *Water table, Depth, Groundwater, *Particle size, *Sands.

Experiments were carried out to determine the influence of the depth of the water-table and the particle size of sand on evaporation of water from sand. Dropping the water table in sand, with a mean diameter of 0.53 mm, below 60 cm will practically prevent evaporation losses. The coarseness of the sand does not affect evaporation if the water table is kept at the sand surface. If the water table is kept below the sand surface, evaporation decreases with the coarseness of the sand and with the depth of the water table. Evaporation from an open water surface was 8% higher than from water-saturated sand, most probably due to higher energy storage in a body of water resulting in a greater temperature gradient between the evaporation surface of the water and the air during the night, as compared to a water-saturated sand. (See W74-11266) (Skogerboe-Colorado State)

A WEIGHING SYSTEM FOR LYSIMETERS,
Department of Agriculture, Ottawa (Ontario). Engineering Research Service.
P. W. Voisey, and E. W. Hobbs.
Canadian Agricultural Engineering, Vol 14, No 2, p 82-84, December, 1972. 3 fig, 25 ref.

Descriptors: *Lysimeters, *Weight, *Evapotranspiration, Soil moisture, Soilwater, Consumptive use, Soilwater-plant relationships.

A technique is described for weighing lysimeters using a strain gage load cell and an electronic indicating system. The nominal weight of the lysimeter is eliminated from the measurement by offsetting the indicator zero electrically using a weight. This increases the possible resolution and accuracy of measurement. In the example described, weight changes of plus or minus 22.7 kg in lysimeters weighing 180 kg with a resolution of 0.045 kg and accurate within 0.090 kg were measured. Weighing of 36 such lysimeters could be accomplished in two hours. (Skogerboe-Colorado State)

RATE OF EVAPORATION OF WATER FROM CAPILLARIES OF DIFFERENT DIAMETER INTO MOIST AIR (SKOROST' ISPARENIYA VODY IZ KAPILLYAROV RAZNYKH DIAMETROV VO VLAZHNYY VOZDUKH),
Akademiya Nauk SSSR, Moscow. Institut Fizicheskoi Khimii.
N. V. Churayev, and N. Ye. Yashchenko.
Pochvovedeniye, No 9, p 105-112, September 1973. 4 fig, 18 ref.

Descriptors: *Soil physics, *Evaporation, *Air-water interfaces, *Capillary action, *Films, Diffusion, Humidity, Vapor pressure, Isotherms, Surfaces, Quartz, Instrumentation, Measurement, Curves, Equations.
Identifiers: USSR.

Patterns of evaporation of water from capillaries into moist air and of evaporation into a vapor-unsaturated atmosphere are determined by the type of isotherms of disjoining water-film pressure on a quartz surface. Formation of a beta water film near the meniscus results in displacement of the evaporation area in a capillary by a value which increases as the capillary radius decreases. The flow of polymolecular alpha films along a capillary surface produces an increase in effective diffusion coefficients as compared to coefficients of molecular vapor diffusion through air. The effect of film flow can be observed experimentally at a humidity of 0.86 in capillaries with radii less than 10 microns and at a humidity of 0.96 in capillaries with radii less than 20 microns. The contribution of film transport is noticeable only at humidity values approaching unity and in fine capillaries. Possibilities of varying the rate of evaporation of water from capillaries by suppressing or intensifying film transport are examined. (Josefson-USGS)

NEW ANALYTICAL SOLUTIONS FOR DYE DIFFUSION EQUATIONS,
Princeton Univ., N.J. Water Resources Program.
R. W. Cleary, and D. D. Adrian.
Journal of the Environmental Engineering Division, American Society of Civil Engineers Vol 99, No EE3, Paper 9770, p 213-227, June 1973. 3 fig, 1 tab, 21 ref, append. OWRR A-041-MASS(2).

Descriptors: *Dye dispersion, *Dye releases, *Equations, *Diffusion, *Dispersion, Boundary processes, Open channel flow, Turbulent flow, Mixing, Mathematical models, Streamflow.

Partial differential equations describing the concentration distribution of a tracer dye released as an instantaneous source (line or point) subject to no-flux boundary conditions at the river bottom, surface, and banks were derived analytically using integral transform methods. The river is considered finite in the vertical and lateral directions, the dye source location is arbitrary, and the results represent two- and three-dimensional analytical solutions of tracer modeling and include the boundary effects of the river. The solutions have particular application in the calculation of turbulent diffusion coefficients in two and three dimensions. (Knapp-USGS)

RIVER MILE INDEX--VIRGIN RIVER BASIN, ARIZONA, NEVADA, UTAH.
Bureau of Reclamation, Boulder City, Nev., Region 3.
Pacific Southwest Inter-Agency Committee, Water Management Sub-Committee Report, March 1974. 21 p, 2 map.

Descriptors: *Rivers, *Nevada, *Utah, Arizona, Mapping, Tributaries, River basins, Geographical regions.
Identifiers: *River mile index, *Virgin River(Utah), *Muddy River(Utah).

This river mile index for the Virgin and Muddy Rivers in southern Nevada and Utah and the northwestern tip of Arizona is one of a series of reports to be issued for stream basins in the Pacific Southwest. River mileages were determined from measurements made on U.S. Geological Survey topographic quadrangles. The U.S. Geological Survey furnished information on stream gage locations, drainage areas, and water elevations at key points. River mile distances were measured upstream from the mouth to the nearest tenth mile. Tributaries are shown as entering from the right or left from a position facing downstream. (Knapp-USGS)

LARCH LITTER REMOVAL HAS NO SIGNIFICANT EFFECT ON RUNOFF,
Forest Service (USDA), La Crosse, Wis. Watershed Lab.
R. S. Sartz, and D. N. Tolsted.
USDA Forest Service/Research Note NC-163, 1974, 2 p, 1 tab, 3 ref.

Descriptors: *Runoff, *Litter, *Overland flow, *Forest watersheds, Leaves, Infiltration, Forest soils, Coniferous forests.
Identifiers: Larch trees.

Runoff was measured in an 11-year-old plantation of European larch (Larix decidua) on paired plots from which litter had either been or not been removed. On five of the six pairs, the plot on which litter had been left intact yielded more runoff, but the differences were neither statistically nor hydrologically significant. (Brown-IPC)

ROUGHNESS COEFFICIENTS OF VEGETATED FLOOD PLAINS,
Ministry of Transport and Waterways, the Hague (Netherlands). Maas-River Study Div.
G. J. Klaassen, and Zwaard J. J. Van Der.
Journal of Hydraulic Research, Vol 12, No 1, p 43-63, 1974. 20 fig, 7 ref.

Descriptors: *Roughness(Hydraulic), *Roughness coefficient, *Flood plains, Rivers, Flow resistance, Overland flow, River flow, Flow characteristics, Trees, *Chezy equation, Hydraulic models, Model studies.
Identifiers: *Vegetated flood plains, *Netherlands(River Mass), Hedges.

A model study was conducted on the hydraulic resistance of hedges and fruit trees which are common in the flood plain of the River Maas. The hedges, which grow to a height of 2 to 4 m, serve as partitions between plots of agricultural land. The fruit trees grow to a height of 2.5 to 3 m. A full-scale study using hedges from the flood plain of the Maas was made. The resistance of fruit trees was studied on a 1 to 10 scale. The Chezy coefficient of the flood plain was especially influenced by the spacing of the hedges, the number of trees per unit area in an orchard and by the water level over the flood plain. Removal of vegetation resulted in lower water levels and smaller mean current velocities in the summer bed and can, therefore, be useful as a means to compensate unfavorable effects caused by river-works in the flood plain. A graph is given showing the variation of Chezy coefficient with water depth and hedge spacing for flood plains. Another graph shows the variation of Chezy coefficient with water depth and number of fruit trees per unit area for flood plains. (Humphreys-ISWS)

INTRODUCTION TO THE FAUNISTIC STUDY OF DIPTERA IN A STREAM FROM THE PYRENEES NEAR THE ATLANTIC COAST: THE LISSURAGA, (IN FRENCH),
Station d'Hydrobiologie Continentale, Biarritz (France).
A. Neveu.
Ann Hydrobiol. Vol 3, No 2, p 173-196. 1972. Illus. English summary.

Descriptors: *Diptera, Aquatic insects.
Identifiers: Chironomidae, France, Lissuraga, Pyrenees, Salmonidae, Simuliidae.

A study carried on in a stream in the Pyrenees-Atlantiques (France) elucidated the part played by insects with aquatic larvae in the food of Salmonidae. Results for Diptera are presented. A first analysis showed the efficiency of capture methods on the various families, a preliminary condition to a more quantitative evaluation. The study of the faunistic composition showed the numerical size of 2 Diptera families: Chironomidae and Simuliidae, which make up 80-90% of the faunistic stock. The composition varies according to biotopes, in particular with regard to the location on the stream and to the substratum. Different stations have thus been studied over 5 km of stream, with regular samplings during 3 yr in various facies conditions. Density variations in stocks of Diptera larvae in time and space were shown. Populations were important in spring and autumn; in winter, sudden floods reduce them and in summer too warm waters slow down development, and result in a lack of micro-organisms. Fluctuations in stocks and their low enough mean level, due to excessively well-wooded banks, allow an explanation for the slow growth of Salmonidae in this stream to be formulated. It is thus possible to make a connection between the periods of fish growth and the presence of large populations of Diptera larvae.--Copyright 1974, Biological Abstracts, Inc.

FALL INCREASE OF THE POPULATION OF AQUATIC MITES IN THE MOUTHS OF RIVERS AND STREAMS, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Biologii Vnutrennykh Vod.
P. V. Tuzovskii.
Biol Vnutr Vod Inform Byull. 15. p 48-49. 1972.

Descriptors: *Mites, Aquatic insects.
Identifiers: Forella variegator, Mideopsis orbicularis, Insect populations.

Aquatic mites were counted every 10 days in the mouth of the Krasnoe stream near Borok (Rybinsk reservoir) (USSR) by means of a Mordukhai-Boltovskii tubular bottomgrab. Fourteen species were recorded. Beginning with the third wk. of Sept. there was a marked increase of the population of mites from 825 to 39,400 specimens/m2 with a subsequent equally marked drop beginning in the third wk. of Oct. Forella variegator and Mideopsis orbicularis dominated (respectively 47.1 and 17.8% of the total number of mites). Such a high population was probably due to the concentration of mites on the muddy bottom of the stream as the level of the reservoir was drawn down. Then the mites withdrew from the receding water and migrated deep into the body of water. Vast quantities of predaceous mites can have a substantial role in regulating the population of certain groups of invertebrates.--Copyright 1974, Biological Abstracts, Inc.

AUTOCORRELATION STRUCTURE OF MONTHLY STREAMFLOWS,
Geological Survey, Reston, Va. Water Resources Div.

M. E. Moss, and M. C. Bryson.
Water Resources Research, Vol 10, No 4, p 737-744, August 1974. 10 fig, 1 tab, 15 ref.

Descriptors: *Correlation analysis, *Streamflow, *Mathematical models, *Time series analysis, Base flow, Variability, Stochastic processes, Simulation analysis, Statistical models.
Identifiers: *Autocorrelation.

The autocorrelation structure of monthly streamflows, a nonstationary process, was developed from a mathematical model that assumes that monthly precipitation is an independent series and that the base flow of the stream is derived from a linear aquifer. Under these assumptions the first-order autocorrelation coefficients of streamflow vary seasonally, as do other statistics such as monthly means and standard deviations. Comparison of the autocorrelation coefficients predicted by the model with those computed from an actual streamflow record of 58 years indicates that the seasonality of streamflow is well represented by the model. (Knapp-USGS)
W74-11419

GENERALIZED SKEW COEFFICIENTS OF ANNUAL FLOODS IN THE UNITED STATES AND THEIR APPLICATION,
Geological Survey, Reston, Va.
C. H. Hardison.
Water Resources Research, Vol 10, No 4, p 745-752, August 1974, 3 fig, 4 tab, 5 ref.

Descriptors: *Floods, *United States, *Frequency curves, *Flood frequency, *Frequency analysis, Probability, Statistics, Peak discharge, Time series analysis.

Generalized skew coefficients for use in defining flood-frequency curves that follow log Pearson type 3 distributions are shown by isopleths on a map of conterminous United States. The generalized logarithmic skiw coefficients range from 0.6 along the eastern seaboard to -0.5 in Indiana and Illinois. West of the one-hundredth meridian the coefficients range from -0.3 to 0.2 except for a small area in Nebraska where the generalized skew goes as high as 0.4. The validity of the map values is verified by a split-sampling procedure. In the west the discharge of 50- and 100-yr peaks computed by using map values of skew is more accurate than that computed by using the observed skew of a sample of 30 annual peaks. East of the Mississippi River the accuracy is even higher and approaches the equivalent of 60 annual peaks along the east coast. An equation gives the adjustment by which a T-yr peak computed by using map skew would have to be increased to give a discharge that has an average exceedance probability equal to 1/T. (Knapp-USGS)

HYDROGEOLOGY OF THE USSR. VOLUME 15: BASHKIR ASSR (GIDROGEOLOGIYA SSSR. TOM XV. BASHKIRSKAYA ASSR).
Vsesoyuznyi Nauchno-Issledovatelskii Institut Gidrogeologii i Inzhenernoy Geologii, Moscow (USSR).
Izdatel'stvo 'Nedra', Moscow, A. V. Sidorenko, editor-in-chief, 1972. 344 p.

Descriptors: *Hydrogeology, *Groundwater, *Groundwater basins, *Aquifers, *Artesian aquifers, Confined water, Springs, Engineering geology, Geomorphology, Karst, Mountains, Structural geology, Stratigraphy, Geologic time, Water types, Water chemistry, Water utilization, Water supply, Water conservation, Natural resources.
Identifiers: *USSR(Bashkir ASSR), Tectonics.

Data summarized in Volume 15 in the series 'Hydrogeology of the USSR'(Bashkir ASSR) were based on small- and medium-scale surveys during a study of mineral deposits, groundwater regime and karst phenomena, and on geologic-engineering investigations and exploratory drilling for oil and gas. Physiographic conditions, geologic structure, and physio-geologic phenomena in the Republic are viewed as factors influencing the distribution and formation of groundwater. The Bashkir Republic is divided into two hydrogeologic regions: the Volga-Kama artesian basin and the basin containing interstitial waters of the Ural fold mountains. Twenty-five hydrostratigraphic units (aquifer horizons, aquifer complexes, and waters of sporadic occurrence) are identified in the Volga-Kama basin in deposits ranging in age from the Upper Proterozoic to the Quaternary. In the second region groundwater within the zone of regional fractures is analyzed on the basis of stratigraphic subdivisions represented by metamorphic and volcanogenic formations similar in hydrophysical properties and ranging in age from the Upper Proterozoic to the Carboniferous. Artesian waters are confined to carbonate rocks of the Upper Proterozoic, Carboniferous, and to loose formations dating from the Triassic to the Quaternary. Basic patterns in the formation, movement, and hydrochemical zonality of groundwater are given for these regions. Natural fresh groundwater resources and foreseeable supplies are computed for the Republic, and distribution of fresh groundwater in zoned. Problems of present and future groundwater use for water supply and of groundwater protection from depletion and contamination are discussed, and the role of groundwater in the development of mineral deposits is noted. Identifiers: *USSR(Kamchatka), *Kuril Islands(USSR), *Komandorskiye Islands(USSR), Tectonics, Balneology.

Volume 29 in the series 'Hydrogeology of the USSR' is the first summary work on the hydrogeology and engineering geology of Kamchatka, the Kurils, and Komandorskiye Islands. Kamchatka and the Kurils are the only regions of recent volcanism in the USSR and uniquely affect groundwater formation. A high degree of seismic activity and widespread development of recent tectonic disturbances, intensive mountain-building volcanic processes, and an intense geothermal regime have combined to produce extensively developed hydrothermal systems with numerous exposed sources of discharge of highly thermal waters, vapors, and gases. Besides a description of aquifer horizons, attention is directed to an examination of the patterns of distribution and formation of different types of thermal water in regions of active and extinct volcanoes. Maps, prepared on the basis of modern scientific concepts of the structural geology of Kamchatka, reflect the hydrogeologic zoning of major aquifer horizons and complexes of fresh and mineral waters and the distribution characteristics of different volcanic structures, hydrothermal systems, and artesian sedimentation basins. Natural freshwater resources and yield, present and future water supply, and balneological and thermal-energy resources are described, and characteristics and possibilities of groundwater use in prospecting for mineral deposits are examined. Descriptors: *Hydrogeology, *Groundwater, *Groundwater basins, *Aquifers, *Engineering geology, Geomorphology, Geologic mapping, Geologic time, Water utilization, Water supply, Water conservation, Water chemistry, Water analysis, Sampling, Water types, Confined water, Freshwater, Mineral water, Thermal water, Water wells.
Identifiers: *USSR(Turkmen SSR), Tectonics.

Volume 38 in the series 'Hydrogeology of the USSR' contains a detailed description of groundwater in the Turkmen SSR in Soviet Central Asia. Results are presented of long-term investigations of hydrogeologic and geologic-engineering conditions and of basic trends in groundwater use in the national economy of the Republic. A hydrogeologic map of the Republic at a scale of 1:1,500,000 and a catalog of chemical analysis of water samples are appended. (Josefson-USGS)

HYDROGEOLOGY OF THE USSR. VOLUME 40: KIRGIZ SSR (GIDROGEOLOGIYA SSSR. TOM XL. KIRGIZSKAYA SSR).
Vsesoyuznyi Nauchno-Issledovatelskii Institut Gidrogeologii i Inzhenernoy Geologii, Moscow (USSR).
Izdatel'stvo 'Nedra', Moscow, A. V. Sidorenko, editor-in-chief, 1971. 488 p.

Descriptors: *Hydrogeology, *Groundwater, *Groundwater resources, *Aquifers, *Engineering geology, Geomorphology, Structural geology, Geologic mapping, Stratigraphy, Geologic time, Water types, Mineral water, Industrial water, Thermal water, Confined water, Springs, Water wells, Water chemistry, Water utilization, Zoning.
Identifiers: *USSR(Kirgiz SSR), Tectonics.

Volume 40 in the series 'Hydrogeology of the USSR' is devoted to a description of hydrogeologic and engineering-geologic conditions in the Kirgiz SSR in Soviet Central Asia. A history of hydrogeologic and engineering-geologic investigations in the Republic covers a period from 1857 to the present. Basic factors influencing formation and distribution of groundwater include topography, hydrography, climate, soils and vegetation, lithology, tectonics, and geomorphology. Groundwater, including mineral, industrial, and thermal waters, is described, and role of groundwater resources in the national economy of the Republic is discussed. Two hydrogeologic provinces are identified: the Tien-Shan and Pamir-Alay, which are subdivided into regions and subregions representing specific types of artesian basins and hydrogeologic massifs. Special attention is given to the present state and prospects of groundwater use and to groundwater conservation and hydrogeology of mineral deposits. A catalog of wells and springs is appended. (Josefson-USGS)

GROUNDWATER BASIC DATA FOR ADAMS AND BOWMAN COUNTIES, NORTH DAKOTA,
Geological Survey, Bismarck, N. Dak.
M. G. Croft.
North Dakota Water Commission County Ground-Water Studies 22--Part II and North Dakota Geological Survey Bulletin 65--Part II, 1974. 294 p, 2 fig, 2 plate, 9 tab, 25 ref.

Descriptors: *Basic data collections, *North Dakota, *Groundwater, *Hydrologic data, Water levels, Hydrogeology, Electrical well logging, Borehole geophysics, Water analysis, Trace elements, Aquifer characteristics, Hydraulic conductivity, Porosity.
Identifiers: Adams County(ND), Bowman County(ND).

Detailed geologic and hydrologic data were collected to use for the orderly development of water supplies for municipal, domestic, livestock, irrigation, and industrial uses in Adams and Bowman Counties, North Dakota. The data consist of geologic and hydrologic records for 910 wells and test holes; water-level measurements in 54 observation wells; lithologic and geophysical logs of 521 test holes and wells; 232 chemical analyses of groundwater; 68 chemical analyses of water from streams and reservoirs; five analyses of minor elements in water from wells and streams; three particle-size distribution graphs of sand from an aquifer; and 11 hydraulic conductivity and porosity values determined by laboratory tests. HYDROGEOLOGY OF GLACIAL DRIFT, MESABI IRON RANGE, NORTHEASTERN MINNESOTA,
Geological Survey, Washington, D.C.
T. C. Winter.
Available from GPO, Washington, D C 20402, Price $2.10 paper copy. Water-Supply Paper 2029-A, 1973. 23 p, 6 fig, 1 tab, 23 ref.

Descriptors: *Hydrogeology, *Glacial drift, *Minnesota, *Water yield, Till, Aquifers, Transmissivity, Gravels, Sands, Water resources, Hydrologic data.
Identifiers: *Mesabi Iron Range(Minn).

Stratified fluvial sediments occur within the glacial drift at many places in the Mesabi Iron Range area of Minnesota. These sediments, which are important aquifers, occur extensively between the three main till units. The thickest and most extensive aquifer lies between the surficial till and the middle till unit, the bouldery till. This stratigraphic interval is greater than 50 feet thick in much of the area, and transmissivity is greater than 100,000 gallons per day per foot in some places. Glaciofluvial sediments underlying the bouldery till occur in the western half of the area and are generally less than 50 feet thick, and transmissivity is generally less than 50,000 gallons per day per foot. Surficial glaciofluvial sediments are a sources of groundwater for high-yield wells only in the eastern part of the area. Thickness of these sediments is greater than 100 feet in some places, but transmissivity is generally less than 50,000 gallons per day per foot. Practical sustained yield of aquifers in glacial drift is estimated to be as much as 40 million gallons per day from known aquifers, and assuming that the ratio of area underlain by aquifer to total area is constant for the study area (about 20% where mapped in detail), as much as 80 million gallons per day could be developed from all glacial-drift aquifers. (Knapp-USGS)

GALERKIN APPROXIMATION OF THE TIME DERIVATIVE IN THE FINITE ELEMENT ANALYSIS OF GROUNDWATER FLOW,
Princeton Univ., N.J. Dept. of Civil and Geological Engineering.
W. G. Gray, and G. F. Pinder.
Water Resources Research, Vol 10, No 4, p 821-828, August 1974. 6 fig, 2 tab, 12 ref.

Descriptors: *Finite element analysis, *Groundwater movement, Mathematical models, Simulation analysis, Numerical analysis, Time series analysis.
Identifiers: *Galerkin method.

The Galerkin method of approximation permits a high-order approximation in time as well as in space in finite element analysis of groundwater movement. The resulting approximate equations may successfully be solved by using a prismatic element with triangular cross section. The time axis runs the length of the prism and is subdivided into elements that may be linear, quadratic, or cubic. Because this formulation requires in general the solution for several time levels simultaneously, there is a resulting increase in computer time required to solve the larger matrix. Numerical experiments indicate that the selection of an optimum numerical scheme is dependent not only on the particular problem considered but also on the sequence of time steps used. (Knapp-USGS)
W74-11423

NONLINEAR TECHNOLOGICAL FUNCTIONS FOR AQUIFERS WHOSE TRANSMISSIVITIES VARY WITH DRAWDOWN,
Geological Survey, Reston, Va.
T. Maddock, III.
Water Resources Research, Vol 10, No 4, p 877-881, August 1974. 1 fig, 7 ref.

Descriptors: *Drawdown, *Transmissivity, *Aquifers, *Water level fluctuations, *Unsteady flow, Aquifer testing, Water table, Mathematical studies, Equations.
Identifiers: *Algebraic Technological Function, *Boussinesq equation.

An algebraic technological function (ATF) exists for an aquifer whose flow to wells can be remodeled by Boussinesq's equation. Drawdown is an infinite power series in pumping values, and the ATF is provided by a finite sum of the power series. The number of terms necessary for the finite sum to provide a good approximation to the infinite series depends on a ratio of drawdown to saturated thickness. The ATF can be used in optimization techniques or as a method for predicting drawdowns from pumping. (Knapp-USGS)

GROUNDWATER DISCHARGE FROM THE EDWARDS AND ASSOCIATED LIMESTONES, SAN ANTONIO AREA, TEXAS, 1973,
Geological Survey, Austin, Tex.
R. A. Rappmund.
Edwards Underground Water District Bulletin 32, July 1974. 9 p, 1 tab, 13 ref.

Descriptors: *Discharge(Water), *Springs, *Water wells, *Texas, Karst, Limestones, Aquifers, Water yield, Data collections, Basic data collections, Hydrologic data.
Identifiers: *Edwards aquifer(TX).

The estimated total well and spring discharge from the Edwards and associated limestones in the San Antonio area of Texas during 1973 was 838,000 acre-ft, which is the record high for the period 1934-73. The increase was due primarily to above-average springflow. The total discharge for 1973 was about 12% more than in 1972, and 53% greater than the average for 1934-72. About 37% of the total discharge came from wells, and approximately two-thirds of this discharge was from wells in Bexar County. Well discharge in 1973 was 16%

less than in 1972, while springflow increased by about 41%. (Knapp-USGS)

INTERACTION OF TEMPERATURE AND MOISTURE ON IRON AND MANGANESE AVAILABILITY IN SOILS,
Quebec Ministere de l'Agriculture et de la Colonisation. Div. of Soils.
B. T. Cheng, G. J. Quellette, and S. J. Bourget.
Nat Can (Que). Vol 99, No 5, p 515-521. 1972.
Identifiers: *Iron *Manganese, *Soil moisture, *Soil temperature, *Canada, Soil chemistry.

The influence of moisture and temperature on Mn and Fe status in 2 Quebec (Canada) soil types was investigated under incubation room conditions. Increasing soil temperature from 272 degrees K to 305 degrees K resulted in a definite increase of exchangeable Mn and Fe in both saturated soils. The amount of exchangeable Mn in Platon soil was 2 1/2 times higher when kept at 305 degrees K and 200% field moisture capabity than when kept at 239 degrees K and dry. There was approximately 12 times more exchangeable Mn in Tilly soil samples which were subjected to the highest temperature and moisture treatments than in those subjected to low moisture and temperature. The corresponding values in the case of exchangeable Fe were 33 for Platon soil and 14 for Tilly soil. There was no significant difference in any of the data comparing 239 degrees K with 272 degrees K. Soil moisture levels of 60% field capacity or less resulted in no significant effect of soil temperature on the release of exchangeable Fe and Mn.--Copyright 1973, Biological Abstracts, Inc.

SOME FEATURES OF WATER INFILTRATION INTO SOIL DURING SPRINKLER IRRIGATION (NEKOTORYYE OSOBENNOSTI VPITYVANIYA VLAGI V POCHVU PRI DOZHDEVANII),
V. M. Sorochkin.
Pochvovedeniye, No 8, p 60-67, August 1973. 1 fig, 6 tab, 9 ref.

Descriptors: *Soil physics, *Infiltration, *Infiltration rates, *Sprinkler irrigation, *Rainfall simulators, Simulated rainfall, Precipitation(Atmospheric), Rainfall intensity, Irrigation practices, Rates of application, Soil types, Soil moisture, Soil properties, Particle size, Correlation analysis, Equations, Curves.
Identifiers: *USSR, *Transvolga Region, *Moscow Oblast.

The infiltration capacity of Chestnut loam at the southern tip of the Northern Transvolga Region and of Sod-Podzolic loam in the Moscow Oblast was investigated. Dynamics of infiltration during sprinkler irrigation is adequately approximated by the Kostyakov equation. The rate of infiltration in the absence of a free surface depends on rainfall intensity. The coefficient of proportionality between these indices ranged from 27% to 54% in individual experiments, the higher values relating to the first irrigation at low rates of application. Infiltration capacity of soil during sprinkler irrigation was found to depend on makeup of the plow layer, state of the soil surface, and soil moisture content. Sprinkling reduced the infiltration capacity of soil, reducing it by 25%-30% after the first sprinkling and by about 50% after the second. (Josefson-USGS)
W74-11013

AN IMPROVED FIELD METHOD FOR DETERMINATION OF DISCONTINUOUS CAPILLARY MOISTURE (USOVERSHENSTVOVANNYY POLEVOY METOD OPREDELENIYA VLAZHNOSTI RAZRYVA KAPILLYARNOY SVYAZI),
A. P. Kovtun.
Pochvovedeniye, No 8, p 121-123, August 1973. 1 fig, 3 tab.

Descriptors: *Soil moisture, *Capillary water, *Capillary action, *Analytical techniques, *On-site tests, Instrumentation, Forest soils, Soil properties, Particle size, Soil profiles.
Identifiers: *USSR, Soil monoliths.

An improved field method of determining discontinuous capillary moisture, based on the use of a ventilation device, is proposed and described. Compared with the method of field soil monoliths, this method can be used to determine discontinuous capillary moisture with greater accuracy throughout the entire soil profile and under any weather conditions in summer without the need of observers. Particle-size composition and hydrophysical properties of moderately-eroded Dark-Gray Forest Soil on loess in the summer of 1970 are tabulated. (Josefson-USGS)

RELATIONSHIP BETWEEN COEFFICIENTS OF HEAT CONDUCTIVITY AND THERMAL MOISTURE CONDUCTIVITY OF SOILS (O SVYAZI MEZHDU KOEFFITSIYENTAMI TEMPERATUROPROVODNOSTI I TERMOVLAGOPROVODNOSTI V POCHVAKH),
Akademiya Nauk Azerbaidzhanskoi SSR, Baku. Institut Pochvovedeniya i Agrokhimii.
A. P. Gerayzade.
Pochvovedeniye, No 8, p 124-127, August 1973. 3 fig, 3 ref.

Descriptors: *Soil types, *Soil moisture, *Moisture content, *Thermal conductivity, Soil properties, Soil density, Bulk density, Equations.
Identifiers: USSR.

Coefficients of heat conductivity and thermal moisture conductivity of soils were determined as a function of soil moisture content and density. Empirical equations are given for these relationships. A formula is derived which expresses a linear relation between the coefficients of heat conductivity and thermal moisture conductivity for each fixed density value. Heat conductivity and thermal moisture conductivity as a function of moisture content and bulk density of Yellow Earth and Meadow Sierozem are diagrammed. (Josefson-USGS)

EFFECT OF DIFFERENT LEVELS OF N-NUTRITION OF GRASS SPECIES UPON THEIR PERSISTENCY, HAY PRODUCTION AND THE CONTENT OF N-MATTER ON TEMPORARY SWAMP SITES, (IN CZECH),
F. Krajicek.
Ved Pr Vysk Ustavu Luk Pasienkov Banskej Bystrici. 8 p 97-109. 1972, Illus. English summary.

Descriptors: *Grasses, Nitrogen, Swamps.

Fourteen grass species and a meadow mixture were studied on a temporary water logged meadow site on medium soil, at a nutrient level of 100 and 200kg pure nitrients (p.n.)/ha. The study included hay production, N-matter contents, N-matter production and botanical changes of the sward. Festuca pratensis Huds., Lolium perenne L., Poa palustris L., Agrostis stolonifera L., are more efficient at a nutrient level of N 100kg p.n./ha; Dactylis glomerata L., Phleum pratense L., Poa pratensis L., Alopecurus pratensis L., at a nutrient level of 200kg p.n. N/ha. Phleum pratense L,, Poa pratensis L., Alopecurus pratensis L. and Dactylis glomerata L. were the most persistent. At an application rate 100kg p.n. N/ha Poa palustris L., Baldingera arundinacea (L) Dumort (Phalaris) and Phleum pratense L. are best; at a 200Kg p.n. N/ha rate P. pratense L., B. arudinacea (L) Dumort and Poa pratensis L. are best.--Copyright 1974, Biological Abstracts, Inc.

Dedinovskaya Opytnaya Stantsiya po Poimennomu Lugovodstvu (USSR).
M. S. Kononov.
Pochvovedeniye, No 10, p 66-79, October 1973. 2 fig, 9 tab, 8 ref.

Descriptors: *Soil moisture, *Soil water movement, *Soil-water-plant relationships, *Grasslands, *Flood plains, Water levels, Water table, Available water, Groundwater, Capillary action, Field capacity, Recharge, Flooding, Precipitation(Atmospheric), Evapotranspiration, Wilting point, Soil properties, Particle size, Meteorology, Air temperature.
Identifiers: *USSR(Oka River).

Water regime of soils on the flood plain of the Oka River in central European Russia was investigated

in 1966-70. A stable soil moisture content, resulting from capillary recharge by groundwater, is a necessary condition for high productivity of a natural flood-plain meadow. Productivity of a meadow decreases as the water table drops. A high productivity is characteristic of meadows which are continuously recharged by groundwater to the soil surface and where the amount of available water in the upper soil layer (0-20 cm) during the growing season is above 20 mm. Meadows where capillary recharge in summer does not always reach the surface and amount of available water in the top meter layer of soil exceeds 100 mm are quite productive but experience strong yearly fluctuations in yield and require irrigation during dry periods. (Josefson-USGS)

FALL-WINTER DEVELOPMENT OF THE BUDS OF SOME TREES IN RELATION TO SOIL MOISTURE CONTENT, (IN BYELORUSSIAN),
Akademiya Navuk BSSR, Minsk. Inst. of Experimental Botany.
M. D. Nyestsyarovich, and A. A. Novikava.
Vyestsi Akad Navuk BSSR Syer Biyal Navuk. 1 p 5-9, 1973.

Descriptors: *Soil moisture.
Identifiers: Birch, Buds, Linden, Oak.

The length, thickness and internal structure of buds during dormancy in 30-yr pedunculate oak, cut-leaf linden, and common birch grown in Minsk, USSR, with different soil moisture content were studied in Sept.-May 1969-1971. During dormancy the length and thickness of the buds varied with soil moisture content. A slight decrease in bud length and thickness was noted following a marked decrease of air temperature (Dec., Jan.); with an increase of temperature the buds reached their original size. The buds began to increase in size in March. Growth processes did not occur during dormancy in the buds at different soil moisture levels; the number of bud elements remained constant.--Copyright 1974, Biological Abstracts, Inc.

NITROGEN MINERALIZATION POTENTIALS OF SOILS,
Agricultural Research Service, Beltsville, Md. Soils Lab.
G. Stanford, and S. J. Smith.
Soil Science Society of America Proceedings, Vol 36, No 3, p 465-472, May-June, 1972. 2 fig, 5 tab, 16 ref.

Descriptors: *Nutrient removal, *Nitrogen, Leaching, Nitrogen fixation, Incubation, *Mineralogy, Aerobic conditions, Water pollution sources.

Net mineralization of N in 39 widely differing soils was determined during a 30-week period at 35C, using incubation intervals of 2, 2, 4, 4, 4, 6, and 8 weeks. Mineral N was leached from the soils before the first incubation and following each of seven incubations by means of 0.01M CaC12 and a minus-N nutrient solution. Soilwater contents were adjusted by applying suction, and losses of water during incubation under aerobic conditions were negligible. With most soils, cumulative net N mineralized was linearly related to the square root of time. The pH of soils changed very little in the course of 30 weeks' incubation. Because of the generally consistent results, the data were employed in calculating the N mineralization potential, No, of each soil, based on the hypothesis that rate of N mineralization was proportional to the quantity of N comprising the mineralizable substrate. Values of No varied from about 20 to more than 300 ppm of air-dry soil. The fraction of total N comprising No varied widely among soils. Mineralization rate constants did not differ significantly among most of the soils. (Skogerboe-Colorado State)
W74-11272

DETERMINATION OF TOTAL PHOSPHOROUS IN SOILS: A RAPID PERCHLORIC ACID DIGESTION PROCEDURE,
Purdue Univ., Lafayette, Ind. Agricultural Experiment Station.
L. E. Sommers, and D. W. Nelson.
Soil Science Society of America Proceedings, Vol 36, No 6, p 902-904, November-December, 1972. 4 tab, 17 ref.

Descriptors: *Fertility, *Phosphorous, Phosphates, Nutrients, Soil chemical properties, Soil properties, Topsoil, *Pollutant identification, Water pollution sources.

Extraction and colorimetric methods were evaluated for determining total P in soils. A procedure involving simultaneous digestion of 60 soil samples with perchloric acid and determination of extracted orthophosphate with an ascorbic acid method was evaluated. Analysis of diverse soils indicated that the proposed and conventional HClO4 digestion procedures yielded essentially the same total P values; however, both HClO4 methods underestimated total P by 1-6% when compared to Na2CO3 fusion. A comparison of colorimetric orthophosphate procedures indicated the method of Murphy and Riley (1962) was suitable for determination of orthophosphate following either HClO4 digestion or Na2CO3 fusion. Determination of total P in soils by tube HClO4 digestion and estima tion of extracted P by the method of Murphy and Riley (1962) enables rapid and precise estimation of total P in a wide range of soils. (Skogerboe-Colorado State)

SOIL-SUCTION MEASUREMENTS FOR EVALUATION OF VERTICAL WATER FLOW AT GREATER DEPTHS WITH A PRESSURE TRANSDUCER TENSIOMETER,
Niedersachsisches Landesamt fuer Bodenforschung, Hannover (West Germany).
O. Strebel, M. Renger, and W. Giesel.
Journal of Hydrology, Vol 18, No 3/4, p 367-370, March, 1973. 2 fig, 6 ref.

Descriptors: *Soil water, *Soil moisture, *Tensiometers, Moisture tension, Soilwater movement, Available water, Measurement.
Identifiers: *Soil suction measurements.

Periodic suction measurements at greater depths can be carried out in cased boreholes using a temporarily installed pressure transducer tensiometer. The time needed to reach constant suction values depends upon the tensiometer prestressing and the soil suction, and amounts to about 15 min to 2.5 hr according to general experience. With this technique, requiring relatively low expense for instruments, the hydraulic gradient and-combined with corresponding hydraulic conductivity values-the vertical water flow can be determined at depths up to about 10 m. CLASSIFICATION OF SANDS IN THE TEDZHEN DELTA, (IN RUSSIAN),
Desert Inst., Ashkhabad (USSR).
M. Khudaiyarov.
Probl Osvoeniya Pustyn'. p 2, 74-78, 1973. English summary.

Descriptors: *Sands, Classification.
Identifiers: Tedzhen(USSR).

Based on field and laboratory data, sands of the river Tedzhen delta (Turkmen SSR, USSR) are characterized. They are divided into three principal groups with nine types and 26 subtypes. Coppice-mound, slightly undulating, and small hummock sands including takyr-like depressions are suitable for irrigation. The total area of these sands in the river delta is 155,000 ha. The area under barkhan, barkhan-hymmocky and barkhan-ridgy sands are suitable for phytomelioration. Ridgy, ridgy-hummocky and net sands are used and should be used in future as grazing lands.--Copyright 1974, Biological Abstracts, Inc.

MOLECULAR SIZE AND SPECTRAL CHARACTERIZATION OF ORGANIC MATTER IN A MEROMICTIC LAKE,
British Columbia Univ., Vancouver. Dept. of Civil Engineering.
K. J. Hall, and G. F. Lee.
Water Research, Vol 8, No 4, p 239-251, April, 1974. 10 fig, 3 tab, 36 ref.

Descriptors: *Water pollution sources, *Solid wastes, *Lakes, *Meromixis, *Biodegradation, *Leachate, *Decomposing organic water, Leaves, Fluorescence, Degradation(Decomposition), Organic matter, Molecular structure, Spectroscopy, Litter, Forest soils, Leaching, Organic compounds.
Identifiers: *Molecular weight, Lake Mary(WI), Chromophores, Aromatic compounds.

Gel filtration was used to investigate the properties of natural organic matter in Lake Mary, Vilas County, Wisconsin. The organic matter from the meromictic lake and leaf litter consisted of a series of molecular weight fractions (from longer than 50,000 to less than 700) with different color and fluorescence properties. The soluble leaf organic matter contained a higher percentage of the high molecular weight components than did lake water, demonstrating that partial degradation was occurring as it was leached from the forest floor into the lake. The degradation resulted in destruction of some of the color-producing structures and enhancement of the fluorescence in the lake organic matter. The identification of six aromatic subunits (dibutyl phthalate, vanillin, catechol, 4-hydroxyacetophenone, 3,5-dihydroxybenzoic acid, and resorcinol) in degraded organic matter demonstrated that this material contained an aromatic skeletal structure with oxygen-containing functional groups (hydroxyl and carbonyl). Different molecular size fractions possessed similar chemical subunits although infrared spectra of undegraded material suggested some differences in the aliphatic C-H stretching and bending and the C-O stretching frequencies of the intact molecules. Some evidence is provided that ether, ester, and alkyl bonds link these aromatic subunits to form part of the structure of this complex natural organic matter. (Witt-IPC)

CONTRIBUTIONS TO THE COMPARATIVE STUDY OF THE SEASONAL BIORHYTHM OF GONADS AND PITUITARY NUCLEI ACIDS IN CTENOPHARYNGODON IDELIA (VAL.) REARED IN PONDS OR LIVING IN NATURAL WATERS, (IN RUMANIAN),
R. Giurca.
Bul Cercet Piscic. Vol 31, No 1/2 p 45-54, 1972. Illus. (English summary).

Descriptors: *Carp, Fish physiology.
Identifiers: Ctenopharyngodon idella, Gonads, Pituitary.

Biochemical analyses were made in grass carp (C. idella, 5,9 and 11 yr old specimens), reared in ponds. The seasonal biorhythm of gonadal and pituitary RNA and DNA was determined by spectrophotometric analyses. Spectrophotometric studies were also made on 5,6,7 and 8 yr old specimens of C. idella captured in the low Danube. The characteristics of mature grass carps caught in the low Danube and the growth rate differences between fishes living in natural waters and those reared in ponds were shown. The possibility of natural spawning in the Danube of C. idella was also discussed.--Copyright 1974, Biological Abstracts, Inc.

SEASONAL AND AGE-RELATED FEEDING CHANGES OF BROOK TROUT IN LITHUANIAN SPRING BROOKS, (IN RUSSIAN),
Akademiya Nauk Litovskoi SSR, Vilnius. Institut Zoologii i Parazitologii.
A. K. Kublitskak, and V. T. Sukatskas.
Liet Tsr Moksiu Akad Darb Ser B. 1. p 175-182. 1973. English summary.

Descriptors: *Trout, Streams, Aquatic insects.
Identifiers: Chironomidae, Crustacea, Ephemeroptera, Frogs, Lithuania, Salmo Trutta, Trichoptera.

Trout (Salmo trutta m. fario) (421 units) food composition changes according to the season of the year, the age of the fish and its size. In the course of the first year trout young feed mainly on aquatic insects, namely the larvae of Chironomidae, Ephemeroptera and Trichoptera. The digestive tract of fish young also contain many specimens of adult insects. In the autumn trout young began to feed on the larger forms of benthic organisms, especially worms and crustaceans. In autumn adult trout usually feed on frogs. Fish is not important as food to trout living in spring brooks since it comprises less than 4% of the ration for the trout. Maximum indices of intestinal fill-up are found in the autumn and early spring.--Copyright 1974, Biological Abstracts, Inc.

EVOLUTION OF THE PLANKTON BIOCENOSIS OF LAKE ANNECY, (IN FRENCH),
Institut National de la Recherche Agronomique, Thonon-les-Bains (France). Station d'Hydrobiologie Lacustre.
G. Balvay.
Ann Hydrobiol. Vol 3, No 2, p 93-116, 1972, Illus. English summary.

Descriptors: *Plankton, Lakes.
Identifiers: France, Lake Annecy.

An ecological plankton study as carried out in 1965 and 1966 in Lake Annecy ((France) Haute-Savoie) is described. The changes in the physico-chemical water characteristics and the plankton composition indicate that the lake, already changing in 1937, had become strongly eutrophic in the mid 1960's. The construction at that time of a now partly completed peripheral sewage collecting system, which releases the treated waters below the lake's outflow, has since 1968 shown an improvement in the physico-chemical conditions and the plankton biocenosis. This improvement appears correlated with the construction and gradual extension of the lakeshore sewer.--Copyright 1974, Biological Abstracts, Inc.

GALLTRASKET: THE GEOLOGICAL DEVELOPMENT AND PALAEOLIMNOLOGY OF A SMALL POLLUTED LAKE IN SOUTHERN FINLAND,
Helsinki Univ. (Finland). Dept. of Geology and Paleontology.
P. Alhonen.
Comment Biol Soc Sci Fenn. 57. p 1-34, 1972, Illus.

Descriptors: *Lakes, *Bottom sediments, *Diatoms, Eutrophication, Chlorophyll.
Identifiers: Finland, Galltrasket.

The bottom sediments of Galltrasket provide information on 2 main aspects of its history, viz., fluctuations in its water level and a rapid eutrophi-

cation. These fluctuations are reflected in the planktonic/littoral ratio of the subfossil cladoceran fauna, and it would appear that the bathymetric and morphometric development of Galltrasket correlate with the original Blytt Sernander climatic scheme. The changes in the proportions of diatoms inhabiting certain biotopes also reflect this climatic development. During the history of Galltrasket there were 2 high water periods, corresponding to the Atlantic and Sub-Atlantic times, and 1 clear low water period correlating with the Sub-Boreal. The dynamics of lake exosystems seems to be of general significance for Quaternary research, particularly as evidence of climatic changes. Judged by its diatom stratigraphy, Galltrasket has probably been more or less eutrophic throughout its history. A relatively rapid increase in productivity can be seen in the uppermost part of the sedimentary column, being best indicated by an abrupt rise of the p curve and a clear increase in the chlorophyll content of the sediment. Since sewage was discharged to the lake, its productivity and nutrient content have reached a higher level than during any earlier period of its history.--Copyright 1974, Biological Abstracts, Inc.

EXPERIMENTS IN THE NUTRITION OF CARP GROWING IN CAGES,
S. Shiloh, and S. Viola.
Bamidgeh. Vol 25, No 1, p 17-31, 1973. Illus.

Descriptors: *Carp, *Fish physiology.

An experimental array of wire-cages, containing 1 m3 of water each, was highly efficient for conducting nutrition experiments with carp of 250-500 g of weight, at a stocking density of 200/cage. The cages were suspended in a fish pond, near the embankment. Experimental rations, in the form of 4 mm pellets, were fed twice daily, at the rate of 4% of the weight of the carp in the fastest growing group. Every treatment was repeated in 4 cages. The duration of 1 trial was 1 mo., approximately. The fish were weighed every 10 days. All rations contained 25% crude protein, not including certain nonprotein-nitrogen compounds of experimental ingredients, but differed in their contents of metabolizable energy. The weight increments of the carp showed a high correlation with the energy content of the rations (r=0.94, after omission of one divergent value). Sterilized cow manure or poultry litter were included in some of the experimental rations at levels of 10% and 20%. Since growth rates were reduced by these high-fiber ingredients, it was concluded that fast growing carp were unable to utilize fiber as a source of energy. Soybean oil added to the pellets increased growth rate in every trial.--Copyright 1974, Biological Abstracts, Inc.

HYDROCHEMICAL TYPING OF SMALL LAKES IN ESTONIA, (IN RUSSIAN),
Akademiya Nauk Estonskoi SSR, Tartu. Inst. of Zoology and Botany.
K. Simm.
Eesti Nsv Tead Akad Toim Biol. Vol 22, No 1, p 58-67. 1973, Illus.

Descriptors: *Lakes, Classification, Mineralogy.
Identifiers: Estonia.

Since the formation of the chemical composition of lake waters takes place under conditions of delayed water-exchange, factors that determine the water-salt balance play a decisive role in the hydrochemistry of lakes, especially the flow and seepage properties of lake basins. In Estonia USSR 150 lakes were grouped into five hydrochemical types. Type A: flowing lakes on moraine catchment areas with carbonate soils; type B: flowing lakes on stagnant catchment areas; type C: nonflowing lakes on sand catchment areas; type D: nonflowing lakes on limestone catchment areas with carbonate soils; and type E: nonflowing lakes on catchment areas of upper marshlands. Typing of lakes makes it possible to distinguish the hydrochemical features of lakes. These features consist of differences in the content of minerals, biogenic and organic substances, differences in the ion composition of mineral and differences in the fractional composition of organic substances. A close correlation between water organisms and hydrochemical conditions of the environment was established.--Copyright 1974, Biological Abstracts, Inc.

INFLUENCE OF WATER STRESS ON PHOTOSYNTHESIS, RESPIRATION AND LEAF GROWTH OF ZEA MAYS L.,
Agricultural Univ., Wageningen (Netherlands). Lab. of Plant Physiological Research.
J. C. Wesselius, and R. Brouwer.
Meded Landbouwhogesch Wageningen. Vol 72, No 33, p 1-15, 1972. Illus.

Descriptors: *Respiration, *Photosynthesis, Leaves, Corn(Field), *Osmotic pressure.

Maize exposed to drought showed reduced leaf elongation rate and reduced photosynthesis. Respiration rate was increased when the roots were exposed to 5C during a couple of days. Sensitivity towards drought was highest for leaf elongation rate, less for photosynthesis and lowest for the rate of respiration. The reduced rates of photosynthesis which were due to water shortage could not be enhanced by increasing the partial pressure of CO2 in the ambient air from 0.03% to 0.5%. It was concluded that a reduced biochemical activity was the limiting factor under these experimental conditions. Photosynthetic rates decreased from a relative water content of 100% to 85%. Relative water content of the leaf decreased to about 75-80% on the average, whereas the rate of photosynthesis still decreased. The osmotic pressure of the leaf increased and the rate of photosynthesis decreased during water stress. A nearly linear relationship existed between osmotic pressure of the leaf and rate of photosynthesis during a period of 5 hr after root cooling.--Copyright 1974, Biological Abstracts, Inc.

METHODOLOGY OF PLANT TISSUE WATER POTENTIAL DETERMINATION BY THE PSYCHROMETRIC METHOD,
Vyskymny Ustav Vodohospodarksy, Bratislava (Czechoslovakia).
L. Zila.
Biol (Bratisl). Vol 28, No 1, p 77-82, 1973. Illus.

Descriptors: *Plant tissue, *Hygrometry, Soil moisture meters.
Identifiers: Chromel, Constantan thermocouple, Peltier effect.

Determination of the water potential in plant tissues by the psychrometric method is complicated and requires a thermocouple with a measuring vessel, an efficient thermostat capable of maintaining long-term thermal stability with an exactitude of the order of 0.001C, and an evaluation galvanometer. The method and equipment described uses a chromel/constantan thermocouple with a wet connection accomplished by cooling below the dew point by the Peltier effect. The method permits assessment of the relationship between the degree of soil hydration and that of plant tissues especially under conditions of different water contents in the soil.--Copyright 1974, Biological Abstracts, Inc.

TURGOR DIFFERENCES AND WATER STRESS IN MAIZE AND SORGHUM LEAVES DURING DROUGHT AND RECOVERY,
Consejo Superior di Investigaciones Cientificas, Madrid (Spain). Instituto de Edafologia y Biologia Vegetal.
M. Sanchez-Diaz, and P. J. Kramer.
J Exp Bot. Vol 24, No 80, p 511-515, 1973. Illus.

Descriptors: Corn(Field), *Sorghum, Drought.
Identifiers: Pressure potential, Turgor pressure.

The pressure potentials (tugor pressure) in leaves of maize (Zea mays L.) and grain sorghum (Sorghum vulgare Pers.) plants subjected to water stress in a controlled environment were estimated from measurements of water and osmotic potentials. Changes in tugor pressure were larger in sorghum than in maize during the development of water stress and after rewatering. It is suggested that this indicates a lower cell wall elasticity in sorghum than in maize. This fact may affect some of the physiological activities of sorghum.--Copyright 1974, Biological Abstracts, Inc.

FREE PROLINE AND WATER DEFICIT IN PLANT TISSUES, (IN RUSSIAN),
Jozsef Attila Univ., Szeged (Hungary).
G. Palfi, M. Bito, and Z. Palfi.
Fiziol Rast. Vol 20, No 2, p 233-238, 1973. Illus. English summary.

Descriptors: *Drought.
Identifiers: Proline.

The content of free proline in plants with the optimal supply of water is usually very low (0.2-0.6 mg/g dry matter). Free proline content can rapidly rise and reach 40-50 mg during slow dehydration of the tissues. Therefore, the level of free proline ('proline test') can be used as a reliable index of the degree of water deficit of the tissues. The proline test is made by chromatographic paper impregnated with a solution of isatin and retaining its reactive ability during 2-3 yr. The proline test can be also applied for the diagnosis of 'physiological drought' due to salinization or cold soils. In combination with wilting of isolated leaves, it can be used in selection to test drought-resistance. Among 80 plant species studied, the proline test was not applicable only in those plants whose tissues contained only traces of free proline: spinach, sorrel, maize and lettuce.--Copyright 1974, Biological Abstracts, Inc.

WATER METABOLISM OF PLANTS DURING OXYGEN DEFICIENCY, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Inst. of Plant Physiology.
G. M. Grineva, and N. S. Petinov.
Izv Akad Nauk SSSR ser Biol. 1. p 13-25, 1973. Illus. English summary.

Descriptors: Corn(Field), Plant physiology, Metabolism, Oxygen requirements.

The roles of free space, membrane barriers and molecular structure of the protoplasm in the mechanism of water transport in isolated tissues and the root of a whole plant (corn) are discussed. The connection of the water regime of the plants with oxidative metabolism is analyzed. The character of water metabolism depends largely on the grade of O2 influence on various plant organs. Under conditions of local O2 deficiency of the roots the intensity of water metabolism decreases while leaf O2 deficiency increases intake, transport and output of water in contrast to normally aerated plants. The possible regulation mechanisms responsible for the appearance of 2 basic ranges of water metabolism intensity dependent on O 2 supply of various plant organs is discussed.--Copyright 1974, Biological Abstracts, Inc.

A NEW ECOPHYSIOLOGICAL APPROACH TO FOREST-WATER RELATIONSHIPS IN ARID CLIMATES,
I. Gindel.
W. Junk B. V., The Hague, 1973, 142p.

Descriptors: *Soil-Water-Plant Relationships Transpiration, Retardants, Forestry.

Various problems analyzed during ecological and morphoanatomical investigations are discussed, including the relation between anatomorphogenesis and the environment, the correlation between physical environmental conditions and biological properties of the plant and the consumption of moisture by plants and the role of atmospheric moisture in the water balance of the plant. Other problems discussed include the definition of the transpiration process as a function of other physiological processes, the stomatal system and its ecophysiological role and radiation and its

biological function. Chapters cover the following: absorption of atmospheric moisture by woody xerophytes; concentration of rainwater by means of plastic sheets; accepted transpiration concepts; transpiration during the season of growth; the xeromorphic properties of the leaf and their relationship to the process of transpiration; and transpiration suppressants. A pertinent bibliography are included.--Copyright 1974, Biological Abstracts, Inc.

Descriptors: *Soil erosion, *Overland flow, *Slopes, *Cultivated lands, *Cultivation, Crop production, Erosion control, Grasslands, Spring.
Identifiers: *USSR.

Agricultural practices, which alter the magnitude and regime of overland flow, have a significant effect on soil erosion intensity. Soil erosion is discussed in relation to the characteristics of overland flow in spring. On the basis of investigations carried out at the Kursk Field Experiment Station in 1969-71 and of data available on the subject, soil erosion patterns were established during application of different agricultural practices on the water balance of cultivated fields with varying amounts of overland flow. Erosion control on slopes with a steepness of 3-5 deg in forested-steppe zones should be directed at reducing surface retention of overland flow in spring by increasing the infiltration capacity of soil. EROSIONAL AND DEPOSITIONAL ASPECTS OF HURRICANE CAMILLE IN VIRGINIA, 1969,
Geological Survey, Washington, D.C.
G. P. Williams, and H. P. Guy.
Available from GPO, Washington, D C 20402, Price $1.80 paper copy. Professional Paper 804, 1973. 80 p, 57 fig, 11 tab, 65 ref.

Descriptors: *Erosion, *Sedimentation, *Hurricanes, *Virginia, *Debris avalanches, Landslides, Mudflows, Sediment transport, Disasters, Erosion rates, Floods, Channel erosion, Stream erosion, Mass wasting.
Identifiers: *Hurricane Camille(1969).

Erosion and sedimentation resulting from the worst natural disaster in central Virginia's recorded history, the flood resulting from an 8-hour deluge of about 28 inches of rain on the night of August 19-20, 1969, are described. Erosion resulted mainly from debris avalanches down the mountainsides and channel scour along streams and headwater tributaries. Total amounts of sediment yield from mountainous areas in Nelson County were about 3.2-4.6 million cubic feet per square mile, probably the equivalent of several thousand years of normal denudation. Characteristics of the debris avalanches were that (1) they usually followed preexisting depressions on hillsides and occurred on slopes greater than 35 percent, (2) the upslope tip of the avalanche scar tended to be located at the steepest part of the hillside, (3) hillsides facing north, northeast and east were more susceptible to avalanching than slopes facing other directions, and (4) debris-avalanches caused rapid and devastating surges of water and sediment in the stream channels. Slightly more than half of the total sediment contributed to the stream system was from erosion of stream channels. The types of sediment deposits were (1) debris-avalanche deposits, (2) mountain-stream channel deposits, (3) alluvial fans, (4) delta-like deposits at the junction of a stream and major highway, where water backed up during the flood due to plugging of a culvert, and (5) accretion deposits on flood plains. ERODIBILITY OF SOILS UNDER STORM RUNOFF CONDITIONS (ERODIRUYEMOST' POCHV V USLOVIYAKH LIVNEVOGO STOKA),
Akademiya Nauk Moldarskoi SSR, Kishinev. Otdel Geografii.
Kh. P. Bogdanov, and V. V. Slastikhin.
Pochvovedeniye, No 9, p 129-131, September 1973. 1 fig, 1 tab, 18 ref.

Descriptors: *Soils, *Soil erosion, *Erosion rates, *Surface runoff, *Sprinkler irrigation, Sprinkling, Rainfall simulators, Particle size, Slopes, Erosion control.
Identifiers: *USSR(Moldavian SSR).

Accurate estimates of soil erodibility on slopes are of particular importance in Moldavia in connection with formulation of a general plan of erosion control for 1971-80 and implementation of sprinkler irrigation of large land areas. Sprinkling experiments were carried out on Gray Forest clay loam and coarse loam and on Ordinary, Calcareous, and Leached Chernozems. A relation was established between erodibility of soils and their particle-size composition. The index of soil erodibility was calculated as the mean ratio of surface runoff (in cu m) to weight of eroded soil (in metric tons) and can be used to forecast erosion intensity on different soils. Soil erosion in metric tons/ha as a function of surface runoff in cu m/ha is diagrammed, and soil particle-size composition and index of soil erodibility are tabulated. (Josefson-USGS)

SURFACE RUNOFF AND SOIL EROSION IN FOOTHILLS OF DAGESTAN (O POVERKHNOSTNOM STOKE I SMYVE POCHV V PREDGOR'YAKH DAGESTANA),
Dagestanskii Nauchno-Issledovatelskii Institut Selskogo Khozyaistva, Makhachkala (USSR).
S. U. Kerimkhanov, and D. U. Dzhabrailov.
Pochevovedeniye, No 9, p 132-136, September 1973. 1 fig, 2 tab, 5 ref.

Descriptors: *Soil erosion, *Surface runoff, *Slopes, Overland flow, Rain water, Snowmelt, Snow cover, Water equivalent, Precipitation(Atmospheric), Erosion control.
Identifiers: *USSR(Dagestan), Foothills.

Surface runoff and soil erosion were investigated on piedmont slopes of Dagestan in 1969 and 1972. A study of overland flow of snowmelt and rainwater was carried out on northern- and southern-exposed slopes with a steepness of 8-10 deg. Observations of snowmelt runoff were conducted in southeastern and central foothills at an elevation of 300-400 m above sea level. Soil permeability on northern-exposed slopes was 0.8-1.2 mm/min and on southern-exposed slopes, 0.5-0.7 mm/min. In 1969, runoff from southern-exposed slopes was 40% higher than from northern-exposed slopes. In 1972 there was practically no runoff from southern-exposed slopes, while on northern-exposed slopes, runoff was 1.8 mm. Despite individual years with considerable precipitation occurring in the form of snow, surface runoff and soil erosion are insignificant, which precludes a need for measures to protect soils from erosion

caused by melt water. Erosion on piedmont slopes is generally caused by runoff of rainwaters. The proportion of precipitation which contributes to overland flow in the central foothills is twice that in southeastern regions. Runoff in the northwestern part is 3.7 times greater than in the southeast. (Josefson-USGS)

AN EMPIRICAL INTERMOLECULAR POTENTIAL ENERGY FUNCTION FOR WATER,
Cornell Univ., Ithaca, N.Y. Dept. of Chemistry.
L. L. Shipman, and H. A. Scheraga.
The Journal of Physical Chemistry, Vol 78, No 9, p 909-916, April 25, 1974. 6 fig, 2 tab, 53 ref.

Descriptors: *Water structure, *Molecular structure, Thermodynamics, Water properties, Theoretical analysis, Ice, Water vapor.

An empirical intermolecular potential energy function for water has been derived, using data available from experimental and theoretical studies. These data include the lattice energy, x-ray structure, compressibility, and intermolecular vibrational frequencies of ice, the gas-phase dipole and quadrupole moments, gas-phase infrared and microwave structure of the water monomer, and the localized molecular orbital structure of the water monomer. Expressions have been derived that relate various macroscopic thermodynamic properties to the intermolecular potential energy function. The contributions of the zero-point vibrational energy of ice to several of the above properties have been examined. Potential energy versus O-O distance curves for various water dimers have been calculated and compared with large basis set ab initio quantum mechanical results. The need for an adequate treatment of the quantum mechanical nature of the intermolecular motions in the water dimer in the calculation of the second virial coefficient is discussed. (Witt-IPC)

METEORIC WATER IN MAGMAS,
Geological Survey, Denver, Colo.
I. Friedman, P. W. Lipman, J. D. Obradovich, J. D. Gleason, and R. L. Christiansen.
Science, Vol 184, No 4141, p 1069-1072, June 7, 1974. 1 fig, 2 tab, 12 ref.

Descriptors: *Magmatic water, *Meteoric water, *Precipitation(Atmospheric), *Oxygen isotopes, Lava, Water types, Groundwater, Nevada, Colorado, Isotope studies, Igneous rocks, Rhyolites, Petrology.
Identifiers: *Magmas.

Oxygen isotope analyses of sanidine phenocrysts from rhyolitic sequences in Nevada, Colorado, and the Yellowstone Plateau volcanic field show that delta (18)O in these magmas decreased as a function of time. This decrease may have been caused by isotopic exchange between the magma and groundwater low in (18)O. For the Yellowstone rhyolites, 7000cu km of magma could decrease in delta (18)O by 2/mil in 600,000 years by reacting with water equivalent to 3mm of annual precipitation, which is only 0.3% of the present precipitation in this region. The possibility of reaction between large magmatic bodies and meteoric water at liquidus temperatures has major implications in the possible differentiation history of the magma and in the generation of ore deposits. (Brown-IPC)

STUDY OF THE PHYSICO-CHEMISTRY OF A RIVER SYSTEM IN THE FRENCH MORVAN: II. SEASONAL VARIATIONS AND INFLUENCE OF RESERVOIRS ON RIVERS, (IN FRENCH),
Institut National de la Recherche Agronomique, Thonon-les-Bains (France). Station d'Hydrobiologie Lacustre.
J. Feuillade.
Ann Hydrodiol. Vol 3, No 2, p 117-140. 1972. Illus. English summary.

Descriptors: *Lakes, *Reservoirs, Water chemistry, Phytoplankton, Rivers.
Identifiers: Ammonia, Iron, Magnesium, Nitrogen, Phosphorus.

This work is the continuation of one carried out in 1966-67 on lakes only. The rivers have a torrential aspect in the zone studied. The Settons reservoir warms the water getting through but retains P during maximal phytoplankton growth. This lake also retains nitrate N and releases ammonia. The Chaumecon reservoir which is deep and with effluent water from the base of the dam cools water getting through it between winter and late summer. This lake is an Fe and P trap. It releases in the river by-products from organic matter in the oxidized form: nitrate N and sulfate. The Crescent reservoir is deep but only gives a poor flow of deep water in the river. It is without important thermic activity on these waters. The waters flowing from this lake are much enriched with dissolved substances, specially with reduced Fe. All correlation coefficients and canonic variables were calculated with a computer. Some correlations are pointed out by graphic methods. Flow variations are of little importance on water physico-chemistry. The Chaumecon reservoir has a good action in the water flowing through it. The Crescent reservoir has a noxious action.--Copyright 1974, Biological Abstracts, Inc.

DISSOLVED OXYGEN AND PRIMARY PRODUCTION IN HYPERTROPHIC SHALLOW LAKES IN THE DISTRICT OF THE RIVER HAVEL,
Wasserwirtschaftsdirektion Havel, Potsdam (East Germany).
L. Kalbe.
Int Rev Gesamten Hydrobiol. Vol 57, No 6, p 825-862, 1972, Illus. English summary.

Descriptors: *Dissolved oxygen, *Lakes, Phytoplankton, Ducks(Domestic), *Primary productivity.
Identifiers: East Germany, Havel River.

Three shallow lakes with domestic ducks in the District of the River Havel (East Germany) in the years 1966-1969 were studied. In consequence of large imports of nutritive substances from domestic ducks and waste water, large amounts of N salts and P were found at all times of the year. The diurnal curves show important differences of the amount of dissolved O2 at night compared to that during the day. The maximum daily primary production in 1 of these lakes, the Grossin-See, was 10.9 gC/cu m. The entire population is the cause of long-term tendencies for the amount of dissolved O2 to increase and decrease. This is an expression of the variable activity of the phytoplankton. Some possible methods for primary production measurements were used. Odum's method of interpretation of diurnal curves should be preferred.--Copyright 1974, Biological Abstracts, Inc.

A STUDY ON THE FRACTIONATION OF ORGANIC MATTER IN NATURAL WATER BY ULTRAFILTRATION TECHNIQUES,
National Swedish Environment Protection Board, Uppsala.
A. Wilander.
Schweiz Z Hydrol. Vol 34, No 2, p 190-200, 1972. Illus.

Descriptors: *Organic matter, *Distillation, *Filtration.

Ultrafiltration is one method for discrete separation of high and low molecular weight organic substances in natural water. Diaflo filters with nominal molecular weight cutoffs at 1000 and 10,000 have been used. The UM 2 filter has been specially studies with respect to retention of inorganic and organic substances. With the described procedure the retention varied from -4% for Na to 72% for Mg. The binding of Ca by organic substances in natural water is between 1 and 10%. The retention of some nutrients was also studied, varying from 27% for nitrate to 77% for phosphate. The retention of natural organic matter was 66-94% when measured as permanganate comsumption and 84-99% when measured as absorbance. With the UM 10 filter the mean retention of colored matter was 95 and with PM 10 36%.--Copyright 1974, Biological Abstracts, Inc.

DATA BANK INVENTORY: VOL. II--CHESAPEAKE BAY, EDITION 1, 1949 THROUGH 1970,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
C. Feister, and M. Karweit.
Available from NTIS, Springfield, Va. 22161 AD-761 184, Price $3.50 printed copy; $2.25 microfiche. Data Bank Report 2, Reference 73-5, January 1973. 45 p, 3 append. ONR Contract N00014-67-A-0163-0006.

Descriptors: *Data collections, *Hydrologic data, *Chesapeake Bay, *Information exchange, Data storage and retrieval, Oceanography, Basic data collections.

The Chesapeake Bay Institute (CBI) maintains a bank of information consisting of all oceanographic data collected by CPI on the Chesapeake Bay and its tributaries. Since 1949 CBI has gathered data both for specific projects and for general surveys. Much of it has been published as individual cruise reports, but never collated in a way to make it generally accessible for secondary use. Recently a complete reorganization of this data bank was undertaken to promote better utilization of its contents. (Knapp-USGS)

COMPUTATION OF FLOW THROUGH MASONBORO INLET, N.C.,
North Carolina State Univ., Raleigh. Dept. of Civil Engineering.
M. Amein.
Sea Grant Publication 73-15, July 1973. 45 p, 14 fig, 3 tab, 17 ref. NOAA Grants 2-35178 and 04-3-158-40.

Descriptors: *Open channel flow, *Inlets(Waterways), *North Carolina, Estuaries, Tides, Streamflow, Channels, Lagoons, Mathematical models, Finite element analysis, Unsteady flow.
Identifiers: *Masonboro Inlet(NC).

The flow through the Masonboro Inlet, North Carolina system was computed by means of a numerical simulation model based on the equations of unsteady flow which represent the laws for the conservation of mass and momentum. The Masonboro Inlet system is a complex arrangement of channels connecting the coastal waterways to the Atlantic Ocean. An implicit method was used to find the solutions for the finite difference equations. The method requires that the basic equations be satisfied at all locations simultaneously. A comparison of the computed results with the field observations demonstrates the accuracy, reliability, and efficiency of the method. It is believed that the simulation model can handle other inlets, which are generally much simpler than the Masonboro Inlet, with little difficulty. (Knapp-USGS)

REPRODUCTION OF THE BLOODWORM (GLYCERA DIBRANCHIATA) IN THE SHEEPSCOT ESTUARY, MAINE,
National Marine Fisheries Service, West Boothbay Harbor, Maine. Dept. of Sea Shore Fisheries.
E. P. Creaser, Jr.
J Fish Res Board Can. Vol 30, No 2, p 161-166, 1973. Illus.
Identifiers: *Bloodworms, Crangon-septemspinosus, *Estuaries, Glycera-dibranchiata, Larus-argentatus, *Maine(Sheepscot estuary), *Reproduction, *Food chains, Egg growth.

The population of bloodworms (G. dibranchiata) at Wiscasset, Maine, is composed of five assumed year-classes. Most spawners are probably large three- and four-yr-old blood-worms. At Wiscasset eggs are released into the coelom at a size of 21 micrometer. The rate of egg growth varies with season. In June 1-10 million eggs are spawned at a diameter of 151-160 micrometer. A bottom temperature in excess of 13C seems necessary for spawning to occur. Spawning occurs in the afternoon, between 2 hr before and 1 hr after high water. Males emit streams of sperm while swimming at the surface; females swim rapidly at the surface and suddenly rupture, liberating all the eggs at once. Females are slightly more abundant than males in the flats. Spawning bloodworms are preyed upon by herring gulls (Larus argentatus) and striped bass (Monone saxatilis), whereas spent epitokes are consumed by the mud shrimp (Crangon septemspinosus), which in turn is eaten by striped bass.--Copyright 1973, Biological Abstracts, Inc.

MAJOR PORT DEVELOPMENTS AT RICHARDS BAY WITH DUE REGARD TO PRESERVING THE NATURAL ENVIRONMENT,
Council for Scientific and Industrial Research, Pretoria (South Africa).
J. A. Zwamborn, and C. H. Cawood.
The Civil Engineer in South Africa, Vol 16, No 2, p 79-85, February, 1974. 6 fig, 6 ref.

Descriptors: *Industrial production, *Sea water, *Bays, Marine animals, Tidal flow, Ports, Channels, Flood relief, Environmental effects.
Identifiers: *South Africa(Richards Bay), Environmental protection.

South Africa has experienced considerable industrial growth which resulted in the need for more and better harbor facilities. Particularly in view of the transport of bulk materials, Richards Bay was chosen as the most suitable site for the establishment of deep water port to serve the existing and future industrial areas of the Transvaal, the Northern Free State and Natal. Richards Bay consists of a large shallow bay connected to the sea by a shallow estuary channel through which tidal flow and marine organisms can move freely. Since only half the bay area was required for harbor development, the Natal Provincial Administration proposed preserving the southern half of the bay as a nature reserve. A levee was constructed to separate the harbor area from the southern half of the bay, and at the same time to provide access to the bluff area on the south side of the harbor entrance channel and reduce siltation in the harbor basins. Time limitations precluded the model testing an an estuarine flood relief channel direct to the sea. Provision was made for both tidal exchange between the nature reserve and the harbor, and for flood discharge, by the inclusion of a

large flood relief structure in the levee. An alternative, ecologically much more attractive solution of a new estuary channel excavated through the dunes directly to the sea became an economically feasible proposition. (Prague-FIRL)

WELL-MIXED ESTUARIES WITH NONLINEAR RESISTANCE,
Syracuse Univ., N. Y. Dept. of Civil Engineering.
W-H. Li.
Journal of Hydraulic Research, Vol 12, No 1, p 83-97, 1974. 6 fig, 1 tab, 4 ref, 2 append.

Descriptors: *Estuaries, *Tidal effects, *Roughness(Hydraulic), Tides, Water levels, *Flow resistance, Currents(Water), Mathematical models, Mixing, Mannings equation, Equations, Numerical analysis.
Identifiers: *Well-mixed estuaries.

Two equations which take into account nonlinear flow resistance are proposed for solving for various tidal and channel conditions in natural estuaries. These equations are intended for well-mixed estuaries with small fresh-water flow and negligible diurnal inequality. Two functions in the equations that depend on the estuary geometry are determined from linear ordinary differential equations. Flow resistance, expressed by Manning's formula, requires knowing the roughness coefficient. The effects of roughness and tidal action are separated from the effects of the estuary geometry so that repeated numerical computations with a computer can be avoided when investigating several tidal amplitudes or channel roughnesses. SYSTEMS ANALYSIS OF A MULTI-STAGE TUBULAR MODULE REVERSE OSMOSIS PLANT FOR SEA WATER DESALINATION,
California Univ., Los Angeles. School of Engineering and Applied Science.
J. W. McCutchan, and V. Goel.
Desalination, Vol 14, No 1, p 57-76, February 1974. 10 fig, 1 tab, 29 equ, 17 ref.

Descriptors: *Desalination plants, *Dynamic programming, *Operating costs, Water costs, Water quality control, Sea water, Simulation analysis, Equations, Digital computers, *Reverse osmosis, Systems analysis, Mathematical modeling, *California.
Identifiers: *La Jolla(Cal), *Cost minimization.

A study is described to define single and multistage tubular module reverse osmosis systems for sea water application and to optimize these systems for minimum cost operation. Such a system has been analyzed based on current cellulose acetate membrane technology. Field data were recorded over a wide range of operating conditions on UCLA's tubular module operating on sea water feed at La Jolla, California. These data are used to develop mathematical equations to predict membrane performance under varying conditions. Cost equations are derived based on the actual costs incurred at La Jolla. A dynamic programming model is developed and solved on a digital computer, to arrive at optimum operating parameters for two- and three-stage designs. A variable membrane permeability model is used to simulate operating conditions along the tube length within a stage, to arrive at optimum membrane curing temperatures. Results show that the lowest cost water would be produced by the single-stage design if operating pressures as high as 1500 psi are used. However, two-stage operation has certain inherent advantages which could be weighed against the lower cost of single-stage operation. (Bell-Cornell)

MULTISTAGE EVAPORATOR,
Davidson (Maxwell) Evaporators Ltd., West Bromwich (England).
M. W. Davidson.
U.S. Patent No. 3,808,104, 5 p, 7 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 921, No 5, p 2042, April 30, 1974.

Descriptors: *Patents, *Water vapor, *Distillation, *Desalination, *Evaporators, *Water treatment, Equipment, Condensation, Evaporation.
Identifiers: Multistage evaporators.

Each stage includes one or more evaporating passages through which the liquid to be evaporated is caused to descend. The evaporating passages are flanked by passages to which heating fluid is supplied. The heating fluid condenses, giving up heat to the liquid to be evaporated, and condenses in reservoirs which are divided by partitions to form barometric leg arrangements. The condensed heating fluid in the reservoirs maintains a pressure differential between successive stages. A collector tray beneath each stage collects residual unevaporated liquid and delivers it to the evaporating passages of the next stage. The tray also collects condensed heating fluid overflowing from barometric legs and delivers this to the heating passages of the next stage. The tray includes apertures to allow vapor to pass from the evaporating passages of one stage to the heating passages of the next stage. (Sinha-OEIS)

EVAPORATING METHOD AND EVAPORATING APPARATUS,
Sasakura Engineering Co. Ltd., Osaka (Japan). (assignee).
T. Sasakura, and T. Kurosaka.
U.S. Patent No 3,809,623, 4p, 9 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 922, No 1, p 273, May 7, 1974.

Descriptors: *Patents, *Desalination, *Evaporation, *Distillation, *Condensation, Brines, Seawater, Brackish water, Potable water, *Evaporators.
Identifiers: Multistage flash evaporation.

The shell of the multistage flash evaporating apparatus is divided into evaporating chambers which are maintained at lower pressure from stage to stage with many partitions. An opening is provided at the lower part of each partition which forms a brine passage between adjacent stages and a first throttle concerned with the generation of flash evaporation. Flash evaporation is repeated by circulating the brine continuously through a series of evaporating chambers ranging from a stage of relatively high temperature and high pressure to a stage of lower temperature and lower pressure. The brine in one evaporating chamber flows into a box with the pressure somewhat reduced. Vapor is generated in correspondence with degree of pressure drop thereby producing a two-phase flow of liquid and vapor. The vapor ascends as it is separated from the residual brine, and it enters into a condenser where it is collected as product distilled water. (Sinha-OEIS)
W74-11396

DESALINZATION SYSTEM,
A. Griffin.
U.S. Patent No 3,824,156, 2 p, 9 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 924, No 3, p 624, July 16, 1974.

Descriptors: *Patents, *Desalination, *Water treatment, Water quality control, *Condensation, *Distillation, Seawater, Equipment, Separation techniques.

The apparatus consists of a station to which salt seawater is piped, the station having electric generators driven by a turbine powered by the incoming saltwater. The station includes boiler tanks in which the saltwater is boiled so that the stream can be piped to a condenser. From there distilled, pure freshwater is piped to a freshwater storage reservoir. The electric generator supplies energy to electric heaters for boiling the saltwater, driving pumps and powering all the equipment at the station. (Sinha-OEIS)
W74-11400

MULTIPLE EFFECT EVAPORATING APPARATUS,
Sasakura Engineering Co. Ltd., Osaka (Japan).
M. Takada.
U.S. Patent No 3,824,155, 3 p, 7 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 924, No 3, p 624, July 16, 1974.

Descriptors: *Patents, *Evaporation, *Desalination, *Distillation, *Water treatment, Sea water, Heat transfer, Potable water, Condensation, Equipment, *Evaporators.

The operation of the multiple effect evaporating apparatus is as follows: Seawater introduced from a piping, passing through the condenser, cools and condenses the vapor produced in the last effect and then is discharged from an exhaust pipe. The exhaust pipe is provided with a branch pipe through which a portion of the sea-water to be exhausted is sent as feed water, via a piping into a brine will. The brine thus mixed with the sea-water is pumped from the brine well by a circulating pump, a portion of which is supplied to the preheaters and the remainder is exhausted out of the system via an exhaust pipe. Where necessary, injection of scale inhibitor, deaeration, etc. will be carried out as in the case of a conventional seawater evaporating method. It is also possible to make only fresh sea-water flow through the preheater as circulating brine, without mixing it with concentrated brine. Thus, distilled water repeats flash evaporation and condensation and is finally flashed into the distilled water chamber of the lowermost stage. The flashed-off vapor in this chamber is combined with the vapor generated from the brine in the last effect and then condensed by the condenser which is supplied with the afore-mentioned feed water. Resultant condensate accumulates in the distilled water chamber and then is withdrawn by a distilled water pump through a piping. (Sinha-OEIS)

EVAPORATING METHOD AND APPARATUS,
Sasakura Engineering Co. Ltd., Osaka (Japan).
M. Takada, and K. Hamahata.
U.S. Patent No 3,824,154, 4 p, 2 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 924, No 3, p 624, July 16, 1974.

Descriptors: *Patents, *Desalination, *Distillation, *Evaporation, *Water treatment, Equipment, Sea water, Potable water, Heat transfer, Condensation, Evaporators.

A process for evaporating and distilling liquids such as brine or sea water provides effective units operable at differing pressures vertically one on top of the other, with units of higher pressure positioned succeedingly higher. The uppermost of the effective units has a heating tube supplied by an external heating source and an upper brine well which has jet holes. The lowermost effective unit has a brine well and a condenser with a cooling tube. There are horisontal partition walls separating adjacent effective units, each of the partition walls forms a brine well and has a plurality of jet holes. Each of the effective units other than the uppermost has a horizontal heat transfer tube bundle including at least one heat transfer tube positioned below the jet holes of the next upper partition wall. Each of the effective units other than the lowermost effective unit has a vapor releasing chamber communicating with the interiors of the heat transfer tubes and with the preheating chamber of the succeeding effective unit. The lower most effective unit has a vapor releasing chamber surrounding the condenser which comprises an initial preheater tube. (Sinha-OEIS)

DISTILLATION OF SALINE WATER BY DIRECT CONTACT HEAT EXCHANGE WITH IMMISCIBLE LIQUID,
Secretary of the Interior, Washington, D.C.
K. C. D. Kickman.
U.S. Patent No 3,821,089, 3 p, 2 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 923, No 5, p 1886, June 28, 1974.

Descriptors: *Patents, *Distillation, *Desalination, *Heat transfer, *Water treatment, Saline water, Sea water, Condensation.
Identifiers: *Heat exchange, Ambiphyllic agents, Immiscible oils.

Steam is directly condensed with a cool immiscible oil admixture with an ambiphyllic agent. To overcome the formation of scale on heat transfer surfaces during saline water distillation, it has been proposed to employ an immiscible heat transfer liquid in the system wherein steam is generated from the saline feed water by directly contacting it with a hot liquid usually referred to as a hot immiscible oil. During this heat exchange, the oil is cooled. After separation from the residual feed water, the cooled oil is brought into direct contact with the generated steam to condense the steam and simultaneously heat the oil again in preparation for the next distillation cycle. (Sinha-OEIS)

WARM FOG AREA SEEDING STUDIES,
Meteorology Research, Inc., Altadena, Calif.
T. B. Smith, and D. M. Takeuchi.
Available from NTIS, Springfield, Va. 22161 as AD-767 297, Price $2.75 printed copy; $2.25 microfiche. Air Force Cambridge Research Laboratories, Bedford, Massachusetts, Technical Report 73-0437, July 20, 1973. 18 p, 8 fig, 1 tab, 1 append. Contract No F 19628-72-C-0236.

Descriptors: *Fog, *Cloud seeding, *Weather modification, Model studies, Aircraft.
Identifiers: *Warm fog, *Fog dispersal.

The effects of area seeding for warm fog dispersal were tested with sized urea particles. The area seeding concept was modeled and planned on the basis of a uniform, known wind environment. Difficulties were encountered during the tests due to shifting wind patterns and wind velocities which were higher than indicated in the observational data. The area concept is difficult to carry out operationally and may be limited to uniform, predictable fog environments. (Knapp-USGS)
W74-11032

WARM FOG DISPERSAL TECHNIQUES,
Navy Weather Research Facility, Norfolk, Va.
D. M. Feit, E. E. Hindman, II, D. B. Johnson, and P. M. Tag.
Available from NTIS, Springfield, Va 22161 as AD-760 674, Price $3.50 printed copy; $2.25 microfiche. Technical Paper No 1-69 (Rev), October 1970. 46 p, 6 fig, 3 tab, 36 ref.

Descriptors: *Weather modification, *Fog, Cloud physics, Particle size, Clouds, Cloud seeding.
Identifiers: *Fog clearing.

The results of warm-fog dispersal studies at Navy Weather Research Facility, and elsewhere are summarized. Four different clearing techniques are examined: heating, helicopter or aircraft mixing, hydroscopic treatments, and water-droplet sweepout. The application of heat or mixing by aircraft can result in the total conversion of fog to water vapor. Hydroscopic treatments and water-droplet sweepout on the other hand, achieve visibility improvement by modifying the droplet spectra and by the precipitation of a sizeable portion of the liquid water from the treated zone. A warm fog is normally defined as any fog having a temperature above O deg C. In actual practice, however, fogs having temperatures down to about -5 deg C may be treated using 'warm-fog' techniques since 'supercooled' techniques are not practical until the temperature drops appreciably below O deg C. (Knapp-USGS)

A SUMMARY OF THE U.S. NAVY PROGRAM AND FY 1970 PROGRESS IN WEATHER MODIFICATION AND CONTROL.
Navy Weather Research Facility, Norfolk, Va.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-769 544, Price $5.25 printed copy; $2.25 microfiche. Technical Paper No 24-70, December 1970. 55 p, 20 fig.

Descriptors: *Weather modification, *Cloud physics, Cloud seeding, Climatology, Meteorology, Fog, Military aspects, Research and development.
Identifiers: *US Navy.

Weather modification research of the U.S. Navy is reviewed. The Office of Naval Research supports fundamental research in cloud physics at various universities, in a program intended to eliminate specific gaps in knowledge. The Naval Research Laboratory is responsible for conducting basic cloud physics research for the design and development of improved cloud-physics instrumentation, and for carrying out a measurement program that will provide information about the natural and artificially produced variability of microphysical processes. The Naval Weapons Center develops, tests and perfects the actual techniques and agents employed in field experiments, and carries out a broad spectrum of supporting laboratory work in physical chemistry. The Navy Weather Research Facility has responsibilities in the design, coordination and evaluation of Navy weather modification experiments, and meteorology. The Naval Air Systems Command has cognizance for Navy meteorological development, including weather modification. The Naval Weather Service Command is the operational arm of the Navy's meteorological organization. (Knapp-USGS)

ATMOSPHERIC WATER RESOURCES MANAGEMENT PROGRAM,
Montana State Univ., Bozeman. Dept. of Earth Sciences.
A. B. Super, C. A. Grainger, J. T. McPartland, V. L. Mitchell, and R. H. Yaw.
Available from NTIS, Springfield, Va 22161 as PB-218 705, Price $6.00 printed copy; $2.25 microfiche. Final Contract Report (Part I), December 15, 1972. 425 p, 126 fig, 23 tab, 91 ref, 8 append. USBR Contract 14-06-D-6798.

Descriptors: *Cloud seeding, *Weather modification, *Montana, Meteorology, Instrumentation, Research and development, Silver iodide, Orog-

raphy, Mountains, Snowfall, Precipitation(Atmospheric).

Winter cloud seeding experiments were conducted in the Bridger Range of southwestern Montana during 1969-72 to determine the meteorological conditions under which ground-based silver iodide seeding could modify mountain snowfall in the climate of the Northern Rockies. The main portion of the research program was a randomized winter orographic cloud seeding experiment. Significant snowfall increases were obtained in at least 83 days of the 259 experimental days logged. Experiments aimed at developing a practical scheme for direct detection of cloud seeding effects are described. Several snowfall characteristics including ice crystal types, concentrations, and sizes were examined before, during, and after seeding events. Radar was used in several special experiments to directly detect seeding effects, detailed analysis of the spatial and temporal variability or orographic storms, and measurements of precipitation tops. Airflow and diffusion studies were made to verify targeting of the seeding agent. Both pilot ballon measurements and airborne plume tracing indicated generally successful targeting. (Knapp-USGS)

SEVENTH ANNUAL SURVEY REPORT ON THE AIR WEATHER SERVICE WEATHER MODIFICATION PROGRAM (FY 1974),
Air Weather Service, Washington, D.C.
H. A. Chary, R. L. Lininger, and J. E. Neyman.
Available from NTIS, Springfield, Va., 22161 as AWS-TR-74-254, Price $3.00 printed copy; $2.25 microfiche. Air Weather Service Technical Report 74-254, July 1974. 13 p, 3 fig, 1 tab.

Descriptors: *Weather modification, *Fog, *Military aspects, Cloud seeding.
Identifiers: *Fog dissipation.

This report is the seventh in a series of annual surveys of the Air Weather Service weather modification program. It briefly describes weather modification efforts undertaken during FY 1974, including the techniques, equipment, and results. During FY 74 AWS did not carry out any new field projects of operational testing and evaluation. The three cold-fog dissipation installations operated by AWS personnel were all used in a fully operational manner. (Knapp-USGS)

GROWTH, MINERAL COMPOSITION, AND SEED OIL OF SESAME (SESAMUM INDICUM L.) AS AFFECTED BY BORON AND EXCHANGEABLE SODIUM,
California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
Y. H. Yousif, F. T. Bingham, and D. M. Yermanos.
Soil Science Society of America Proceedings, Vol 36, No 6, p 923-926, November-December, 1972. 2 fig, 3 tab, 17 ref.

Descriptors: *Salinity, *Alkali soils, *Sodium, *Boron, Chemical properties, Soil chemistry, Saline soils, Salts.
Identifiers: *Sesame.

A solution culture boron experiment was conducted with sesame to show the effects of excessive B. The boron content of leaf blades, petioles, and stems was highly correlated with substrate boron. The leaf blades contained the highest amount of boron, and the stems and least. Concentrations of 5 mg B/l or higher inhibited growth, seed production, and resulted in a leaf necrosis and premature leaf drop. Foliage of plants receiving excess B contained > 700 micrograms B/g on a dry weight basis. An exchangeable sodium experiment using clay soil with and without a synthetic soil conditioner showed that yields were sharply reduced at an ESP level of 15 or greater. Leaf blade sodium was higher for the treatments without the soil conditioner but in both series, 50% growth depression was associated with leaf values of about 0.4% Na. Potassium and Mg in the leaf blades did not vary significantly, and although calcium was decreased 50% with increasing ESP, no visual deficiency symptoms were detected. (Skogerboe-Colorado State)

COMPARISON OF THE EFFICIENCIES OF VERTICAL AND HORIZONTAL DRAINAGE (SRAVNITEL'NAYA EFFEKTIVNOST' VERTIKAL'NOGO I GORIZONTALNOGO DRENAZHA),
N. M. Resetkina, and V. A. Dukhovnyy.
Gidrotekhnika i Melioratsiya, No 1, p 76-80, 1974. 1 fig, 1 tab.

Descriptors: *Groundwater, *Aquifers, *Hydrologic aspects, *Drainage, *Controlled drainage, Drainage practices, Subsurface drainage, Drainage engineering, Automation.
Identifiers: *USSR(Kirov area).

The efficiencies of vertical and horizontal drain and irrigation systems are compared on the basis of experiences gained with such systems in the Kirov and other areas. Vertical drain systems have advantages over horizontal systems in that they do not occupy useful farm lands, do not interfere with farming operations, they can be used year round, permit groundwater stabilization at any level, and permit the use of groundwater for irrigation. In addition, the construction of such vertical systems can be mechanized, and the operation be automated or remote-controlled. (Takacs-FIRL)

THE EFFECTS OF NITROGEN, POTASSIUM, AND SUBIRRIGATION ON THE YIELD, QUALITY, AND COMPOSITION OF SINGLE-TRUSS TOMATOES,
Agricultural Research Council, Littlehampton (England). Glasshouse Crops Research Inst.
P. Adams, G. W. Winsor, and J. D. Donald.
J Hortic Sci. Vol 48, No 1, p 123-133, 1973. Illus.
Identifiers: Acidity, Flowering fruits, Growth, *Nitrogen, *Potassium, *Tomatoes, Truss, Irrigation, *Crop yield.

Two successive crops of cv-'Minicraigella' were grown with subirrigation in a tiered-trough system, the troughs containing a 7:3:2 mixture of loam, peat and grit. Four concentrations of N in solution (100, 150, 200 and 250ppm N) were tested in factorial combination with three concentrations of K (200,300 and 400ppm K), the treatments being replicated four times. Plant height and leaf length increased markedly with N concentration, as also did the numbers of flowers and marketable fruits per plant, the mean weight per fruit and the total yield. Low N levels delayed harvesting. The proportion of unevenly ripened fruit decreased with increasing concentrations of both N and K. The percentage of hollow fruits was decreased by high K but increased with N concentration. The titratable acidity of the expressed fruit juices increased significantly with N concentration ($P < 0.001$) but was little affected by K treatment. The N concentration of the nutrient solution also largely controlled the percentage of K in the leaves and the total uptake of this nutrient. These unexpected results were attributed to stimulation of growth by N, leading to increased water requirements and hence to increased application of both N and K by the automatic subirrigation system. The highest yields and best quality fruit were obtained with 250ppm N and 400ppm K in the solution, although lower concentrations of K might be preferable after continued cropping in the same compost.--Copyright 1973, Biological Abstracts, Inc.

AN ALTERNATIVE EXPLANATION FOR THE APPARENTLY ACTIVE WATER EXUDATION IN EXCISED ROOTS,
Toronto Univ. (Ontario). Dept. of Botany.
M. T. Tyree.
J Exp Bot, Vol 24, No 78, p 33-37. 1973. Illus.
Identifiers: *Exudation, Maize, *Roots(Excised roots), Zea-Mays, *Corn(Field), Model studies, Osmotic pressure, Anions, Cations.

A standing-gradient osmotic-flow model has been proposed by others to explain the apparently active uptake in excised maize (Zea mays) roots. An alternative model is proposed which incorporates electrogenic coupling between the fluxes of anions and cations and electro-osmotic coupling between the fluxes of cations and water in the cell walls of roots. This model does not exclude the contribution (positive or negative) of a standing-gradient osmotic flow.--Copyright 1973, Biological Abstracts, Inc.

RATES OF GROWTH AND NUTRIENT UPTAKE OF IRRIGATED CORN AS AFFECTED BY N AND P FERTILIZATION,
Inst. of Agricultural Research, Volcani Bet. Dagan (Israel). Div. of Soil Chemistry and Plant Nutrition.
B. Bar-Yosef, and U. Kafkafi.
Soil Science Society of America Proceedings, Vol 36, No 6, p 931-936, November-December, 1972. 1 fig, 7 tab, 23 ref.

Descriptors: *Nutrient requirements, *Corn(Field), *Phosphorus, *Nitrogen, Fertilizers, Soil chemistry, Absorption.

Growth rates of corn and weekly uptake of major nutrients were measured in a permanent plot fertilization experiment. Bicarbonate-soluble P and NO3-N concentration in the soil were measured four times during the growing period. High levels of nitrates in the soil during the first month of growth suppressed dry matter production. An increase in soil phosphate concentration resulted in higher phosphate uptake and early appearance of male flowers. On the control plots, which had not received any phosphatic fertilizer for eight years, the plants took up more phosphate than the amount estimated by the bicarbonate method. The high levels of nitrates found in the soil 4 weeks after seeding dropped within the fifth week to a level of 20-10 ppm N. Denitrification to gaseous compounds in the presence of living plants due to 68 mm of sprinkler-applied water is proposed as an explantion of this phenomenon. (Skogerboe-Colorado State)
W74-11263

CROP RESIDUE, SOIL WATER, AND SOIL FERTILITY RELATED TO SPRING WHEAT PRODUCTION AND QUALITY AFTER FALLOW,
Agricultural Research Service, Sidney, Mont.
A. L. Black.
Soil Science Society of America Proceedings, Vol 37, No 5, p 754-758, September-October, 1973. 1 fig, 5 tab, 19 ref.

Descriptors: *Cultivation, *Fallowing, Organic matter, Mulching, *Fertilizers, Nitrogen, Phosphorous, Proteins, *Wheat, *Soilwater.

Over an eight year period, wheat straw mulch rates to 0, 1,680, 3,360, and 6,730 kg/ha were established each spring of the fallow year in alternate crop-fallow blocks in three replications on a Dooley sandy loam. Fertilizer subplot treatments applied before seeding spring wheat were as follows: Check, N/P, and N plus P. Both elements were applied at a rate of 34kg/ha; N was applied each crop year, and P was applied initially and every other crop year thereafter. After 14 and 21 months of fallow, average available soil water stored to a depth of 1.5 m increased significantly and was positively correlated with increasing residue levels. Each metric ton of surface residue increased average available soil water supplies 0.5 cm. Mean grain yields were positively correlated with stored soil water at seeding only when both N and P were applied. N-P fertilization increased mean grain yields 410, 580, 690, and 760 kg/ha per year for corresponding residue levels of 0, 1,680, 3,360, and 6,730 kg/ha respectively. (Skogerboe-Colorado State)
W74-11264

CALCIUM, MAGNESIUM, AND POTASSIUM SATURATION RATIOS IN TWO SOILS AND THEIR EFFECTS UPON YIELDS AND NUTRIENT CONTENTS OF GERMAN MILLET AND ALFALFA,
Ohio State Univ., Columbus.
E. O. McLean, and M. D. Carbonell.
Soil Science Society of America Proceedings, Vol 36, No 6, p 927-930, November-December, 1972. 3 tab, 16 ref.

Descriptors: *Salinity, Saline soils, Nutrients, *Calcium, *Magnesium, *Potassium, *Alfalfa, *Crop response.
Identifiers: *German millet.

A greenhouse study involving sequential cropping of two soils of differing cation exchange capacities with five Ca-Mg saturation ratios at two K levels was conducted. German millet followed by alfalfa was grown with Mg-Ca saturations varied from Mg 5%-Ca 75% to Mg 25%-Ca 55% at two K levels. German millet yields were not affected in the above range of Ca-Mg saturations. However, an apparent Mg response occurred when alfalfa yields were more than double by increasing initial Mg and Ca saturations from 3 and 18% to 5 and 75%, respectively. Exchangeable Mg and Ca ontents in the soils after cropping plus amounts removed by cropping were less than the initial contents in one soil and were more than the initial contents in the other. Evidently some type of fixation mechanism tied up Mg and Ca in the former whereas solubilization of residual lime released them in the latter. (Skogerboe-Colorado State)
W74-11269

APPLIED AND RESIDUAL NITRATE-NITROGEN EFFECTS ON IRRIGATED GRAIN SORGHUM YIELD,
Texas A and M Univ., Lubbock. Agricultural Research and Extension Center.
A. B. Orken, and H. D. Sunderman.
Soil Science Society of America Proceedings, Vol 36, No 1, p 94-97, January-February, 1972. 4 tab, 14 ref.

Descriptors: *Nutrient removal, *Nitrogen, *Crop response, Crop production, Crops, Leaching, Water pollution sources, *Sorghum.

Multirate nitrogen studies were conducted for a three year period, on an irrigated clay loam soil at two locations, to determine the influence of applied and residual soil N on the yield of grain sorghum. Soil samples were taken prior to fertilizer application in depth increments of 0-15, 15-30, 30-61, and 61-91 cm and analyzed for nitrate. Applied and residual soil NO3-N were found to influence grain yields. Regression analysis of the data showed highly significant relationships between quantities of soil nitrates measured at upper depths to those measured at lower depths, and grain yield and applied N+ residual NO3-N. Best correlations were obtained when residual NO3-N was included in the regression equation. Results indicated that soil samples taken to 15 or 30 cm would be sufficient for evaluation of residual nitrogen effects. (Skogerboe-Colorado State)

A LONG-TIME WATER-TABLE STUDY OF AN IRRIGATION PROJECT IN SOUTHERN ALBERTA,
Department of Agriculture, Lethbridge, (Alberta). Research Station.
E. Rapp, and van Schaik.
Canadian Agricultural Engineering, Vol 14, No 1, p 29-32, June, 1972. 3 fig, 2 tab, 5 ref.

Descriptors: *Drainage, *Groundwater, *Water table, Drainage, Drainage engineering, Irrigation, Groundwater movement, Soil water, *Canada.

Water table levels were measured for a period of 15 years in the Vauxhall District. The seasonal mean water table depth was 169 cm with a stan-

dard deviation of plus or minus 10 cm. On the average, 64% of the area had a water table higher than the accepted standard of 183 cm. Although variability in some Units was high, mean seasonal water table data indicate that no serious drainage problem exists in the Vauxhall District. There was no consistent relationship between irrigation water used or the total hydrologic input and the concurrent water table depth. This indicates that the water table in the Vauxhall District is not a direct function of either irrigation or seasonal rainfall on a long-term basis. (Skogerboe-Colorado State)
W74-11271

MULCH AND TILLAGE RELATIONSHIPS IN CORN CULTURE,
Ohio Agricultural Research and Development Center, Wooster.
D. M. Van Doren, Jr., and G. B. Triplett, Jr.
Soil Science Society of America Proceedings, Vol 37, No 5, p 766-769, September-October, 1973. 4 tab, 10 ref.

Descriptors: *Cultivation, *Mulching, *Organic matter, *Corn(Field).

Relative effects of soil mulch cover and various tillage practices on corn yield were studied as functions of previous crop and rainfall on a typic fragiudalf soil. Residues were removed from the soil prior to tillage, manipulated according to action of the tillage implements, or replaced on the soil surface after tillage. Eight tillage treatments consisted of all possible combinations of moldboard plowing, disking, and post emergence cultivation. Mulch cover produced three times as great a yield effect as any other single variable. Tillage variables increased yield in order of cultivation > plow > disk, and results are expressed in terms of mulch cover required to produce an equal yield effect. Most tillage and mulch effects were additive. The major reason for mulch and tillage effects on corn yield is assumed to be their influence on soil water content. Possible extrapolation of these results to other soils and climates is discussed. (Skogerboe-Colorado State)
W74-11275

RESIDUAL EFFECTS OF N15-LABELED FERTILIZERS IN A FIELD STUDY,
Illinois Univ., Urbana. Dept. of Agronomy.
R. L. Westerman, and L. T. Kurtz.
Soil Science Society of America Proceedings, Vol 36, No 1, p 91-94, January-February, 1972. 1 fig, 3 tab, 6 ref.

Descriptors: *Nutrient removal, *Nitrogen, *Leaching, Crop production, Crop response, Crops, Denitrification, *Radioisotopes, Sorghum, *Sudangrass, Water pollution sources.

Residual effects of two N15-labeled N fertilizers, urea and oxamide, were compared during the second cropping season after they had been applied at rates of 0, 56, 112, and 168 kg N/ha. 'Sudax SX11' sorghum-sudan grass hybrid was grown and harvested three times during this second cropping season while the residual effects were being measured. Fertilizer N removed in plant tops during this second year of cropping contained 13-18% of the residual fertilizer N in the soil at the end of the first season and was equal to 4-6% of that applied originally in the fertilizers. At the end of the second cropping season, 22 and 26% of the initial applications of N in urea and oxamide, respectively, remained in the soil. The effect of carriers on these amounts of residual fertilizer N was not significant. The removals in crops during the second season were essentially equal to the residual fertilizer N which had been in the soil at the end of the first season. (Skogerboe-Colorado State)

ASPECTS OF AGRICULTURAL USE OF POTATO STARCH WASTEWATER,
Agricultural Univ., Wageningen (Netherlands). Dept. of Soils and Fertilizers.
F. A. M. De Haan, G. J. Hoogeveen, and F. Riem Vis.
Neth J Agric Sci. Vol 21, No 1, p 85-94. 1973. Illus.

Descriptors: *Water reuse, *Waste water disposal, Fertilizers.
Identifiers: Land disposal, Potato starches.

Agricultural industries in the NE Netherlands, with the potato starch industry as the most important one, produce a very large amount of wastewater. Research work is now performed on possible solutions to the environmental problems resulting from discharge of this water on open canals. Land-disposal offers such a possibility. The wastewater contains the natural components of potatoes. The main constituents are the major elements for plant nutrition thus rendering an opportunity to recycle these components. Evaluation of wastewater use for agricultural purposes must be based on a number of criteria of which the most important ones are: purification by the soil system, fertilization of agricultural crops, and economic effects. Experimental results and model calculations indicate that with mean yearly application rates in the range of 50-100 mm the relevant requirements are practical.--Copyright 1974, Biological Abstracts, Inc.

STORM DRAINAGE SYSTEMS DESIGN MADE ADAPTABLE FOR COMPUTERS,
Austin Co., Roselle, N.J. Civil - Structural Dept.
M. Dillon.
Building System Design, Vol 70, No 7, p 27-29, October/November, 1973.

Descriptors: *Model studies, Storm runoff, *Drainage systems, *Storm drains, Rainfall intensity.
Identifiers: *Rational method of storm design.

The Rational Method of Storm Design is described and applied to a computerized design of storm drainage systems for 2 to 200 acre commercial and industrial sites. The Rational Method presents a formula for the peak discharge rate in cubic feet per second in terms of the drained area in acres, runoff coefficient, and the average rainfall intensity in inches per hour. It is necessary to know the time of concentration for proper design of a storm drainage system. The time of concentration is the sum of overland flow time, plus time of flow in pipe above the design section. Overland flow time is the longest period of time, measured from the beginning of a theoretical design storm, for runoff to travel from the most remote point of the collection area, along a path perpendicular to contour lines, down to the design section, usually an inlet. (Merritt-FIRL)

WATER LEVELS IN ARTESIAN AND NONARTESIAN AQUIFERS OF FLORIDA, 1971-72,
Geological Survey, Tallahassee, Fla.
H. G. Healy.
Florida Bureau of Geology, Tallahassee, Information Circular No 85, 1974. 94 p, 54 fig, 1 tab.

Descriptors: *Water levels, *Groundwater, *Florida, Aquifers, Withdrawal, Saline water intrusion, Data collections, Basic data collections, Hydrologic data, Water level fluctuations, Hydrogeology.

The trends and fluctuations of groundwater levels in wells tapping the principal aquifers in Florida during 1971-72 are summarized by hydrographs of wells in the several aquifers, maps showing changes in groundwater levels during specific periods, and a table summarizing the principal data in selected observation wells. The demand for freshwater for industrial, municipal, and agricultural uses in Florida has increased yearly. Although groundwater supplies have been adequate for the increased demand in most areas, water levels have declined appreciably in some. Because demand for groundwater continues to increase, shortages will occur and may become critical in some areas. In coastal areas, declining water levels may allow saltwater to enroach and shortages could result from deterioration in quality as well as from the reduction of quantity of water available. TOMBIGBEE RIVER (EAST FORK), ITAWAMBA COUNTY, MISSISSIPPI. OPERATION AND MAINTENANCE.
Army Engineer District, Mobile, Ala.
Available from Nat. Tech. Info. Serv., as EIS-MS-73-1749-F. November 5, 1973. 73 p, 1 map.

Descriptors: *Mississippi, *Channel improvement, *Flood protection, Flood control, Gulf Coast plain.
Identifiers: *Itawamba Co, Miss, *Environmental Impact Statements.

This project is part of the continuing operation of the existing flood control program on the Tombigbee River in Itawamba County, Mississippi. The maintenance work consists of removal of snags and drift jams that obstruct the flow of the river and disposal of the debris. At present the channel is choked by drift jams and obstructions throughout its length, causing flooding which would not occur if the channel was cleared. The project will alleviate the flood conditions and improve the navigability of the river. The adverse environmental effects would be primarily the increased turbidity accompanying construction activity and the reduction of available habitat for aquatic invertebrates and algae. Bank clearing, channelization, and no action were deemed nonfeasible alternatives for this project. Both short-term and long-term productivity will be enhanced with minimal detrimental effect upon wildlife and aquatic habitat. Comments received from various state and federal agencies support this project. (Deckert-Florida)

THE HYDROLOGY OF THE LEXINGTON AND FAYETTE COUNTY, KENTUCKY AREA,
Geological Survey, Louisville, Ky.
D. S. Mull.
Lexington and Fayette County Planning Commission, Lexington, 1968. 24 p, 23 fig, 3 tab, 27 ref.

Descriptors: Water resources, *Surface waters, *Groundwater, *Kentucky, Data collections, Hydrologic data, Hydrogeology, Karst hydrology, Surface-groundwater relationships, Base flow.
Identifiers: *Lexington(KY), *Fayette County(KY).

The water resources in rivers, creeks and ponds and circulating groundwaters in Fayette County, Kentucky, are described. About 582 mgd of water, or 43.71 inches annually, enters Fayette County from precipitation. About 60 percent, or 340 mgd, of this is consumed by crops, natural vegetation, evaporation, and man. The remainder, approximately 240 mgd, is potentially available for use. Most of this water, 224 mgd, runs off in streams to the Kentucky River. A small amount of water, 16 mgd, is lost from the county by underflow. During times of flood, water levels in the streams rise above the water table and recharge the groundwater reservoir in the vicinity of the stream. Fairly high volumes of water may be discharged to the groundwater reservoir in the Lexington area due to the abundance of joints and solution openings that are common in the underlying beds of limestone. All streams in the area flow directly on bedrock or on a layer of alluvium. Streamflow is variable and results from a combination of surface runoff and seepage from groundwater in aquifers underlying the streambed. An additional source of streamflow in the urbanized area is sewage effluent. During dry weather, seepage from groundwater is the major source of streamflow in all streams in the Lexington area except Town Branch. In Town Branch the major source of dry-weather flow is effluent from the Lexington sewage treatment plant. (Knapp-USGS)

FLOOD PLAIN INFORMATION, HOADLEY CREEK, KETCHIKAN, ALASKA.
Corps of Engineers, Anchorage, Alaska.
Flood Plain Report, June 1974. 23 p, 7 fig, 7 plate, 2 tab.

Descriptors: *Floods, *Alaska, Flood control, *Flood plain zoning, Flood protection, Flood data.
Identifiers: *Hoadley Creek(AK), *Ketchikan(AK).

Flooding from Hoadley Creek, Ketchikan, AK, is described. The properties along this stream are primarily residential and, for the most part, have been developed only in recent years. There are still open spaces adjacent to the stream which are available for future development. A knowledge of flood potential and flood hazards is important in land use planning and for management decisions concerning flood plain use. The study includes a history of flooding along Hoadley Creek and identifies those areas that are subject to possible future floods. Special emphasis is given to these floods through maps, photographs, profiles and cross sections. A basis is provided for the adoption of land use controls to guide flood plain development and thereby prevent intensification of loss and damage. (Knapp-USGS)

AVAILABILITY OF GROUNDWATER IN THE LOWER PAWCATUCK RIVER BASIN, RHODE ISLAND,
Geological Survey, Washington, D.C.
J. B. Gonthier, H. E. Johnston, and G. T. Malmberg.
Available from Sup Doc, GPO, Washington, D.C. 20402 Price $3.80. Water-Supply Paper 2033, 1974. 40 p, 7 fig, 10 tab, 24 ref.

Descriptors: *Groundwater, *Groundwater availability, *Rhode Island, Groundwater recharge, Induced infiltration, Groundwater reservoirs, Water supply, Aquifers, Water quality, Withdrawal, Water yield, Surface-groundwater relationships, Water resources.
Identifiers: *Lower Pawcatuck River basin(RI).

The water availability in the lower Pawcatuck River basin in southwestern Rhode Island was determined. The basin is an area of about 169 sq mi underlain by crystalline bedrock over which lies a relatively thin mantle of glacial till and stratified drift. Water available for development in this aquifer consists of groundwater in storage plus infiltration that can be induced into streams. Minimum annual groundwater runoff is 0.76 mgd per square mile. Potential recharge by induced infiltration is estimated to range from about 250 to 600 gpd per linear foot of streambed for the principal streams. In most areas, induced infiltration from streams constitutes the major source of water potentially available for development by wells. The potential yield from five of the most promising groundwater reservoirs was evaluated by means of mathematical models. Continuous withdrawals ranging from 1.3 to 10.3 mgd, and totaling 31 mgd, are obtainable from these reservoirs. Proposed export from the Pawcatuck basin of 27 mgd will markedly reduce low streamflow. The 90% duration flow of the Pawcatuck River at Westerly would be reduced from 75 mgd to perhaps as little as 21 mgd. The chemical quality of water from both the sand and gravel aquifer and associated streams is suitable for most purposes. Some treatment may be required locally for removal of iron and manganese to meet recommended standards. (Myers-USGS)

WATER-SUPPLY DEVELOPMENT AND MANAGEMENT ALTERNATIVES FOR CLINTON, EATON, AND INGHAM COUNTIES, MICHIGAN,
Geological Survey, Washington, D.C.
K. E. Vanlier, W. W. Wood, and J. O. Brunett.
Available from GPO, Washington, D C 20402, Price $3.20 paper copy. Water-Supply Paper 1969, 1973. 111 p, 35 fig, 6 tab, 34 ref.

Descriptors: *Water resources development, *Water management(Applied), *Michigan, Surface waters, Groundwater, Conjunctive use, Great Lakes, Inter-basin transfers.
Identifiers: *Lansing(Mich), Clinton County(Mich), Eaton County(Mich), Ingham County(Mich).

The water resources of the Tri-County region, consisting of Clinton, Eaton, and Ingham Counties, an area of 1,697 square miles in Michigan's Lower Peninsula were investigated. The population is nearing 400,000 and by 1990 will be near 600,000. Average daily water use is slightly more than 30 million gallons today; by 1980 it will be about 50 million gallons, and by 1990 it will probably be about 70 million gallons. The Tri-County region is drained by seven river systems. Low flows in cubic feet per second, are as follows: Grand River, 180; Maple River, 34; Looking Glass River, 28; Red Cedar River, 30; Portage Creek, 15; Battle Creek, 20; and Thornapple River,24--a total of 331 cubic feet per second or about 220 million gallons per day. The principal source of groundwater is a complex aquifer system composed of the Saginaw and Grand River Formations and some of the overlying glacial sediments. This aquifer yields between 300 and 700 gpm to individual wells. In some parts of the region, the glacial sediments are favorable for development of moderate to large supplies of water. Some of the chief factors and methods that must be considered when planning water systems are combined use of ground and surface water, artificial recharge, treatment of wastes, use of storage reservoirs, and importation of water from the Great Lakes. COST ANALYSIS OF GROUNDWATER SUPPLIES IN THE NORTH ATLANTIC REGION,
Geological Survey, Reston, Va.
D. J. Cederstrom.
Water Well Journal, Vol 28, No 8, p 39-43, August 1974. 3 tab.

Descriptors: *Water wells, *Water costs, *Northeast U.S., *Water yield, Economics, Water distribution(Applied), Water sources, Water supply, Hydrogeology, Groundwater, Cost analysis, Construction costs.

Methods are given for calculating costs of groundwater supplies for municipal and industrial uses from aquifers in the North Atlantic Region. The capital cost of groundwater and the cost per thousand gallons in typical geologic and hydrologic environments is given in tabular form. For broad planning purposes, large areas may be generally characterized as to range of yields per well. The materials and work needed to construct wells with those yields can be estimated within reasonable limits. The cost of large supplies of groundwater at the wellhead in the North Atlantic Region in 1970 generally varied from 1.5 to 5 cent/kgal. Water from crystalline rocks and shale is relatively expensive. Water from sandstone is less so. Costs of water from sands and gravels in glaciated areas and from Coastal Plain sediments range from moderate to very low. In carbonate rocks costs range from low to fairly high. Development of small to moderate supplies to groundwater may

ffer favorable cost alternatives to planners, but
rge supplies of groundwater for delivery to one
oint cannot generally be developed inexpensive-
. Well fields in the less productive aquifers may
e limited by costs to 1 or 2Mgal/d, but in the more
vorable aquifers development of several tens of
illions of gallons a day may be practicable and in-
xpensive. (Knapp-USGS)

MAINTENANCE DREDGING, NEW HAVEN HARBOR, CONNECTICUT (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Corps of Engineers, Waltham, Mass. New England Div.
Available from National Technical Information Service, as EIS-CT-73-1357-F. August 16, 1973. 270 p, 27 fig, 13 tab.

Descriptors: *Dredging, *Harbors, *Connecticut, Spoil banks, Continental shelf, Atlantic Ocean, Coastal plains, Sediment control.
Identifiers: *Environmental Impact Statements, *Offshore dumping, *New Haven Harbor(CT).

This project involves maintenance dredging of the main channel in New Haven Harbor, Connecticut and disposal of 800,000 cubic yards of spoil material at the New Haven Dumping Grounds in Long Island Sound. The dredging is necessary for the continued operation of the harbor and would be done between October 1 and May 31 to minimize adverse effects upon the oyster beds present in the waters. Considerable opposition to the offshore spoil deposit has been raised by many environmental groups and government agencies. While the primary benefits of the project are economic, there is a possibility of significant detrimental effects upon aquatic life both from the dredging and the spoil deposit. The controversy centers around the uncertainty regarding the effects of the spoil on the aquatic life in the area of the dump. All alternative methods of disposal are considered prohibitively expensive. Though delay would create serious economic difficulties for the harbor area, the environmentalists urge that the project be postponed until more conclusive data can be obtained. The plan calls for continuous monitoring of the dump site for adverse effects, but this protection is considered inadequate by those who oppose the project. (Deckert-Florida)

METHODS FOR THE DIRECT DETERMINATION OF HEAVY-METAL POLLUTANTS IN THE ENVIRONMENT,
Louisiana State Univ., Baton Rouge.
D. K. Wolcott.
Available from University Microfilms, 300 No. Zeeb Rd., Ann Arbor, Mich., 48106 (Order No. 74-7273). Ph D Dissertation, 1973. 168 p.

Descriptors: *Heavy metals, Pollutants, *Ecology, *Cadmium, Liquid wastes, Oxidation-reduction, Analytical techniques, Biosphere, Plastics, Filter paper, Fluids, *Pollutant identification, *Path of pollutants.
Identifiers: Preanalysis concentration, Optical paths.

To determine the concentration of heavy metal pollutants in the ecological biosphere, large samples must be collected and/or there must be a preanalysis concentration step. A need exists for experienced personnel. A device has been designed for the direct determination of heavy metal pollutants by atomic absorption spectroscopy. This uses a carbon bed atomizer for the reduction of metal pollutants to free atoms, and a heated quartz long path absorption tube to maintain the atoms in the light path in the free atomic state. Use of the instrument includes determination of cadmium in the atmosphere, in seawater, in biological fluids, in filter papers, and in plastics. It is also calibrated for air analysis. Attempts are being made to eliminate contamination in calibrating media. (Prague-FIRL)

EVOLUTION OF MONITORING FOR EARTHWATCH,
National Oceanic and Atmospheric Administration, Rockville, Md.
C. E. Jensen.

In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 1-6, 1974.

Descriptors: *Monitoring, *Pollutants, *Networks, *Environment, International commissions, Pollution abatement.
Identifiers: *Earthwatch.

Earthwatch is a global environmental assessment under the auspices of the new U.N. Environment Program. Earthwatch provides the needed framework for undertaking global environmental action, particularly in the area of monitoring. It provides for the international collaboration among nations, for the sharing of facilities and observational platforms, and for the assistance to developing countries to allow their full participation in global efforts. Earthwatch is built upon existing national and international capabilities and serves to integrate these capabilities using the Environment Fund to fill gaps where necessary and resulting in a comprehensive multidisciplinary global assessment effort. In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry Vol 14, No 1, p 7-10, 1974.

Descriptors: *Monitoring, *Water quality, Water quality control, Network design, *Optimization, Pollutant identification.

The first step in the design of a monitoring program is the establishment of a clear and unambiguous objective in quantitative terms. At the highest, or national level, information is necessary for broad planning purposes. At the second level, the regional level, all this information is necessary, plus the particular information needs for the region. The third, local level, consists usually of checking to ensure compliance with regulations and statutes. Ideally, the costs of collecting new data should be less than the benefits to be derived from these new data. (See also W74-10947) (Knapp-USGS)
W74-10949

VALIDATION OF ENVIRONMENTAL DATA BY INTERCALIBRATION AND LABORATORY QUALITY CONTROL PROGRAMS,
National Bureau of Standards, Washington D.C.
J. K. Taylor.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 11-15, 1974.

Descriptors: *Monitoring, *Laboratory tests, *Calibrations, *Analytical techniques, Chemical analysis, Data processing, Environment, Sampling, Standards, Statistics.
Identifiers: *Collaborative tests.

Accurate methodology, adequate calibrations, and systematic quality control procedures are required to provide reliable environmental quality data. A systems approach helps assure the validity of the data reported by individual stations and permits its incorporation into the body of data derived from diverse sources. The best method for development and evaluation of analytical methodology (and also for development of analytical expertise) is the time-consuming, evolutionary process of research, documentation in the literature, and critical examination by peers. A shorter and less adequate route is that of collaborative testing. A typical collaborative test consists of the circulation of identical samples to selected collaborators with the request to analyze by any familiar method. A second approach is to circulate a test material together with a specified method for measurement. (See also W74-10947) (Knapp-USGS)

NEED FOR COLLABORATIVE STUDIES OF STANDARD METHODS,
National Environmental Research Center, Cincinnati, Ohio. Water Supply Research Lab.
E. F. McFarren.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 16-20, 1974. 3 tab, 7 ref.

Descriptors: *Monitoring, *Laboratory tests, *Calibrations, Analytical techniques, Chemical analysis, Data processing, Environment, Sampling, Standards, Statistics.
Identifiers: *Collaborative tests.

Analytical quality control consists essentially of three programs or conditions: (1) using only methods that have been studied collaboratively and found acceptable, (2) routinely analyzing a control sample at least once on each day that unknown samples are analyzed, and (3) analyzing a few reference samples once or twice a year to confirm the ability of a laboratory to produce acceptable results. THE ASSESSMENT OF ENVIRONMENTAL IMPACT--WATER QUALITY AND QUALITY ASSURANCE CONSIDERATIONS,
Industrial Bio-Test Labs., Northbrook, Ill. Environmental Sciences Div.
J. J. Delfino.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 21-25, 1974.

Descriptors: *Monitoring, *Data collections, *Environment, Water quality act, Water quality, Pollution, Pollution abatement, Water pollution control, Pollutant identification.
Identifiers: *National Environmental Policy Act, *Environmental Impact Statements.

The widespread awareness and application of the philosophy and requirements of the National Environmental Policy Act of 1969 influence the way in which water quality surveys are now to be performed in support of environmental impact assessments. These surveys must be multidisciplined and consider physical and biological as well as chemical parameters. The work must be performed by well trained professionals who use modern techniques and instruments and who consistently practice good quality assurance procedures. If the quality of the large amount of water quality data now being generated matches the quantity, then meaningful impact assessments of the aquatic environment will result. Careful prior planning of long-term studies can yield valuable data which will aid in predicting potential environmental impacts and in forming the bases for designing alternative engineering solutions where needed. OVERVIEW OF THE CALIFORNIA AEROSOL CHARACTERIZATION EXPERIMENT,
Rockwell Science Center, Thousand Oaks, Calif.
G. M. Hidy, R. J. Charlson, S. K. Friedlander, D. Hutchison, and P. K. Mueller.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 26-28, 1974.

Descriptors: *Aerosols, *Smog, *California, Monitoring, *Air pollution, Pollution abatement, Sampling, *Pollutant identification.

Aerosols in urban and non-urban locations of California are studied in terms of their physical and chemical properties, their interaction with gases in the atmosphere, and their natural and anthropogenic origins. The amounts of atmospheric aerosol which can be related to primary emissions such as from auto exhausts or stationary sources, and secondary production due to physical and chemical processes taking place in the atmosphere are determined. Major sources of particles and chemically reactive gases which can be related to aerosol pollution and visibility reduction are identified. To characterize the behavior of urban aerosols, the physical and chemical properties of airborne particles are observed simultaneously with meteorological variables including winds, temperature, relative humidity and solar radiation, and trace gases including ozone, nitrogen oxides, ammonia, hydrocarbon vapors, carbon monoxide, hydrogen sulfide, and sulfur dioxide. (See also W74-10947) (Knapp-USGS)

In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 29-32, 1974. 2 fig, 2 ref

Descriptors: *Aerosols, *Smog, *California, Monitoring, *Air pollution, Pollution abatement, Sampling, Pollutant identification.

In 1972 the physical characteristics of aerosol were measured on several each of background, urban, and source related sites in the State of California as part of the Air Resources Board aerosol characterization study. In addition to meteorological and gas measurements, aerosol were sampled on filters, the Lundgren impactor and several other special samplers. Aerosol size distributions were measured by optical counter, electrical aerosol analyzer, condensation nuclei counter, and rotary impactor. (See also W74-10947) (Knapp-USGS)

In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 39-41, 1974. A Resources Board Contract No 358.

Descriptors: *Smog, *Air pollution, *California, *Aerosols, *Sulfates, *Nitrates, Sampling, Pollutant identification.

e physical and chemical properties of airborne rticles were observed at several different urban d non-urban sites in California. Meteorological d aerometric variables included such gases as ter vapor, ozone, nitrogen oxides, ammonia, lfur dioxide, hydrogen sulfide and reactive drocarbon vapors. The aerosol samples were llected sequentially at two hour intervals over a enty-four hour period for chemical analysis ng filters and impactors. Much of the total mass ncentration of airborne particles is composed of lfate, nitrate, ammonium, as well as other spe-s. Circumstantial evidence supports the fact t most of the sulfur and nitrogen compounds in rosols originate as gases and are transformed in e atmosphere to aerosols by reactions which are t exclusively photochemical in nature. IARACTERIZATION AND ANALYSIS OF RBORNE PARTICULATE MATERIAL BY IN-ARED SPECTROSCOPY,
gonne National Lab., Ill. Chemical Engineering v.
T. Cunningham, and S. A. Johnson.
Preprints of Papers Presented at the 167th Na-nal Meeting of the American Chemical Society, ril 1-5, 1974, Los Angeles, Calif: American emical Society, Division of Environmental emistry, Vol 14, No 1, p 42-43, 1974.

escriptors: *Air pollution, *Pollutant identifica-n, *Aerosols, Illinois, California, Sampling, eutron activation analysis, X-ray fluorescence, ame photometry, Chemical analysis.

alysis of the elemental composition of airborne rticulate material can be accomplished in a rou-e manner through the use of neutron activation, ray fluorescence, and atomic absorbtion. There significant variation in the chemistry of airborne rticulates as a function of both particle size and ze. Ammonium and sulfate ions account for the ectra of most stage IV (submicron) samples. rbonate, nitrate, silica and silicate, and drocarbon are clearly present in stage II and III mples. The spectra particles collected on stage II d III frequently have a strong sharp band which assigned to a surface nitrate species. This peak seldom strong in stage IV samples collected in e Chicago area but was important in submicron mples collected in the Los Angeles basin. In neral, the features observed in the spectra of age II and III samples display a variability with ne that is not clearly cyclic and appear to reflect e variability of local winds. This is consistent th the theory that particles greater than about e micron in diameter are introduced into the at-osphere by mechanical mechanisms. (See also 74-10947) (Knapp-USGS)

Gas chromatograph/mass spectrometer (GC/MS) systems are powerful tools for identifying specific environmental organic pollutants. Computerized GC/MS systems are especially suitable in a service laboratory doing routine monitoring of environmental samples. There are ten regional service laboratories and two National Field Investigation Center laboratories within EPA that have primary responsibility for environmental monitoring, industrial surveys, enforcement actions, and investigation of episodes such as fish kills or taste and odor problems. Descriptors: *Smog, *Sulfates, *Air pollution, *Aerosols, Central US, *Missouri, Pollutant identification.
Identifiers: *Sulfuric acid, *St. Louis(Mo).

Sulfuric acid and its neutralization products with NH3 exist and often dominate the submicrometer aerosol in and near St. Louis, but these substances may be normal intermediates in the cycling of sulfur through the atmosphere. The lack of dependence of composition on wind direction or synoptic condition suggests that these substances are regionally distributed and are not urban. It is likely that human sources of SO2 dominate based on consideration of known source strengths of sulfur compounds in this region. The sources of SO2 (mainly fossil fuel power plants) are located on a spatial scale of from 10-100 km in Missouri and the surrounding states. These compounds, which dominate the hazes in eastern Missouri, may also extend to the entire midwest. Such visible, turbid air is noted in summer from perhaps Topeka to the East Coast and from Chicago to Little Rock and only really disappears with massive intrusions of Canadian air in winter. Descriptors: *Air pollution, *Aerosols, *Dusts, Sampling, Statistics, *Distribution patterns, Particle size, Turbidity, *Pollutant identification.

The mass distribution of large atmospheric particulate matter was studied as a function of particle aerodynamic size. Aerodynamic size is defined as the diameter of a unit density sphere which settles at the same rate as the actual particle. Measurements were made under various conditions of wind velocity and direction in order to investigate the effect wind and aerosol source had on the mass distribution. Atmospheric particulate matter tends to have a bimodal mass distribution. Based upon the overall average distribution, the small particle mode peaked at about 0.5 micron diameter. For all sampling conditions the atmospheric aerosol had a large particle mode which peaked between 10 and 20 micron diameter. The small particle mode accounts for only one-half the particulate mass but about 99 percent of the particulate surface area and visibility reduction. (See also W74-10947) (Knapp-USGS)

Descriptors: *Monitoring, *Water pollution control, *Electrodes, Water analysis, Electrochemistry, Industrial wastes, Waste water treatment, *Pollutant identification.

Currently available chemical-sensing electrodes which are suitable for monitoring are discussed. Electrodes are relatively low cost devices, and have the advantages of responding in real time, of being able (as logarithmic devices) to cover a wide concentration range with the same precision, and of being able to function under adverse conditions of turbidity and color. By suitable chemistry, it is also possible to determine many species for which no specific electrode exists. (See also W74-10947) (Knapp-USGS)

COLORIMETRIC METHOD FOR THE DETERMINATION OF ARSENIC (III) IN AQUATIC ENVIRONMENT,
South Carolina State Coll., Orangeburg. Water Lab.
S. S. Sandhu, and R. Krishnamurthy.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, division of Environmental Chemistry, Vol 14, No 1, p 226-229, 1974. 8 ref.

Descriptors: *Arsenic compounds, *Chemical analysis, *Analytical techniques, Oxidation, Reduction(Chemical), Colorimetry, *Pollutant identification.

A simple analytical method is given for quantitative evaluation of arsenic (III) in an aquatic environment. Arsenic (III) is a reducing agent. Iodate ion is a good oxidizing agent and it is reduced by arsenic (III) to iodine. The liberated iodine is immediately extracted with carbon tetrachloride, which forms a loose complex imparting a characteristic pink color to the extractant. Iodine in organic phase is colorimetrically evaluated and arsenic (III) calculated. (See also W74-10947) (Knapp-USGS)

THE CARBON ROD ATOMIC ABSORPTION ANALYSIS OF ARSENIC IN PLANT AND ANIMAL TISSUES,
Los Angeles County Sanitation Districts, Whittier, Calif. San Jose Creek Water Quality Lab.
R. Baird, and S. Gabrielian.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 230-233, 1974. 3 tab, ref.

Descriptors: *Flame photometry, *Spectrophotometry, *Arsenic compounds, *Pollutant identification, *California, Path of pollutants, Chemical analysis.
Identifiers: Atomic absorption spectrophotometry, Los Angeles County(Calif).

Carbon rod techniques for atomic absorption were successfully employed for the analysis of arsenic in wastewaters, sediments, plants, and marine animals. Lyophilization followed by acid digestion (ambient pressure) or acid bomb digestion (high pressure) offers the most promising methods for preparing representative biological samples for atomic absorption analysis of arsenic. There is no clear gradient of arsenic concentrations in fish and shellfish specimens collected around the Los Angeles County Palos Verdes sewage outfall. The levels of arsenic found in brown algae (kelp) specimens seem to be higher near the point of discharge. (See also W74-10947) (Knapp-USGS)
W74-10985

EVALUATION OF DIGESTION TECHNIQUES FOR THE AAS DETERMINATION OF META CONCENTRATIONS IN KELP,
Los Angeles County Sanitation Districts, Whittier, Calif. San Jose Creek Water Quality Lab.
S. Pourian, M. Smith, S. Gabrielian, and R. Baird.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 237-244, 1974. 3 tab, ref.

Descriptors: *Flame photometry, *Spectrophotometry, *Arsenic compounds, *Pollutant identification, *California, Path of pollutants, Chemical analysis.
Identifiers: Atomic absorption spectrophotometry.

Approximately half of the metal loadings in the Southern California coastal waters result from the discharge of treated domestic and industrial wastes from sewage treatment plants. Kelp stands near the major Los Angeles County outfall contain metal concentrations significantly higher than those farther away from the discharge point. In order to differentiate between the concentration of cellular metals and surface-absorbed metals the washing technique does not leach metals from the cells. Atomic absorption spectroscopy is the analytical tool used. (See also W74-10947) (Knapp-USGS)

escriptors: *Organic compounds, Chromatography, *Spectrophotometry, Pollutant identification, Waste water treatment, nalytical techniques, Chemical analysis.
ientifiers: *Benzidine.

he most useful technique for the estimation of enzidine in wastewater is a colorimetric deter-ination of aniline derivatives. Although thin yer chromatography (TLC) and gas-liquid chro-atography have not been described specifically r the analysis of benzidine in aqueous systems, ey present possibilities as analytical tools. ualitative IR identifications of benzidine and her aromatic amines were performed on a spec-ophotometer which was fitted with a beam con-enser having KBr optics. Compounds developed y TLC were extracted from Silica Gel G with 2 ml spectrograde methanol, and concentrated to 0.5 l. From 5-10 microliters of this extract were rectly administered to dried spectroscopic grade Br in a 1.5 mm ultra-micro pellet die before vacuation and pressing. This technique was capa-e of producing satisfactory spectra on as little as microgram of benzidine using a 20x scale expan-on of the instrument. For identification, spectra ere compared to 1-10 microgram benzidine stan-rds prepared in 1.5 mm pellets. (See also W74-0947) (Knapp-USGS)

dentifiers: Pasadena(Calif).

o determine the sources of the aerosol in asadena, California, particulate samples were ollected almost continuously for 29 days from 30 ctober to 27 November, 1972. Two filters, which ere changed simultaneously every 2 hours, were sed to collect particles in 2 size ranges: from bout 20 microns to 0.01 microns and from 1.5 icrons to 0.01 microns in diameter. The elemen-al compositions of the two sets of filters were nalyzed by an X-ray fluorescence spectrometer. b and Br meet criteria for automobile exhaust articulates, and Fe, Ti, and Mn meet criteria for oil dust. Ni and Zn come from 2 different sources, different from one another and different from automobile exhaust and soil dust. It appears likely that the measured Ca, above that expected from the soil dust, comes from cement and that the Ni comes from fuel oil fly ash. Primary automobile exhaust particulate matter contibutes 17% of the total particulate mass, soil dust contributes 26%, cement dust contributes less than 1%, fuel oil fly ash contributes about 2%. The average particulate mass during the November 16-27 period was 31.7 micrograms per cu m. (See also W74-10947) (Knapp-USGS)

A SPECTROSCOPIC STUDY OF PASADENA SMOG,
National Environmental Research Center, Research Triangle Park, N.C.
P. L. Hanst, W. E. Wilson, R. K. Patterson, B. W. Gay, and L. W. Chaney.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 287-294, 1974. 5 fig, 1 tab.

Descriptors: *Air pollution, *Smog, *California, Nitrates, Organic compounds, Sampling, *Spectroscopy, Infrared radiation, Ozone, Pollutant identification.
Identifiers: Pasadena(Calif).

An application of long path infrared spectroscopy to air pollution in Pasadena yielded data of value in interpreting the chemistry of the smog. In the late summer of 1972 a Fourier Transform spectrometer and long path cell were set up on the roof of the Keck Engineering Building at the California Institute on Technology. In the summer period the carbon monoxide and hydrocarbon levels were about half as high as on Fall mornings and evenings. On July 24 and 25, 1973, ozone concentrations reached 0.60 and 0.68 ppm. On those days, carbon monoxide was only about 3 ppm, methane 2 ppm, and non-methane hydrocarbon about 1.0 ppm carbon. Acetylene was 0.030 ppm and ethylene only 0.007 ppm, reflecting the stagnant condition of the air and the high extent of reaction. Formic acid was identified as the organic reaction product in highest concentration, at 0.050 ppm. A substantial portion of the hydrocarbon in the air was oxidized by the end of the day. Because the only gaseous nitrate was peroxy acetyl nitrate, which only accounts for about one-fourth of the input NO, it is presumed that particulate nitrate was formed. PHOTOCHEMICAL REACTIONS IN A DUAL OUTDOOR SMOG CHAMBER,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
H. Jeffries, D. Fox, R. Kamens, and L. Ripperton.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 295-297, 1974. 1 fig.

Descriptors: *Air pollution, *Chemical reactions, Equipment, Sampling, Solar radiation, Monitoring, Pollutant identification.

A dual smog chamber is enclosed by clear 5 mil PEP Teflon film. The chamber allows the reactants to be exposed to ambient sunlight and temperature profiles as they exist during the daytime. By having two compartments exposed to the same ambient conditions, it is possible to measure directly the effects of different reactant concentrations. The facility is designed to investigate the chemical behavior of urban atmospheric pollution. (See also W74-10947) (Knapp-USGS)

DETECTION OF HYDROCARBONS BY CHEMILUMINESCENCE WITH ACTIVE NITROGEN AT 388 NM,
Environmental Protection Agency, Research Triangle Park, N.C.
T. W. Baity, W. A. McClenny, and J. P. Bell.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 310-312, 1974. 2 tab.

Descriptors: *Monitoring, *Air pollution, Smog, Organic compounds, Nitrogen, Instrumentation, Fluorescence, Analytical techniques, Pollutant identification.
Identifiers: *Chemiluminescence.

A chemiluminescent method measures the hydrocarbon levels in a gas sample by the intensity of the individual hydrocarbon reactions with active nitrogen. Of all the hydrocarbons tested propylene gave the largest response. At 100 ppm the signal for propylene is about ten times greater than the background signal measured with zero air in the sample inlet. Since the minimum measurable concentration of even the more responsive hydrocarbons is greater than 1 ppm, the system in present form is suitable only for mobile source emissions measurements, and not for ambient air monitoring. (See also W74-10947) (Knapp-USGS)
W74-11000

A COLORIMETER SYSTEM FOR DETERMINATION OF THE METHOD 6 THORIN TITRATION ENDPOINT,
National Environmental Research Center, Research Triangle Park, N.C.
C. E. Rodes.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 313-320, 1974. 4 fig, 2 tab, 2 ref.

Descriptors: *Air pollution, *Pollutant identification, *Sulfates, *Volumetric analysis, *Color reactions, Monitoring, Sulfur.
Identifiers: *Sulfur dioxide.

The analysis of stack concentrations of SO2 has always been uncertain especially when the analyses must be made in the field. Consistent determination of the thorin titration endpoint, in which the solution color changes from a straw yellow to a pink-orange is difficult. An automatic titrator was designed to assist in determining the endpoints, and to speed up the analyses of multiple samples. A strip chart recorder is used with a peristaltic pump. A simple endpoint detection system is rugged enough to take into the field. (See also W74-10947) (Knapp-USGS)

OPERATION CHARACTERISTICS OF NO2 PERMEATION DEVICES,
National Bureau of Standards, Washington, D.C.
H. L. Rook, E. E. Hughes, R. S. Fuerst, and J. H. Margeson.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 321-328, 1974. 6 fig, 1 tab, 7 ref.

Descriptors: *Chemical analysis, *Nitrogen compounds, *Air pollution, *Pollutant identification, Separation techniques.
Identifiers: *Nitrogen dioxide.

Permeation devices can produce reliable calibration atmospheres of trace NO2 if careful controls are replaced on the gravimetric calibration and use of the devices. Conditions which would effect permeation rate and long term stability were studied. Parameters studied include temperature, humidity, physical shock, NO2 purity, and calibration procedures. (See also W74-10947) (Knapp-USGS)
W74-11002

A PIEZOELECTRIC SENSOR FOR MERCURY IN AIR,
National Bureau of Standards, Washington, D.C.
E. P. Scheide, and J. K. Taylor.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 329-335, 1974. 4 fig, 9 ref.

Descriptors: *Air pollution, *Pollutant identification, *Mercury, *Monitoring, Instrumentation.
Identifiers: *Piezoelectric sensors.

A quartz piezoelectric crystal detector with gold on the electrode as the sensor substrate can be used for the detection of mercury vapor in an air sample. Linear calibration curves were obtained from part per million to sub part per billion concentrations. Reversibility was achieved by a heat desorption cycle. This detector has potential use as both an air pollution sensor and in industrial hygiene applications. Instrumentation is relatively inexpensive and can be easily used in the field. Analysis is nondestructive and requires very little time. (See also W74-10947) (Knapp-USGS)
W74-11003

THE FLUORESCENCE DETECTION OF NITRIC OXIDE,
National Bureau of Standards, Washington, D.C.
F. P. Schwarz, and H. Okabe.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 336-343, 1974. 2 fig, 2 tab, 6 ref.

Descriptors: *Monitoring, *Air pollution, Smog, Organic compounds, Nitrogen, Instrumentation, Fluorescence, Analytical techniques, Oxides, *Pollutant identification.
Identifiers: *Chemiluminescence, Nitric oxide.

NO can be detected in NO-air mixtures and in automobile exhaust. The principle of detection is based on measuring the intensity of the fluorescence of NO excited by light of wavelength 2138A. The fluorescence intensity is proportional to the product of the NO concentration multiplied by the 2138A light intensity. Photon counts of both the fluorescence intensity and the 2138A light intensity are converted into a ratio which is proportional only to the NO concentration in a gas mixture. The SO2 present in automobile exhaust also absorbs the 2138A radiation but fluoresces at a longer wavelength region. It would not interfere with the NO measurement if a proper fluorescence transmission filter is used. (See also W74-10947) (Knapp-USGS)
W74-11004

CHEMICAL ANALYSIS OF THE SMOKY-BURNT ODOR COMPLEX IN DIESEL EXHAUST,
Little (Arthur D.), Inc., Cambridge, Mass.
A. B. Caragay, D. A. Kendall, and P. L. Levins.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 344-349, 1974. 2 tab, 2 ref.

Descriptors: *Air pollution, *Odor, *Organic compounds, Oil, Air pollution effects, *Pollutant identification, *Chemical analysis.

The smoky odor character of diesel exhaust is associated with hydroxy and methoxy indanones with some contributions from methyl and methoxy phenols. Burnt odors are associated with furans and alkyl benzaldehydes. The oxidized oily character is usually ascribed to alkenones, dienones, hydroxy cyclocarbonyls, and indanones. Irritation factors seem most frequently to be associated with the lower molecular weight phenols. Some benzaldehydes and methoxy benzenes may also contribute to this sensation. Neither sulfur nor nitrogen-containing species contribute to the smoky-burnt odor complex. The major source of the most significant odor contributors in this group appears to be the aromatic portion of the fuel, although some contribution is also from the paraffin portion. AN AUTOMATED INSTRUMENT FOR THE CONTINUOUS MEASUREMENT OF REACTIVE HYDROCARBONS,
Ontario Research Foundation, Sheridon Park.
S. C. Barton, and E. N. Turner.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 356-359, 1974. 1 fig, 9 ref.

Descriptors: *Monitoring, *Air pollution, *Organic compounds, Smog, Colorimetry, Chemical reactions, Radioactive wastes, *Pollutant identification, Instrumentation, Automation.
Identifiers: *Radioactive hydrocarbon.

A method for monitoring reactive hydrocarbons is based upon the relative reactivity of different hydrocarbons with ozone. An air sample flows through a small photochemical reactor in which all hydrocarbons react in proportion to their photochemical reactivity to form aldehydes and ketones as major reaction products. Colorimetric determination of the total carbonyl products then provides a direct measurement of the total photochemical reactivity of the hydrocarbons in the air. (See also W74-10947) (Knapp-USGS)
W74-11007

INTERCOMPARISON OF SEVERAL TYPES OF CASCADE IMPACTORS,
Maryland Univ., College Park. Dept. of Chemistry.
G. E. Gordon, E. S. Gladney, J. M. Ondov, T. J. Conry, and W. H. Zoller.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 367-370, 1974. 1 fig, 9 ref.

Descriptors: *Sampling, *Dusts, *Aerosols, *Air pollution, Equipment, Calibrations, Particle size, *Pollutant identification.
Identifiers: *Cascade impactors.

Size distribution of atmospheric particles is found by separation of the particles into various size ranges with a cascade impactor prior to the analysis. This study is designed to determine the seriousness of wall losses and bounce-off for three types of impactors in common use. In the first series of experiments, three types of impactors and a filter were run side by side for comparison of apparent size distributions for certain elements. Then two identical impactors were run side by side, one with plastic collections surfaces, the other with plastic to which a sticky material had been added in order to prevent bounce-off. The three impactors were: a 4-stage Lundgren, a five-stage Andersen Sampler as modified for use by the National Air Surveillance Network, and a six-stage Scientific Advances Impactor. A NATIONAL OVERVIEW OF EXISTING COASTAL WATER QUALITY MONITORING.
Interstate Electronics Corp., Anaheim, Calif. Oceanics Div.
Available from NTIS, Springfield, Va 22161 as PB-226 483, Price $10.00 printed copy; $2.25 microfiche. Contract Report 445-A, Phase A, for Environmental Protection Agency, December 6, 1972. 514 p, 9 fig, 35 tab, 15 append. EPA Contract 68-01-0160.

Descriptors: *Monitoring, *Water quality, *Coasts, *Estuaries, Sea water, Water pollution sources, Water pollution control, *Data collections.

An overview of coastal water quality monitoring activity is presented, including an examination of related factors such as water quality standards, population, waste discharges, ocean dumping, and a survey of data banks at the national level. This broadly based information, supported by detailed data from selected case study areas, is for use in the formulation of a national plan for monitoring coastal water quality. Data from several inventories pertinent to coastal zone water quality are summarized to the state and EPA regional level with extensive descriptions contained in appendices. In general, no significant correlative relationship was found between monitoring activities and any of the other factors studied. However, a large amount of data was accumulated, summarized and presented in a form useful in the management and planning of coastal zone water quality monitoring networks. (Knapp-USGS)

NALYSES OF PAPER MACHINE WATERS ITH ION-SPECIFIC ELECTRODES. PART I. EFFECT OF PH AND IONIC STRENGTH OF SOLUTION ON CALCIUM, CUPRIC, CHLORIDE, SODIUM, AND NITRATE ION SPECIFIC ELECTRODES,
Valmet Oy, Jyaskyla (Finland).
J. Korhonen, P. O. Lumme, and L. J. Kinnunen.
Paperi ja Puu (Papper och Tra), Vol 55, No 8, p 559-561, 564-566, 569-570, Aug 1973. 11 fig, 10 tab, 9 ref.

Descriptors: Water analysis, Waste water(Pollution), Analytical techniques, *Electrodes, *Anions, *Cations, *Potentiometers, *Pulp wastes, Water pollution sources, *Pollutant identification, Instrumentation, Hydrogen ion concentration, Industrial water, Industrial wastes, Calibration, Ions, Chemical analysis, Calcium, Chlorides, Copper, Sodium, Nitrates, Thermodynamics.
Identifiers: *White water(Paper machine effluent), Concentration(Chemicals), Ionic strength.

The purpose of this study was to measure the concentrations of various cations and anions that are generally present in paper-machine waste waters (white water), using ion-specific electrodes, and to define the factors influencing electrode calibration and direct concentration measurements. After an initial examination of the pH dependence of electrode potentials, the results were used to estimate the pH ranges in white waters over which the electrode behavior was independent of pH. The effect of ionic strength on electrode response was also explored. Electrode potentials were shown to follow the ionic activity factor's dependence upon ionic strength. (See also W74-11094) (Brown-IPC)
W74-11093

ANALYSES OF PAPER MACHINE WATERS WITH ION-SPECIFIC ELECTRODES, PART II. CALCIUM, CUPRIC, CHLORIDE, SODIUM AND NITRATE ION SPECIFIC ELECTRODE POTENTIALS AT VARIOUS TEMPERATURES AND IN COMPOSITE SOLUTIONS,
Valmet Oy, Jyaskyla (Finland).
J. Korhonen, P. O. Lumme, and L. J. Kinnunen.
Paperi ja Puu (Papper och Tra), Vol 55, No 9, p 646-648, 651-652, 655-656, Sept 1973. 4 fig, 9 tab, 7 ref.

Descriptors: Water analysis, Waste water(Pollution), Analytical techniques, *Electrodes, *Anions, *Cations, *Potentiometers, *Pulp wastes, Water pollution sources, *Pollutant identification, Instrumentation, Temperature, Thermal pollution, Calibrations, Ions, Chemical analysis, Calcium, Chlorides, Copper, Sodium, Nitrates, Industrial water, Water sampling.
Identifiers: *White water(Paper machine effluent), Concentration(Chemicals).

The effect of temperatures typical of white waters (paper machine effluent) on the electrode potentials of various contaminant ions (Ca, Cu, Na, chloride, and nitrate) was measured in order to estimate the admissible standard and sample temperature differences. Interferences were studied by measurements in pure metal chloride and sodium salt solutions. The accuracy of the electrodes was tested in a synthetic white water formulation. Based on the results obtained, recommendations are made for achieving maximum accuracy in direct concentration measurements. (See also W74-11093) (Brown-IPC)
W74-11094

THE DETERMINATION OF VANADIUM IN SEA WATER BY HOT GRAPHITE ATOMIC ABSORPTION SPECTROMETRY ON CHITOSAN AFTER SEPARATION FROM SALT,
Bologna Univ. (Italy).
R. A. A. Muzzarelli, and R. Rocchetti.
Analytica Chimica Acta, Vol 70, No 2, p 283-289, June, 1974. 3 fig, 3 tab, 9 ref.

Descriptors: *Sea water, *Analytical techniques, *Water analysis, *Chemical analysis, *Pollutant identification, Water pollution, Ion exchange, Trace elements, Water chemistry, Metals, Spectrometers, Anion exchange.
Identifiers: *Vanadium, Chitosan, *Italy(Cape Conero).

A method has been developed for the determination of V in sea water. It is based on the anion-exchange behavior of chitosan toward the metavanadate ion. Filtered and acidified sea water is passed through a 500mg chitosan column, and the V is determined by atomic absorption spectrometry with a graphite furnace and a deuterium background corrector on 5mg aliquots of the homogenized column. The procedure is suitable for use on board ships, as many samples can be handled by one technician; the columns can run unattended and can be sealed and stored for later analysis. Because only a small aliquot of the polymer from a column is used for a determination, replicate analyses can be done on the same column, and the residue can be stored indefinitely. Vanadium can be eluted from a chitosan column with sulfuric acid or ammonia, and the column can be used again. Two sea water samples collected a few km offshore of Cape Conero, Ancona, Italy, gave 0.71 plus or minus 0.09 and 0.52 plus or minus 0.04 micrograms of V/l. (Witt-IPC)
W74-11109

FLUORIMETRIC DETERMINATION OF CARBOHYDRATES IN SEA WATER,
Kinki Univ., Osaka (Japan). Dept. of Fundamental Education.
H. Hirayama.
Analytica Chimica Acta, Vol 70, No 1, p 141-148, May 1974. 4 fig, 3 tab, 12 ref.

Descriptors: *Water analysis, *Sea water, *Carbohydrates, Fluorescence, Biochemical oxygen demand, Solutes, Activated carbon, Adsorption, Electrodialysis, Ion exchange, Desalination, Sewage, Fluorescence, Spectroscopy, Analytical techniques, Waste identification, *Pollutant identification.
Identifiers: Hexoses, Pentoses, Furfural, Glucose.

Fluorimetry of pentoses with anthrone and of hexoses with 5-hydroxy-1-tetralone was used for analysis of sea water after preliminary separation of these sugars by adsorption on activated carbon and by ion-exchange electrodialysis. Activated carbon was suitable for the separation and concentration of hexose sugars but not of pentoses. Electrodialysis allowed complete desalination without loss of carbohydrates. The pentose and hexose contents could be determined after evaporation of sea water under reduced pressure. Several sea water samples were thus analyzed. Their pentose content (expressed as furfural) was 225-288 microgram/l, but their hexose content (expressed as glucose) varied widely from 250 to 1670 microgram/l, owing to contamination by sewage. (Brown-IPC)
W74-11110

MAKE WATER POLLUTION CONTROL A MEANINGFUL LOCAL RESPONSIBILITY,
Muncie Sanitary District, Ind., Water Quality Div.
J. M. Craddock.
The American City, Vol 63, No 4, p 63-64, May, 1974.

Descriptors: *Water quality control, *Monitoring, *Laboratory testing, Environmental effects, Pollution, Chemical oxygen demand, Dissolved solids, Suspended solids, Jar testing, Vacuum filters, Industrial wastes, Biochemical oxygen demand, Water resources, Costs, *Regulation, *Pollutant identification, *Indiana.
Identifiers: Local control, *Muncie(IN).

The Muncie Sanitary District has established a Division of Water Quality. The division is a testing and enforcement agency involved in laboratory

testing, industrial monitoring, and local government. Laboratory equipment includes an oil-extraction unit, COD apparatus, a pH meter, vacuum filter for suspended solids, jar test equipment, field dissolved oxygen meters, and automatic field samplers. More than 20 pollution discharges have been stopped. Because about 80 industrial and commercial establishments are in the Muncie area, samplers now monitor BOD5, COD, heavy metals, and suspended solids. Benefits relate to the community's public health, added recreational value of water resources, added revenue through equitable waste-industry charges, and regulation by local rather than state and federal agencies. (Prague-FIRL)

A STUDY OF THE POSSIBILITY OF INDICATING BACTERIA IN WATER BY A SPECTROULTRAMICROSCOPIC METHOD, (IN RUSSIAN),
Academy of Municipal Economy, Moscow (USSR). Research Inst. of Public Water Supply, Water Purification.
V. N. Artemova.
Gig Sanit. Vol 37 No 9 p 75-78, 1972. Illus.

Descriptors: *Electron microscopy, Filters, Bacteria, *Analytical techniques, *Bioindicators, Pollutant identification.
Identifiers: Bacillus anthracoides, Bacillus mesentericus, Escherichia coli, Shigella sonnei, Streptococcus faecalis.

An apparatus based on electronmicroscopy and fractional analysis with special light filters can be used to differentiate bacteria from each other and from other particles. This method is tested on water seeded with Escherichia coli, Shigella sonnei isolated from patients, Streptococcus faecalis, Bacillus mesentericus and B. anthracoides. Each bacteria appeared in a specific fraction except for Str. faecalis and B. mesentericus which, due to agglomeration or the presence of various stages of spore formation, appeared in several areas. This method could possibly be automated.--Copyright 1974, Biological Abstracts, Inc.

HISTORY OF METAL POLLUTION IN SOUTHERN CALIFORNIA COASTAL ZONE,
Scripps Institution of Oceanography, La Jolla, Calif.
K. W. Bruland, K. Bertine, M. Koide, and E. D. Goldberg.
Environmental Science and Technology, Vol 8, No 5, p 425-432, May, 1974. 3 fig, 7 tab, 10 ref.

Descriptors: *Metals, *Pollution, *Sediments, *Measurements, Analytical techniques, Lead, Zinc, Chromium, Silver, Sampling, Water pollution, Human resources, Storm runoff, Coastal areas, Environmental effects, Atmosphere, *California, *Pollutant identification.
Identifiers: San Pedro(CA), Santa Monica(CA), Santa Barbara(CA), Anthropogenic fluxes.

Measurements were made of the anthropogenic and natural fluxes of elements into the sediments of the San Pedro, Santa Monica, and Santa Barbara Basins, off the coast of Southern California. Elements included Pb, Cr, Cd, Zn, Cu, Ag, V, and Mo. Use of the sedimentary record to reveal metal fluxes to the environment is dependent upon rapid removal of metal from water following its entry. By identifying those elements whose fluxes to the sediments as a result of human activities are significant compared with natural mobilization rates, transport paths from the continents to the sediments for individual elements are indicated. These account for waste outfalls, river and storm runoff, and composition of the atmosphere. Conclusions include marked similarity in the anthropogenic sedimentary fluxes and the rainfall fluxes, indicative that atmospheric transport of these metals to the coastal areas and the area of the Soledad Basin are a possible explanation. (Prague-FIRL)

MERCURY CONTAMINATION OF VEGETATION DUE TO THE APPLICATION OF SEWAGE SLUDGE AS A FERTILIZER,
Toronto Univ. (Ontario). Inst. of Environmental Sciences and Engineering; Toronto Univ. (Ontario). Dept. of Geology; and Toronto Univ. (Ontario). Dept. of Chemistry.
J. C. Van Loon.
Environmental Letters, Vol 6, No 3, p 211-218, 1974. 1 tab, 7 ref.

Descriptors: *Vegetation, *Mercury, *Sewage sludge, *Contamination, Soil contamination, Experimentation, Soil surfaces, *Tomatoes, Absorption.
Identifiers: Washed materials.

Vegetation grown on sludged and control plots were tested for mercury content. Washed and unwashed samples were tested. Materials tested included leaves and seeds of wild barley and quack grass; tomato roots, plants and fruit; bean roots, plants and pods; carrot roots and tops; and lettuce leaf. Only tomato fruit showed an increase in mercury levels for the washed plant material from the sludged plot. In this case, levels were up to fifty times higher than those of specimens from unsludged plots. Further investigation is recommended of surface contamination of vegetation by mercury containing dusts and soils which can cause elevated levels in unwashed material. (Prague-FIRL)

FLUORESCENCE SPECTROSCOPIC DETERMINATION OF ANTI-OVULATORY STEROIDS IN WATER AND WATER AND WASTE WATER ON THE THIN LAYER CHROMATOGRAPHY PLATE, (IN RUSSIAN),
Muenster Univ. (West Germany). Hygiene-Institut.
M. Kirchner, H. Holsen, and K. Norpoth.
Zentralbl Bakteriol Parasitenkd Infektionskr Hyg Erste Abt Orig Reihe B Hyg Praev Med Vol 157, No 1, p 44-52, 1973. Illus. English summary.

Descriptors: *Chromatography, *Fluorescence, Spectroscopy.
Identifiers: Chlormadinone acetate, Ethinyl es
tradiol, Ethynodiol, Lynestrenol, Medroxy
Megestrol, Mestranol acetate, Norethisterone
Noregestrel, Progesterone, Steroids.

Anti-ovulatory steroids can be determined quan
titatively and qualitatively from aqueous media or
the thin-layer chromatography plate by means o
fluorescence spectroscopy. The procedure wa
tested for all the steroid components of anti-ovula
tory preparations available in the Federal republi
of Germany (ethinylestradiol, ethynodio
diacetate, chlormadinone acetate, lynestrenol
medroxyprogesterone acetate, megestrol acetate
mestranol, norethisterone acetate and norgestrel
With the exception of ethynodiol diacetate) all th
compounds were clearly identified chromato
graphically because of their stability in doubl
distilled water. The evaluation of the chromato
gram with the Zeiss PMQ II spectrophotomete
and Metrawatt's Servogor Recorder produce
linear calibration functions in the lower nmol
range. Megestrol acetate, which responded par
ticularly sensitively, could still be detected quan
titatively in amounts of 5-10 ng. The analytica
method attains an accuracy of measurement o
plus and minus 5% with triple determinations wit
the use of reference substances. In the determina
tion of steroids in aqueous solutions, the loss o
substance can amount to 8% of the expecte
value. The method has proved useful in ascertain
ing solubility in water and in various waste wate
tests as well as in the study of the decompositio
of estrogens and progestagens in activated sludge.

WATER QUALITY PARAMETER MEASUREMENT USING SPECTRAL SIGNATURES,
Texas A and M Univ., College Station. Remot
Sensing Center.
P. E. White.
Available from NTIS, Springfield, Va 22161 a
N73-25141, Price $5.75 printed copy; $2.2
microfiche. Technical Report RSC-42, May 1973
159 p, 25 fig, 23 tab, 23 ref, append. NASA Gran
NGL 44-001-001.

Descriptors: *Remote sensing, *Water quality
*Regression analysis, Water pollution, Path of pol
lutants, Data collections, Data processing, Sola
radiation, Pollutant identification.

Water quality parameters influence remotel
sensed spectral signatures. Regression analysi
was applied to the problem of measuring wate
quality parameters from remote sensing spectra
signature data. The equations necessary to per
form regression analysis and methods of testin
the strength and reliability of a regression ar
described. An efficient algorithm is given fo
selecting the optimal subset of the independen
variables available for a regression. To illustrat
the regression techniques, they were applied to
particular set of data from the Houston Ship Chan
nel. (Knapp-USGS)

QUALITY OF BERLIN SURFACE WATERS MEASURING SCHEME, (DAS GUTEMESS PROGRAMM DER BERLINER OBERFLACHENGEWASSER),
H. Frenzel, and F. Sarfert.
Umwelthygiene, Vol 25, No 5, p 97-99, 1974. 1 fig 2 ref.

Descriptors: *Water quality, *Surface water, *Measurement, *Data processing, Monitoring, Automation, *Pollution identification.
Identifiers: Physical parameters, Chemical parameters, Bacteriological parameters, *Biological parameters, *Radiological parameters, *Berlin(Germany).

A scheme to measure the quality of Berlin surface waters has been extended to 98 sampling points. The program includes the examination of physical/chemical, bacteriological, biological, and partly, radiological parameters. It was necessary to make arrangements between the particupating laboratories as to the methods of analysis to be used. The resulting data will be subject to automatic data processing. (Shaffer-FIRL)

HOW TO MEASURE AMBIENT POLLUTION,
Philips Gloeilampenfabrieken, Eindhoven (Netherlands).
S. M. de Veer.
La Tribune du Cebedeau, Vol 27, No 364, p 129-133, March, 1974. 5 fig, 6 ref.

Descriptors: *Monitoring, *Remote sensing, *Data transmission, Costs, Water pollution, Water quality measurement, Air pollution, Automation, *Pollutant identification.
Identifiers: Netherlands, Field measurement.

The best way to measure ambient pollution quite often depends on the reason why one wishes to measure it. Efficient control is only possible if the feedback control loop 'process-measurement-control' is closed and all three segments are working optimally. For adequate pollution control continuous measurement is required. Field monitoring is usually done without an operator or data processor on hand. Extra reliability of the monitoring equipment is therefore essential. Automatic calibration, representative sampling, proof against environmental influences, and automatic data transmission are necessities of remote monitoring. Examples are given of the development of monitors for air and water pollution meeting the above requirements. The application and costs of monitoring are discussed. (Shaffer-FIRL)

COUGHING FISH MAY MONITOR WATER QUALITY.
Chemical and Engineering News, Vol 52, No 20, p 34, May 20, 1974.

Descriptors: *Fish, *Water quality, *Monitoring, Bioassay, Mervury, Copper, *Bioindicators, Pollutant identification.

The tendency of some species of fish to 'cough' (or make a similar sound) may be useful in monitoring water quality in lakes and streams. Tests have shown that concentrations of copper and mercury that inhibit growth and reproduction also cause an increase in the frequency of coughing. The coughing is a normal process that clears the gills of debris. Fish known to exhibit this behavior include bluegill, sunfish, fathead minnows, and all trout and salmon. Testing is underway on ten heavy metals and pesticides to see if, indeed, this type of bioassay would be reliable. (Shaffer-FIRL)

WATER AND EFFLUENT INSTRUMENTATION MADE SIMPLE,
Taylor Instrument Companies, Rochester, N.Y.
C. Maddinson.
Water Services, Vol 78, No 938, p 116-117, April 1974. 5 fig.

Descriptors: *Sewage treatment, *Instrumentation, *Flow measurement, *Water pollution control, Application methods, Effluents, Pressure, Waste water treatment, *Pollutant identification.
Identifiers: Magnetic flow meter, United Kingdom.

A considerable amount of money will be spent in England during the next few years on sewage treatment representing a growth for the instrument industry, though instrumentation represents but a small percentage of the expenditures anticipated. Discussed are various sewage flow measurement techniques such as level, differential pressure, and venturi measurements or the use of a magnetic flow meter. Also mentioned are pollution control devices and applications to pumping and speed control. (Sandoski-FIRL)

THE SOLVENT EXTRACTION ATOMIC ABSORPTION ANALYSIS OF EFFLUENTS AND WATER,
Sussex River Authority (England).
A. Lloyd.
Water Pollution Control, Vol 73, No 2, p 224-229, 1974. 1 fig, 4 tab, 16 ref.

Descriptors: *Solvent extractions, *Spectrophotometry, *Analytical techniques, *Metals, Effluents, Effluent streams, *Pollutant identification.
Identifiers: *Ammonium pyrollidine dithiocarbamate/Methyl isobutyl ketone system, Wet oxidation, Atomic absorption spectrophotometry.

The application of solvent extraction atomic absorption spectrophotometry (AAS) to the analysis of effluents and stream samples provides a rapid and accurate means of determining a variety of metals at the microgram/liter level. The ammonium pyrollidine dithiocarbamate/methyl isobutyl ketone system, which uses simple AAS equipment, can be applied to an even wider range of metals including Ag, Hg, and As9. The most important step in the analysis is the extraction stage, and potential interferences are likely to be of a chemical nature involving a lowering of the extraction efficiency of the chelate. When wet oxidation is necessary or when the sample contains a diversity of metals at the mg/liter level, a double extraction is required. However, for relatively clean samples a single extraction is suitable. Standard addition offers the advantage of allowing a single extraction to be applied to a wide range of sample types. (Sandoski-FIRL)
W74-11260

A MODIFIED ION EXCHANGE TECHNIQUE FOR THE DETERMINATION OF STABILITY CONSTANTS OF METAL-SOIL ORGANIC MATTER COMPLEXES,
California Univ., Berkeley. Dept. of Soils and Plant Nutrition.
M. S. Ardakani, and F. J. Stevenson.
Soil Science Society of America Proceedings, Vol 36, No 6, p 884-890, November-December, 1972. 7 fig, 6 tab, 19 ref.

Descriptors: *Ion exchange, Humic acids, Humus, Chelation, *Analytical techniques, *Pollutant identification, *Organic matter, Soils.

Calculation methods based on Schubert's ion-exchange equilibrium method were developed for determining stability constants of metal-soil organic matter complexes. The methods, which were free of certain assumptions and errors inherent in the ion-exchange technique as applied previously to soil organic matter, were verified using Mn (II)-citrate and Mn (II)-oxalate systems. Apparent stability constants (log K) of Zn (II)-humic acid complexes varied from 3.13 to 5.13 at pH 6.5. (Skogerboe-Colorado State)

DETERMINATION OF LEAD USING CHARGED PARTICLE ACTIVATION ANALYSIS,
Texas A and M Univ., College Station. Dept. of Chemistry.
D. C. Riddle, and E. A. Schweikert.
Analytical Chemistry, Vol 46, No 3, p 395-398, March, 1974. 1 fig, 6 tab, 22 ref.

Descriptors: *Lead, *Analytical procedures, Tracers, Radioisotopes, Trace elements, Distribution, *Pollutant identification.
Identifiers: *Activation analysis(Charged particle).

Investigations are reported of charged particle activation applied to the trace lead and lead isotope ratio analysis using proton, deuteron, and He-3 activation. Trace analysis methods were studied using the following nuclear reactions: Pb-206, 207 (p, xn)Bi-206, Pb-206, 207 (d, xn) Bi-206, Pb-206, 207, 208 (He-3, xn) Po-207, and Pb-206, 207 (alpha, xn) Po 207. In addition, a rapid, nondestructive technique based on the reaction Pb-206 (d, p) Pb-207m (t 1/2 = 800 msec) was evaluated and proton and deuteron activation were further examined for measuring Pb-204/Pb-206 ratios. Activation curves were determined for the reactions investigated and results of destructive and nondestructive determinations are presented. The detection limits were estimated at 0.01 ppm for proton and deuteron activation and at 0.1 and 0.2 ppm for He-3 and He-4 activation respectively. (Jernigan-Vanderbilt)

POTENTIOMETRIC MEASUREMENT OF COPPER IN SEAWATER WITH ION 1 = 1 SELECTIVE ELECTRODES,
Texas Instruments, Inc., Dallas.
R. Jasinski, I. Trachtenberg, and D. Andrychuk.
Analytical Chemistry, Vol 46, No 3, p 364-369, March, 1974. 6 fig, 4 tab, 18 ref.

Descriptors: *Copper, *Seawater, *Analytical techniques, *Potentiometers, Inorganic compounds, Organic compounds, On-site data collections, Electrochemistry, *Pollutant identification.

The data reported confirm that, with proper precautions in sample handling and measurement, the ionic cupric copper concentration of seawater can be monitored with ion-selective electrodes. The measured cupric ion content is identical to the total soluble cupric copper content when the electrode response is calibrated directly in seawater, to account for the inorganic complex ion distribution; when organic chelating agents with high stability constants relative to cupric ion are absent; and when the proper Nernstian slope is used in calculation. At and below 1 ppb copper, account must be taken of the injection of soluble copper (or silver) into solution by the sensor electrode. Seawater samples from three different sources were studied. The analysis of an open ocean water was straightforward. However, analysis of the near shore waters showed abnormalities which can be explained by the presence of small quantities of chelating agents. (Jernigan-Vanderbilt)

SPECTROCHEMICAL METHOD FOR THE DETERMINATION OF 36 ELEMENTS IN INDUSTRIAL EFFLUENT,
Engelhard Industries, East Newark, N.J. Instrumental Analysis Lab.
V. M. LeRoy, and A. J. Lincoln.
Analytical Chemistry, Vol 46, No 3, p 369-373, March, 1974. 6 tab, 1 fig, 20 ref.

Descriptors: *Trace elements, *Analytical techniques, *Spectroscopy, *Industrial wastes, Chemistry, Pollutants, Sampling, Standards, Testing procedures, Iron, Tin, Nickel, Manganese, Chromium, Copper, Zinc, Aluminum, Silver, Gold, Molybdenum, Lead, Cadmium, Calcium, Magnesium, Mercury, Cobalt, *Pollutant identification.

A quantitative spectrochemical method is described for the determination of 36 elements in industrial effluent with limits of element sensitivities for the analytical curves in the 0.0005-0.1 mg/100 ml range. One set of analytical curves was used for all samples. The samples were weighed salt residues obtained through evaporation to dryness at 120C. Any sample volume can be used. Matrix effects were significantly reduced by combining total energy burns in an argon-oxygen atmosphere with 1:6 salt to high purity graphite powder dilutions. Germanium dioxide, added to the graphite powder was the internal standard. Conditions of analysis, salt weight ratios, preparation of standards, precision, and accuracy are discussed. (Jernigan-Vanderbilt)

THE VANADIUM AND SELECTED METAL CONTENTS OF SOME ASCIDIANS,
California Univ., Davis. Dept. of Chemistry.
J. H. Swinehart, W. R. Biggs, D. J. Halko, and N. C. Schroeder.
Biological Bulletin, Vol 46, p 302-312, April, 1974. 2 fig, 1 tab. ACS(PRF-6686-AC3).

Descriptors: *Heavy metals, *Aquatic life, *Seawater, Analytical techniques, Spectroscopy, Testing procedures, Iron, *California, Pollutant identification.
Identifiers: *Vanadium, *Ascidians.

The vanadium and other selected transition metal contents of ascidians primarily from the northern California coast are reported. It has been suggested that the ability to concentrate vanadium to levels greater than the combined levels of other transition metals is confined to certain families in the order Phlebobranchia, but several workers have reported finding substantial concentrations of vanadium in species from the order Aplousobranchia. Studies were carried out on certain species of these orders to determine vanadium content. Observations were made on a species from the order of Stolidobranchia to determine iron content. The species Ascidia ceratodes and Perophora annectens had large vanadium contents as has been predicted for members of the families Ascidiidae and Perophoridae from the order Phlebobranchia. Several species in the order Aplousobranchia have large vanadium contents: the vanadium being present as vanadium (IV) whereas it is vanadium (III) that is found in order Phlebobranchia. Molgula manhattensis, a species from the order Stolidobranchia, shows a large iron content: the metal being localized in the fluid from the heart. Three dominant fractions were chromatographed from the cells contained in the fluid of Ascidia ceratodes. The spectra of these fractions were correlated with the spectrum of the cells. (Jernigan-Vanderbilt)

TRACE METAL ANALYSIS IN WATER BY PROTON-INDUCED X-RAY EMISSION ANALYSIS OF ION-EXCHANGE MEMBRANES,
Duke Univ., Durham, N.C. Paul M. Gross Chemical Lab.
C. H. Lochmuller, J. W. Galbraith, and R. L. Walter.
Analytical Chemistry, Vol 46, No 3, p 440-442, March, 1974. 6 fig, 1 tab, 11 ref.

Descriptors: *Trace elements, *Analytical techniques, *Sampling, Water, X-rays, Ion-exchange, Spectroscopy, Testing procedures, Lead, Mercury, Cadmium, *Pollutant identification.
Identifiers: *X-ray emission analysis.

A simple technique has been developed which provides a rapid, semiquantitative screening method for most metals found in water systems without laborious and exacting preconcentration and chemical techniques. The method involves the use of proton-induced X-ray emission analysis. A target to be analyzed is placed in the path of a beam of protons produced by an accelerator. The atoms of the target are thus excited and emit characteristic X-rays which are captured by a solid state detector. A pulse-height analyzer is used to count the X-rays and an energy spectrum is obtained. Advantages over conventional X-ray fluorescence spectroscopy include lack of interference from bremsstrahlung or 'white radiation' and larger X-ray production cross section. Metals are absorbed by an ion exchange membrane, saving time ordinarily needed to evaporate large volume samples. Prepared solutions, tap water, river water and milk were tested. (Jernigan-Vanderbilt)
W74-11355

DETERMINATION OF TOTAL MERCURY IN AIR BY CHARCOAL ADSORPTION AND ULTRAVIOLET SPECTROPHOTOMETRY,
National Environmental Research Center, Research Triangle Park, N.C. Quality Assurance and Environmental Monitoring Lab.
F. P. Scaringelli, J. C. Puzak, B. I. Bennett, and R. L. Denny.
Analytical Chemistry, Vol 46, No 2, p 278-283, February, 1974. 8 fig, 5 tab, 18 ref.

Descriptors: *Mercury, *Air pollution, *Analytical techniques, Spectroscopy, Sampling, Silver, Inorganic compounds, Activated carbon, *Spectrophotometry, *Pollutant identification.

A simple inexpensive method is described for determining concentrations of total mercury in the atmosphere. Mercury and its compounds were effectively collected by passing ambient air through activated charcoal contained in Vycor tubes. The charcoal tubes were prepared by heating under nitrogen to activate the charcoal and to remove impurities. Immediately after cleaning, the tubes were sealed with ball joints until ready for sample collection to prevent contamination. After sampling, the tubes were resealed for transport to the laboratory where they became an integral part of the analytical gas train. The mercury and its compounds were vaporized by heating under a stream of nitrogen and carried to a thermal reactor, which converted the compounds to the elemental state. Elemental mercury then amalgamated on silver, allowing potential interferences to pass through the absorption cell. The silver amalgam was heated to 300C to give absorption peaks in the ultraviolet at 253.7 nm that were sharp and reproducible. The method was tested with simulated and real atmospheres under field conditions. Precision and accuracy of the method was greater than 95% within the range of 0.15 to 1.5 micrograms/cu m. Outside this range, the error would be greater; however, the dynamic range may be shifted upward or downward by changing sampling rates, sample times, or cell path and by combination of these variables. (Jernigan-Vanderbilt)
W74-11363

APPLICATION OF CHELATING ION EXCHANGE RESINS FOR TRACE ELEMENT ANALYSIS OF GEOLOGICAL SAMPLES USING X-RAY FLUORESCENCE,
Georgia Univ., Athens. Dept. of Geology.
C. W. Blount, D. E. Leyden, T. L. Thomas, and S. M. Guill.
Analytical Chemistry, Vol 45, No 7, p 1045-1050, June, 1973. 2 fig, 3 tab, 20 ref. NSF GP-24311.

Descriptors: *Trace elements, *Resins, *X-ray fluorescence, *Separation techniques, Analytical techniques, *Chelation, *Ion exchange, *Pollutant identification.

The use of chelating ion exchange resins for the quantitative batch extraction of ions of trace elements and as a matrix for the determination of the elements using X-ray fluorescence is described. Chelex-100, an ion exchange resin containing iminodiacetic acid functional groups, was used for the determination of cobalt and nickel in U.S. Geological Survey samples. The selective extraction of bismuth was achieved by pH control, and bismuth was determined in several geochemical standard samples, NMRR, a chelating resin highly selective for gold and platinum metals, was used for the specific extraction of gold. In all cases, the determination was performed by pressing the resin into pellets and using these pellets as samples for X-ray fluorescence. Samples containing as little as 0.04 ppm gold, 0.2 ppm bismuth, and 15 ppm cobalt or nickel were analyzed. (Jernigan-Vanderbilt)
W74-11364

SOLVENT EXTRACTION FOR THE SEPARATION OF METALS,
Rutgers The State Univ., New Brunswick, N. J.
S. A. Katz.
American Laboratory, p 19, 10, 22, 23, October, 1972. 1 tab, 19 ref.

Descriptors: *Separation techniques, *Solvent extractions, *Analytical techniques, *Trace elements, Heavy metals, Testing procedures, Aqueous solutions, Thermodynamics, *Pollutant identification.
Identifiers: Metal ions.

Solvent extraction provides a rapid and conventional approach to the separation and isolation of metal ions from complex mixtures. Prior to separation and subsequent quantitative determinations, the sample containing the metal ions is most frequently encountered as an aqueous solution, therefore, it should be understood that solvent extraction implies the presence of an aqueous solvent/organic solvent pair. In extraction systems, some or all of the water molecules coordinated to the metal ion must be removed before it is possible to obtain a species that can be extracted into an organic solvent. There appear to be three aspects common to all extraction procedures: (1) the formation of an extractable species, (2) the distribution of the extractable species between the initial aqueous phase and the extracting organic phase, and (3) interactions of the extracted species in the organic phase. The formation of an uncharged species is probably a prerequisite for the extraction of metal ions into organic solvents. Such species may be formed by metal-containing ions through coordination. In addition, an uncharged, extractable species may be achieved through the neutralization of a charge. (Jernigan-Vanderbilt)
W74-11365

THE DETERMINATION OF TRACE QUANTITIES OF MOLYBDENUM BY ATOMIC ABSORPTION SPECTROSCOPY,
National Physical Research Lab., Pretoria (South Africa).
L. R. P. Butler, and P. M. Mathews.
Analytica Chimica Acta, Vol 36, p 319-327, 1966. 3 fig, 8 tab, 10 ref.

Descriptors: *Molybdenum, *Spectroscopy, Analytical techniques, Testing procedures, Laboratory tests, Trace elements, Springs, Rivers, *Pollutant identification.
Identifiers: *Atomic absorption spectroscopy.

A procedure is described for the determination of trace quantities of molybdenum by atomic absorption spectroscopy. Molybdenum was complexed with ammonium pyrollidine dithiocarbamate or 8-hydroxyquinoline and extracted into n-amylmethyl ketone. Molybdenum was then determined by atomic absorption spectroscopy. Interferences were eliminated and detection limits of 0.002ppm for water samples, 0.1ppm for samples of dried plant material, and 1.0ppm for silicate rock samples were obtained. The limit of detection for both the dried plant material and the rock samples could have been improved by increasing the initial weight sample. The methods developed appear to be satisfactory from the point of view of accuracy and precision. Although the chemical steps are time-consuming, many samples can be analyzed daily. The method appears to be at least as rapid and accurate as any other method in use. (Jernigan-Vanderbilt)
W74-11371

INSTRUMENTAL NEUTRON ACTIVATION ANALYSIS OF LEAD MATRICES FOR MERCURY,
California Univ., Irvine.
W. P. Guinn, and K. Heydorn.
Transactions of the American Nuclear Society, Vol 15, p 70, 1972. 2 ref.

Descriptors: *Mercury, *Lead, *Neutron activation analysis, Analytical techniques, Pollutant identification.
Identifiers: *Interferences.

When specimens of various kinds of materials are analyzed for mercury by neutron activation analysis, for all but extremely long irradiations, the sensitivity attainable via the Hg 197-induced activity is appreciably better than that attainable via the Hg 203-induced activity. Because of the low energies of the Hg 197 emissions, workers using NaI (T1) gamma-ray spectrometry have usually preferred to utilize the higher energy gamma-ray (279.1 KeV) of Hg 203. Now, with the wide availability of large high-resolution Ge(Li)detectors, it is generally preferable to measure the Hg 197 activity instead. Use of the Hg 203 activity in the analysis of lead-rich matrices can lead to erroneous results due to the emission of photons of the same energy by Pb 203 and by Hg 203. An example of misidentification is the case of measuring the mercury content in automobile exhaust solids when it was apparently actually lead that was being measured. The difference in half lives of Pb 203 and Hg 203 activity allows differentiation of the elements even with an NaI (T1) detector. (Jernigan-Vanderbilt)

ION-EXCHANGE PAPER CHROMATOGRAPHY OF METAL IONS WITH MIXED AQUEOUS-ORGANIC SOLVENTS CONTAINING MINERAL ACID AND A SELECTIVE EXTRACTANT,
Lafayette Coll., Easton, Pa. Dept. of Chemistry.
J. Sherma, and F. J. VanLenten.
Separation Science, Vol 6, No 2, p 199-206, April, 1971. 17 ref.

Descriptors: *Chromatography, *Ion exchange, Aqueous solutions, *Metals, *Solvent extractions, Analytical techniques, Separation techniques, Chemical reactions, Organic compounds, Scandium, Nickel, Cations, Anions, Laboratory tests, *Pollutant identification.
Identifiers: *Metal ions.

An ion exchange chromatography method has been used for numerous useful separations. The results of ion-exchange with papers are often the same as those achieved with column systems employing the same mobile phase and a similar resin. Mixed solvents containing an organic extractant provide selective separations of metal ions on cation-and anion-exchange papers. The separations of scandium, hafnium plus zirconium, nickel and thorium from complex mixtures has been demonstrated. Various separations in dithizone and dimethyl sulfoxide media are also reported. As a general rule, ions with very high distribution coefficients (greater than 1000) will remain at the origin during paper chromatography, while ions with coefficients below 1 will migrate. (Jerome-Vanderbilt)
W74-11374

LEAD-POISONING DETECTOR.
HSMHA Health Reports, Vol 86, No 7, p 652, July, 1971. 1 photo.

Descriptors: *Lead, *Analytical techniques, *Public health, *Instrumentation, Pollutants, Metals, Enzymes, Testing procedures, Toxins, On-site data collections, *Pollutant identification.

An ultra-sensitive, portable instrument for detecting lead poisoning in people, called the microporph, has been developed. The portable unit can be operated on house current by personnel with minimum training and requires only 30-40 microliters of blood for analysis. The test is for protoporphyrin rather than lead itself. The instrument can easily handle two tests per minute and is sufficiently sensitive to detect normal as well as abnormal protoporphyrin levels in the blood. Thus, any degree of lead poisoning may be detected. (Jerome-Vanderbilt)
W74-11377

MERCURY DETERMINATIONS IN NATURAL WATERS BY PERSULFATE OXIDATION,
Georgia Univ., Athens. Dept. of Zoology.
J. J. Alberts, J. F. Schindler, R. W. Miller, and P. W. Carr.
Analytical Chemistry, Vol 46, No 3, p 434-437, March, 1974. 3 fig, 2 tab, 9 ref.

Descriptors: *Mercury, *Aqueous solutions, *Analytical procedures, *Reduction(Chemical), Oxidation, Organic compounds, Testing procedures, Instrumentation, Sampling, *Pollutant identification, Sampling.
Identifiers: Sample preparation, *Atomic absorption spectroscopy.

A procedure is described for determining mercury at the parts-per-billion (ppb) level in aqueous solution which uses an open analysis system, requires small sample volume, is easily handled in the field and during transportation, has little loss of mercury during storage, allows oxidation at elevated temperatures, has improved analysis time, and ensures that the sample is sealed until opened in the analysis system, thereby releasing all of the mercury present as the metallic vapor. The method is an adaptation of the Menzel and Vaccaro ampoule method for determination of dissolved organic matter in natural waters, involving the oxidation of organic matter by persulfate in an ampoule sealed under nitrogen and heated to 120C. (Jernigan-Vanderbilt)
W74-11378

MERCURY CONTENT IN FEATHERS OF SWEDISH BIRDS FROM THE PAST 100 YEARS,
Museum of Natural History, Stockholm (Sweden).
W. Berg, A. Johnels, B. Sjostrand, and T. Westermark.
Oikos, Vol 17, No 1, p 71-83, 1966, 12 fig, 12 tab, 17 ref.

Descriptors: *Path of pollutants, *Birds, *Mercury, *Food chain, Water pollution, Pollutants, Temporal distribution, Analytical techniques, *Neutron activation analysis, Measurements, Sampling, Data collections, Evaluation, Laboratory tests, *Pollutant identification.

The mercury content in feathers in ten species of birds was determined by activation analysis. Using material drawn from skins and mounted specimens and from living or freshly killed birds, the study covered a period of more than the past hundred years. The possibility of post mortem contamination is discussed and allowances have been made for such cases. Roughly constant Hg levels were encountered in each of the investigated species during the period 1840-1940, although there was considerable variation between species. Differences in position within the food chain seem to account for such differences between species. A well documented increase of Hg concentration, amounting to a least 10 to 20 times the previous level appeared in specimens from the 1940's and 1950's. This appearance of increased mercury accumulations in birds mainly in the early 1940's indicates that alkyl-Hg compounds used as seed dressings were chiefly responsible for the increase. (Jerome-Vanderbilt)
W74-11382

DETERMINATION OF LEAD, URANIUM, THORIUM, AND THALLIUM IN SILICATE GLASS STANDARD MATERIALS BY ISOTOPE DILUTION MASS SPECTROMETRY,
National Bureau of Standards, Washington, D.C. Analytical Chemistry Div.
I. L. Barnes, E. L. Garner, J. W. Gramlich, L. J. Moore, and T. J. Murphy.

Analytical Chemistry, Vol 45, No 6, p 880-885, May, 1973. 1 tab, 4 fig, 11 ref.

Descriptors: *Mass spectrometry, Isotope studies, *Lead, Analytical techniques, *Silicates, Standards, Materials testing, *Pollutant identification.
Identifiers: *Thorium, *Thallium, *Uranium.

One of the first materials to be selected for standard materials for trace element analysis was a silicate matrix containing many elements at a series of graded concentration levels. These were prepared by the Corning Glass Works. A set of four standard glass wafers were prepared which had been doped with 61 different elements at the 500, 50, 1, and 0.02ppm level. The concentrations of lead, uranium, thorium, and thallium were determined by isotope dilution mass spectrometry at a number of points in each of the glasses. The results obtained from independent determinations in two laboratories demonstrated the homegeneity of the samples and that precision of the order of 0.5% (95% L.E.) may be obtained by the method even at the 20ppb level, for these elements. The chemical and mass spectrometric procedures are presented. (Jernigan-Vanderbilt)

Analytical Chemistry, Vol 46, No 3, p 445-446, March 1974. 2 tab, 4 fig.

Descriptors: *Mercury, *Analytical techniques, *Burning, Tracers, Inorganic compounds, Organic compounds, Spectrocopy, Testing procedures, Instrumentation, Organic matter, Radioisotopes, *Pollutant identification.
Identifiers: *Methylmercury, Sample preparation, *Atomic absorption spectroscopy.

Using flameless atomic absorption, oxidation of the sample containing inorganic and/or organic mercury was conducted in an oxygen-filled bomb. Using this technique and utilizing a radiotracer of mercury to quantitate any losses during the oxidation, an accurate method was developed to determine environmental levels of mercury in combustible samples. The method was tested by determining the recovery of both stable and radioactive mercury, added in either an organic or inorganic form from vegetation samples. Mercuric chloride and organic mercury were added to alfalfa samples, resulting in recoveries from 78 to 90%. If the amount of organic mercury is desired distinct from the total mercury content, a separation of organic from inorganic fractions should be performed before combustion in the bomb. TRACE DETERMINATION OF BERYLLIUM OXIDE IN BIOLOGICAL SAMPLES BY ELECTRON-CAPTURE GAS CHROMATOGRAPHY,
Aerospace Medical Research Lab., Wright-Patterson AFB, Ohio.
G. M. Frame, R. E. Ford, W. G. Scribner, and T. Ctvrtnicek.
Analytical Chemistry, Vol 46, No 4, p 534-539, April, 1974. 4 tab, 14 ref.

Descriptors: *Beryllium, *Oxides, *Organic matter, *Gas chromatography, Analytical techniques, Laboratory tests, Testing procedures, Animal physiology, Rodents, Mammals, Pollutant identification.

Two preparations of beryllium oxide labeled with Be7 were synthesized by calcining at 500 or 1600C. Comparative radiochemical and gas chromatographic analyses of these oxides were made using two procedures. Direct dissolution-chelation of the oxides with concentrated trifluoroacetylacetone in ampoules followed by electron-capture gas chromatography of the resultant beryllium chelate suffered from interference by a trifluoroacetylacetone reaction product. A second method employed the dissolution of the oxides in dog blood and rat liver homogenate media by a hot 75% sodium hydroxide procedure. The beryllium from the dissolved oxide was then chelated by a low temperature reaction with trifluoroacetylacetone without forming an interfering product. Subsequent gas chromatographic analysis yielded recoveries averaging 105%; standard deviation= plus or minus 7%. The samples tested were limited to the 1.0mg Be0/ml level by radioactivity, but the gas chromatographic base-line noise level was now enough to permit analyses of submicrogram quantities. ANALYSIS OF ORGANIC MERCURY COMPOUNDS BY GAS CHROMATOGRAPHY,
Kobe Univ. (Japan). Dept. of Public Health.
K. Sumino.
Kobe Journal of Medical Science, Vol 14, p 115-148, June, 1968, 12 fig, 14 tab, 19 ref.

Descriptors: *Mercury, *Analytical techniques, *Gas chromatography, *Separation techniques, *Water pollution sources, Metals, Heavy metals, Pesticides, Human pathology, Calibrations, *Pollutant identification.
Identifiers: *Extraction, *Isolation, *Methylmercury.

Ultratrace determinations of alkyl and phenyl mercury using a gas chromatograph with an electron capture detector have been performed. A detection limit for methyl mercury chloride of 10 to the-12 th power and for phenyl mercury chloride of 10 to the -11th power was reached. Isolation of organic mercury from different materials was performed by separation of organic mercury combined with SH radical into 1N-HC1 solution. The solution was then extracted with benzene, and this benzene solution re-extracted with aqueous glutathione. After acidification of the resulting solution with HC1, final extraction with benzene was performed. This cleanup method was employed in the identification of organic mercury and was a very useful technique for its extraction. Materials related to Minamata Disease were analyzed and found to contain high concentrations of methylmercury. An attempt to trace Minamata Disease in Niigata Prefecture led to the following conclusions: (1) Methylmercury was detected in water moss only in the area around a drainage outlet of an acetaldehyde factor; (2) Methylmercury is a by-product in acetaldehyde production; (3) Waste discharge from the factory caused Minamata Disease in experimental animals. DESIGN AND EVALUATION OF A VIDICON SCANNING SPECTROMETER FOR MOLECULAR ABSORPTION AND ATOMIC EMISSION SPECTROMETRY,
Purdue Univ., Lafayette, Ind. Dept. of Chemistry.
M. J. Milano, H. L. Pardue, T. E. Cook, R. E. Santini, and D. W. Margerum.
Analytical Chemistry, Vol 46, No 3, p 374-381, March, 1974 8 fig, 2 tab, 13 ref. AFOSR(71-1588) and PHS(GM 13326-07).

Descriptors: *Measurement, *Spectroscopy, *Analytical techniques, *Instrumentation, *Metals, Testing procedures, Calcium, Iron, Copper, Salts, *Pollutant identification.
Identifiers: *Atomic absorption spectroscopy.

A silicon target vidicon tube is used for scanning spectrometry in the visible region at speeds ranging from less than 0.1Hz up to 250Hz. The spectrometer is interfaced to a digital computer for on-line collection and processing of data. Dynamic range data taken over four orders of magnitude yield a gamma function of 0.998 plus or minus 0.005 for the tube. Quantitative data are reported for kinetic studies using molecular absorption spectrometry and simultaneous multielement analyses in synthetic solutions using flame emission spectrometry. Chemical data included demonstrate that absorbance data are reliable to at least 0.002 absorbance unit at a scan rate of 250Hz. Flame emission data are linear between 0.25 and 10ppm for sodium, potassium and lithium and between 1 and 100ppm for calcium. Standard deviations for repetitive runs on the alkali metals range from a low of 0.01ppm for 0.25ppm lithium to a high of 0.12ppm for 10ppm sodium. (Jernigan-Vanderbilt)

FILTER PORE-SIZE EFFECTS ON THE ANALYSIS OF AL, FE, MN, AND TI IN WATER,
Geological Survey, Menlo Park, Calif.
V. C. Kennedy, and G. W. Zellweger.
Water Resources Research, Vol 10, No 4, p 785-790, August 1974. 1 fig, 2 tab, 24 ref.

Descriptors: *Water analysis, *Filtration, *Clay minerals, *Analytical techniques, Separation techniques, Spectroscopy, *Aluminum, *Iron, *Titanium, *Manganese, Adsorption, Particle size, Clays, Pollutant identification.

Fine-grained particulate material can pass through 0.45-micrometer membrane filters and cause large percentage errors in analyses of those elements that are enriched in the particulates and have a very low concentration in solution in natural waters; Al, Fe, Ti, and, to a lesser extent, Mn are examples. Hence in making thermodynamic equilibrium calculations for these elements, considerable caution is necessary in using analyses from water samples passed through filters with pore sizes larger than 0.1 micrometer. Compared with 0.45 micrometer filters the 0.1 micrometer filters significantly reduce passage of particulates without increasing filtration time to an unreasonable degree. If the common procedure of filtration through a membrane filter followed by acidification is used, the concentration of dissolved Al, Fe, and Mn determined in the filtrate will vary with the degree of filter clogging, pH after acidification, and the time of standing before analysis. When a spectrographic analysis of a water residue, which can be quite sensitive for Ti, is made, the presence of Ti concentrations significantly exceeding 1 microgram per liter should be a warning that clay minerals may have passed through the filter. (Knapp-USGS)

COMPARISON OF OBSERVED AND CALCULATED CONCENTRATIONS OF DISSOLVED AL AND FE IN STREAM WATER,
Geological Survey, Reston, Va.
B. F. Jones, V. C. Kennedy, and G. W. Zellweger.
Water Resources Research, Vol 10, No 4, p 791-793, August 1974. 3 tab, 26 ref.

Descriptors: *Water chemistry, *Water analysis, *Chelation, *Organic matter, *California, Analytical techniques, Aluminum, Iron, Mineralogy, Equilibrium, Leaching, Weathering, *Pollutant identification.

Measured concentrations of dissolved Al and Fe in streamflow samples treated to avoid particulate contamination can compare favorably with concentrations calculated from data on mineral stability and inorganic complexing. Significant differences are probably related to storm runoff or organic complexing. Waters from several northern California streams, analyzed in conjunction with special techniques to exclude particulate contamination, contained dissolved Al and Fe in the ranges 1-3 and 0.3-8.8 micrograms/l respectively,

for samples collected during low-flow periods. A moderate flow sample from the Mattole River, in an area of 90-100in of rainfall per year, gave an Al concentration of 10 micrograms/l and an Fe concentration of about 0.3 microgram/l. Comparison of these concentrations for dissolved Al and Fe with those calculated from stability constants for common mineral phases with provision for inorganic complexing shows them to be generally in reasonable agreement. Higher than expected values of Al were associated with storm runoff, and abnormally high Fe was found in streams with highly organic sediment. (Knapp-USGS)

DETERMINATION OF TRACE METALS IN SODIUM DITHIONITE-CITRATE EXTRACTS OF SOILS AND SEDIMENTS BY ATOMIC ABSORPTION,
Geological Survey, Menlo Park, Calif. Water Resources Div.
E. A. Jenne, J. W. Ball, and C. Simpson.
Journal of Environmental Quality, Vol 3, No 3, p 281-287, July-September 1974. 2 fig, 4 tab, 32 ref.

Descriptors: *Trace elements, *Soils, *Sediments, *Chemical analysis, *Flame photometry, Solvent extractions, Analytical techniques, Cobalt, Copper, Nickel, Molybdenum, Zinc, Iron, Trace elements, *Pollutant identification.
Identifiers: *Atomic absorption photometry.

A general method was developed for the analysis of Co, Cu, Ni, Mo, and Zn in dithionite-citrate extracts of soils and sediments. Because of the high Zn content of dithionite, it is necessary to preclean the dithionite-citrate solution before it is used to extract soils or sediments. This precleaning lowers the detection level significantly for other trace elements as well. Since Fe causes flame interferences in atomic absorption, the size of the individual sample aliquot taken to chelation-solvent concentration is varied to provide a constant quantity of Fe (5ng). The standards and blanks are adjusted to the same Fe content. This approach is necessitated by the wide differences in the Fe concentrations of the dithionite-citrate extracts. Following pH adjustments and addition of ammonium-1-pyrrolidine dithiocarbamate, the trace metals (and Fe) are concentrated via two successive 10ml methyl isobutyl ketone extractions. Quantities of Fe much greater than 5ng interfere in the solvent concentration step. Natural organics released by the dissolution of free-Fe and -Mn oxides, to the extent that they are represented by fulvic acids, do not cause any significant interference. (Knapp-USGS)

A STUDY OF OIL SOURCE IDENTIFICATION TECHNIQUES,
Coast Guard, Washington, D.C. Office of Research and Development.
L. Melamed.
Available from NTIS, Springfield, Va., 22161 as AD-761 971, Price $4.50 printed copy; $2.25 microfiche. Environmental and Transportation Technology Division Report, September 1972. 59 p, 7 fig, 1 tab, 25 ref, append.

Descriptors: *Oil pollution, *Oil spills, *Pollutant identification, Path of pollutants, Tracking techniques, Tagging, Marking techniques, Tracers.

Techniques for the identification of the sources of oil slicks include both passive (fingerprint) and active tagging. Passive techniques are easy to implement but offer a fragile forensic foundation; conversely, active techniques can provide excellent courtroom evidence but are beset by problems of system implementation. Active tagging is recommended for research. Organic phosphors and halogenated polycyclic aromatics are possible tags for field use. (Knapp-USGS)

THE DETERMINATION OF MERCURY IN COMMERCIALLY IMPORTANT AQUATIC ORGANISMS,
Omni Research, Inc., Mayaguez, Puerto Rico. Caribbean Research Labs.
R. Y. Ting.
Available from NTIS, Springfield, Va., 22161 as COM-73-11125, Price $4.25 printed copy; $2.25 microfiche. Project Completion Report to NOAA, National Marine Fisheries Service, October 1972. 43 p, 1 fig, 3 tab, 5 ref.

Descriptors: *Mercury, *Fish, *Puerto Rico, Heavy metals, Poisons, Trace elements, Public health, *Pollutant identification.

Mercury in the flesh of the majority of fish and invertebrates commonly taken for consumption in Puerto Rico was below the maximum permissible level set by FDA (0.5ppm). However, the flesh of larger pelagic carnivorous fish including barracuda, blue marlin, and kingfish often exceeded the 0.5ppm level. Herbivorous fish, in general, contain less mercury than carnivorous fish of comparable weight. (Knapp-USGS)

LOCALIZED THERMAL POLLUTION IN SHALLOW STREAMS, (NEAR-FIELD TEMPERATURE DISTRIBUTIONS),
Kansas Univ., Lawrence. Water Resources Research Inst.
Y-S. Yu.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-234 632, $3.75 in paper copy, $2.25 in microfiche. Contribution No 133, September 1973. 53 p, 18 fig, 3 tab, 6 ref. OWRR A-040-KAN(1). 14-31-0001-3516.

Descriptors: *Thermal pollution, *Heated water, *Temperature distribution, Velocity, Water temperature, Dilution, Heat flow, Distribution patterns.
Identifiers: *Dilution factor, *Heat flow ratio, Shallow streams, *Thermal plumes, Heated discharge.

Temperature rise in the near field of a heated discharge into a relatively wide and shallow stream has been determined in a laboratory channel. The experimental results show that the region in which the maximum temperature rise in each section of the stream exceeds 5 degrees F, is limited to a distance no larger than 32 bo (bo = width of channel for the heated discharge) downstream from the entry of heated water. The maximum width of the thermal plume in this critical region is less than four-fifths of the width of the stream flow. The maximum temperature rise near the water surface decays linearly with the distance measured along the stream on a log-log plot. An empirical equation for the position of the axis of the thermal plume is obtained. The width of spread measured from the axis to the stream-side boundary of the thermal plume is proportional to the distance. The dilution factor and heat flow ratio at four different sections in the thermal plume have also been determined. The maximum heat loss in this region is less than 8% of the original heat flow in the heated water. The effects of the five key dimensionless parameters, namely, U/V, Th/Ta, Fo, dh/bo, and a on the dilution factor are discussed. The presence of a weir at the entry of the heated discharge results in an extended region of temperature inversion due to the spreading of heated water along the channel bottom. The results of this study can be used as a first approximation to estimate the size of thermal plume and the decay of maximum temperature rise in the near field in relatively shallow and wide stream.

THE EFFECT OF HYDROMETEOROLOGICAL CONDITIONS ON THE ZETA-POTENTIAL OF SUSPENDED SOLIDS (HIDROMETEOROLOGIAI VISZONYOK HATASA A LEBEGO ANYAGOK ZETA-POTENCIALJARA),
L. Bulkai, I. Licsko, and L. Szepkuti.
Hidrologiai Kozlony, No 12, p 557-565, 1973. 6 fig, 4 tab, 2 ref. English summary.

Descriptors: *Zeta potential, *Suspended solids, Rivers, *Hydrometeorology, Electric properties, Conductivity, Water level, Seasonal, Temperature, Algae.
Identifiers: *Danube River, Electrostatic charges, River stages.

The effect of hydrometeorological conditions on the zeta potential of suspended solids was investigated in the Danube River. The colloidal particles had a negative charge and almost every particle within a sample had a different zeta potential. Therefore, it was impossible to describe a particular hydrometeorological situation positively and unambiguously by a single zeta potential value. An attempt was subsequently made to describe the electrostatic charges of the colloidal particles present by the distribution of the zeta potential values observed. The observation data were processed with the help of a computer, but there was no correlation between either the suspended solids content and zeta potential or between conductivity and zeta potential. There was a relationship of limited validity between the number of algae counted in unit volume and the value of the zeta potential. At an increasing alga count the zeta potential tended to zero, whereas decreasing counts were accompanied by increasing zeta potential values. A relationship of similarly limited, but more general validity was found to exist between river stage and the zeta potential. (Merritt-FIRL)

NOTE ON LITHIUM IN SALINE GROUNDWATERS,
Central Soil Salinity Research Inst., Karnal (India).
I. C. Gupta.
Indian J Agric Sci. Vol 42, No 7, p 650-651. 1972.
Identifiers: *Electrical conductivity, Groundwater, Irrigation, *Lithium, *Saline groundwater, Toxicity, *India(Uttar Pradesh).

Ground water samples from Mathura, Uttar Pradesh, India, were analyzed for Li. The irrigation waters were classified on the basis of electrical conductivity (micromhos/cm at 25 degrees C) as C1 (0-250); C2(250-750); C3 (750-2250); C4 (2250-4000); C5 (4000-6000) and C6 (> 6000). Out of 35 samples 6 belonged to C3 class, 3 to C4 class, 9 to C5 and the rest to C6 class. All waters contained Li, the lowest concentration being 0.02 ppm

and the highest, 1.35 ppm. The waters of C3 and C4 class contained Li in safe limit (0.05 ppm or less). The average Li content of C5 class waters was 0.06 ppm, which is higher than permissible concentrations. In waters of class C6 the average Li content was 0.35 ppm, considered to be very toxic. Ground waters of high salinity contain higher concentrations of Li. The waters with electrical conductivity of 4000 micromhos/cm at 25 degrees C or less are less susceptible to toxic concentrations of Li; waters of C6 may contain Li in amounts that may be toxic to crops.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF NITROGEN AND PHOSPHORUS AT TWO MOISTURE LEVELS ON THE STATUS OF THE AVAILABLE ZN, CU, MN AND FE IN THE SOIL,
Punjab Agricultural Univ., Ludhiana (India). Dept. of Soils.
G. Dev, and M. S. Mann.
J Res Punjab Agric Univ. Vol 9, No 2, p 277-281. 1972.
Identifiers: Ammonium sulfate, Copper, Iron, Manganese, *Nitrogen, *Phosphorus, *Soil moisture, Zinc, Hydrogen ion concentration, Loam, *Metals.

Incubation studies in the laboratory were conducted on a loamy-sand soil to study the effect of 3 levels of N (0, 200 and 400 kg N/ha) and 3 levels of P (0, 100 and 200 kg P2O5/ha) alone and in combination at 2 moisture levels (30 and 60% of the saturation percentage). Increasing doses of N, as (NH4)2SO4, decreased the soil pH and increased the status of available Zn and Mn significantly. Increase in the level of P application significantly decreased the status of available Zn and Fe. There was no significant effect of moisture levels, neither was there any significant interaction between any of the 3 factors tested.--Copyright 1973, Biological Abstracts, Inc.

METHYLATION OF MERCURY IN LAKE AND RIVER SEDIMENTS DURING FIELD AND LABORATORY INVESTIGATIONS,
Wisconsin Univ., Madison.
L. W. Jacobs.
Available from University Microfilms, 300 No. Zeeb Rd., Ann Arbor, Mich., 48106 (Order No. 73-23,067). Ph D Dissertation, 1973. 107 p.

Descriptors: *Mercury, *Methane, Pollution, Rivers, Lakes, Onsite investigation, Anaerobic conditions, Aerobic conditions, Absorption, Ecology, Laboratory tests, Sedimentation, Water pollution sources, *Pollutant identification, Oligotrophy, Eutrophication, Lake sediments.
Identifiers: Methylation, *Methyl-mercury, Aqua regia, Atomic absorption spectrophotometry.

The objectives were to determine the amount of methyl-mercury (MeHg) that is produced in the sediments of two contrasting river environments when these sediments were treated with mercuric or phenylmercuric salts, and to determine the amount of MeHg formed in dissimilar lake and river sediments and the characteristics which affect the production and accumulation of MeHg. On-site experimentation was performed at two river sites by sample retrieval of bulk sediment. These samples were analyzed for total Hg using an aqua regia digest and flameless atomic absorption spectrophotometry. Results indicate that Hg losses from stationary sediments are minimal and that sediment transport is the major source of Hg movement in a river system. In laboratory tests, intact sediments from two lakes, one oligotrophic and one eutrophic, and two polluted rivers were treated with PhHgAc and incubated for up to 14 days under anaerobic or aerobic conditions. The amount of MeHg formed in the four sediments differed and seemed to be related to the amount of sulfide present and the general biological activity of the sediments. Biological pathways producing MeHg and methane did not seem to be directly related. (Prague-FIRL)

PHOTOCHEMICAL AEROSOL FORMATION IN THE ATMOSPHERE AND IN AN ENVIRONMENTAL CHAMBER,
California State Air Resources Board, El Monte.
R. J. O'Brien, J. R. Holmes, and A. H. Bockian.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 33-38, 1974. 6 fig.

Descriptors: *Aerosols, *Air pollution, *Smog, *California, Laboratory tests, Sampling, Pollutant identification.

During the summer of 1969 a sampling program for atmospheric particulates was initiated in the Los Angeles area. A diurnal variation in total particulate concentrations and light scattering was noted at Downtown Los Angeles, with peaks occurring after the initial direct emissions due to traffic had subsided, and coinciding with the rise of various photochemical phenomena such as oxidant formation. Chamber experiments with hydrocarbons produced copious amounts of aerosol reacted with nitric oxide. Paper and thin-layer chromatograms of atmospheric and synthetic (chamber generated) aerosols were similar, with spots corresponding to monocarboxylic acids, dicarboxylic acids, and acid nitrates common to both. The effectiveness of diolefins in producing light-scattering aerosol may be related to their ability to condense on preexisting particles rather than auto-nucleate when present at lower concentrations. VIRAL QUALITY MONITORING IN THE POLLUTED AQUATIC ENVIRONMENT,
Delaware Univ., Newark. Dept. of Chemistry.
M. P. Kraus.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 67-69, 1974.

Descriptors: *Monitoring, *Viruses, *Bioindicators, Algae, Pollutant identification, Water quality, Water pollution sources.

A model host/virus system can provide information on principles and mechanisms of virus transfer in water, so that, when the need arises, specific problems of aquatic virology may be solved. In particular, using such a model, blue-green algal cultures can provide a rapid, economical assay for virus in water. Genetic specificities recognizable by such a host can illustrate mechanisms of interspecies transfer among ecologically-related aquatic organisms. (See also W74-10947) (Knapp-USGS)

THE URBAN PLUME OF ST. LOUIS,
Washington Univ., Saint Louis, Mo. Dept. of Mechanical and Aerospace Engineering.
R. B. Husar, D. L. Blumenthal, J. Anderson, and W. E. Wilson.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974 Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 70-77, 1974, 4 fig.

Descriptors: *Air pollution, *Mapping, *Sampling, *Missouri, Smog, Winds, Meteorology.
Identifiers: *St. Louis(Mo), Urban heat island.

The urban plume of St. Louis, Missouri was mapped by an instrumented single engine aircraft which continuously measured the aerosol light scattering coefficient, total nuclei concentration, CO, SO2, O3, temperature humidity, and turbulence intensity. Under steady NE, 3m/s wind conditions the urban plume, measured at 35 and 50km downstream from downtown was almost gaussian with and confined to a mixing depth of 1000 m. Simultaneous pilot balloon soundings provided the vertical wind velocity profiles. The horizontal optical depth of aerosol plume added by the metropolitan area to the background was 2.5 while the average vertical optical depth was 0.2. Aerosol mass flow was at least 7,500 kg/hr. Under stagnant wind conditions, at night, strong evidence was found for the existence of an urban heat island with induced vertical air flow rising over downtown. In this case the urban plume is directed vertically and spread radially underneath an elevated inversion layer. (See also W74-10947) (Knapp-USGS)

SO2 OXIDATION MECHANISM IN OLEFIN-NOX-SO2 SMOG,
National Environmental Research Center, Research Triangle Park, N.C.
W. E. Wilson, M. C. Dodge, D. N. McNelis, and J. Overton.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 84-87, 1974. 4 fig, 6 ref.

Descriptors: *Smog, *Sulfates, *Air pollution, *Oxidation, Acids, Chemical reactions.
Identifiers: *Sulfuric acid, *Olefins, Ozone, Photochemical smog.

The atmospheric conversion of SO2 to sulfuric acid and various forms of sulfate is an important process in the global sulfur cycle and in urban areas. In the presence of olefinic hydrocarbons, nitrogen oxides, and light a fast indirect photochemical oxidation of SO2 occurs. There are a number of species present in smog which might react with SO2 to yield SO3: OH, HO2, O, O3, and a variety of oxygenated hydrocarbon radicals. The rates of reaction of SO2 with OH, HO2, O, and O3 are too slow to account for the indirect photochemical oxidation of SO2 in olefin-NOx smog. (See also W74-10947) (Knapp-USGS)

COMPARISON OF VOLUME AND MASS DISTRIBUTION FOR DENVER AEROSOLS,
National Environmental Research Center, Research Triangle Park, N.C.
T. L. Durham, W. E. Wilson, K. Willeke, and K. T. Whitby.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 95-101, 1974. 2 fig, 4 ref.

Descriptors: *Sampling, *Aerosols, Instrumentation, Air pollution, Dusts, Particle size, Distribution patterns, Turbidity, *Colorado.
Identifiers: *Denver(Colo).

Airborne particulate matter is sampled by various kinds of impactor-type mass measurement devices. Aerosol dynamics is also studied by measurements with the Minnesota Aerosol Analyzing System (MAAS). From the MAAS data, the volume concentration distribution can be calculated and then compared to mass concentration distribution. The MAAS infers the number distribution through measurements of electrical mobility for submicron particles and optical scattering for particles larger than 0.5 micron, whereas the impactors measure the mass concentration distribution as a function of aerodynamic diameter. Agreement between the measured data is good. The existence of a mode in the coarse particle range above 1 micron is indicated by both systems. A minimum is measured by the MAAS in the range 0.7 to 2.0. In this same size range the impactor's mass concentration decreases from high values for large particles to an approximately constant value for submicron particles. A mode in the submicron range is indicated only by the MAAS measurement. (See also W74-10947) (Knapp-USGS)
W74-10968

MASS AND COMPOSITION OF AN URBAN AEROSOL AS A FUNCTION OF SIZE FOR SEVERAL VISIBILITY LEVELS,
National Environmental Research Center, Research Triangle Park, N.C.
R. K. Patterson, and J. Wagman.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 102-107, 1974. 4 fig, 3 tab.

Descriptors: *Sampling, *Aerosols, Instrumentation, Air pollution, Dusts, Particle size, Distribution patterns, Turbidity, *New Jersey.
Identifiers: Nephelometers.

To determine how variations in aerosol mass, composition, and size distribution accompany variations in visibility in an urban area, an integrating nephelometer was used to monitor visibility and four sets of aerosol samples were taken during different visibility conditions. The sampling site was in Secaucus, New Jersey, approximately three miles west of Manhattan, New York. Samples were collected between September 29 and October 10, 1970. The mass distribution cannot be adequately characterized by a single, log-normal distribution. The mass distribution was fitted to a bimodal distribution and the five parameters defining the two long-normal distributions and the proportion of mass in each were determined. As visibility decreased the amount of mass below 2 microns increased and the MMD of the lower sized mode decreased. Both effects would increase the effective light scattering per unit mass. Union Carbide Corp., South Charleston, W. Va. Dept. of Engineering.
J. W. Sugar, and J. H. Brubaker.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 121-126, 1974.

Descriptors: *Monitoring, *Water pollution control, Industrial wastes, Water analysis, Waste water treatment, Chemical analysis, Analytical techniques, Pollutant identification.

Because of the highly variable chemical composition and hydraulic flow of industrial waste water, it is essential for industrial plants to use instrumentation to characterize pollutant discharges to public waterways. Based on Union Carbide's monitoring experience, a systematic approach to the development of a successful monitoring program is presented. This approach deals with establishing monitoring objectives, initiating a sound laboratory program, implementing on-line monitoring systems, anticipating maintenance and operating problems, determining personnel requirements and utilization of results to achieve maximum program benefits. Various on-line installations are used to illustrate the nature of Carbide's current monitoring program. (See also W74-10947) (Knapp-USGS)

DETERMINATION OF TRACE ORGANIC COMPONENTS IN AQUEOUS WASTES,
Monsanto Co., Saint Louis, Mo.
J. P. Mieure, F. M. Grogan, and M. W. Dietrich.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 127-128, 1974.

Descriptors: *Monitoring, *Water pollution control, *Industrial wastes, Water analysis, Waste water treatment, Chemical analysis, Analytical techniques, *Pollutant identification.

The pollutional significance of a waste water can be assessed only if the individual components in the effluent can be determined down to the levels at which they become environmentally insignificant. Methods that have been found effective for detecting, identifying and measuring many individual organic compounds at these levels in industrial effluents are discussed. These methods can be used to determine if a discharge problem exists, as well as to provide periodic analyses. They can also be used to guide the development of a continuous monitoring system should this be required. Emphasis is placed on methods which use the equipment and apparatus normally found in a plant analytical laboratory and which require a minimum of operator training. Three types of concentration procedures are compared: liquid-liquid extraction, collection in a porous polymer resin column by flowing water through the column, or collection in a porous polymer resin column by passing head space vapors through the column. W74-10974

WATER SAMPLING,
National Bureau of Standards, Washington, D.C.
P. D. LaFleur, and S. H. Harrison.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 129-134, 1974. 3 ref.

Descriptors: *Sampling, *Monitoring, *Water pollution control, Water analysis, Analytical techniques, Water quality control, *Pollutant identification.

Water quality control must use a total system approach. The particulates in the water, sediments, and organisms living in the water and in the sediments must be evaluated. Because of many variations the problems of obtaining representative samples are extremely difficult. Much of the analytical work being done today is being done on samples which do not really define the system in which they are taken. Too little care is given to the type of sampler involved, the contribution that that sampler may make to the components of interest in the analysis, and the stability of these components over a long period of time. (See also W74-10947) (Knapp-USGS)
W74-10975

ENVIRONMENTAL ANALYSIS OF OCEAN DUMPING,
Raytheon Co., Portsmouth, R.I. Oceanographic and Environmental Services.
G. V. Cox, and S. Townsend.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 155-156, 1974.

Descriptors: *Monitoring, *Sea water, *Water pollution sources, *Path of pollutants, Waste disposal, Remote sensing.

Concern for marine protection requires field monitoring programs in water, marine life and sediment quality. Ocean currents carry disposed wastes away from the dump zones. This requires a large field monitoring program. Mathematical models to predict dispersion and deposition require continuous current measurements at several depths in the water column. These models are necessary to predict zones of maximum potential impact. Use of ERTS - 1 Satellite real color and multispectral analysis helps to verify these models. (See also W74-10947) (Knapp-USGS)
W74-10977

TRANSMETHYLATION OF HEAVY METAL IONS IN WATER,
National Bureau of Standards, Washington, D.C.
K. L. Jewett, and F. E. Brinckman.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 218-225, 1974. 7 fig, 1 tab, 16 ref. EPA Grant R 801002.

Descriptors: *Heavy metals, *Mercury, *Path of pollutants, Chemical reactions, Organic compounds, *Ions.
Identifiers: *Platinum, *Palladium, *Transmethylation, Metal-organic compounds.

Biological transformations play an important role in aquatic transport of toxic metal. Thus for the palladium (II) or platinum (II) reactions with CH_3Hg, or with either $(CH_3)_3Sn$ or $(CH_3)_3Pb$, a rapid initial demethylation of the Main Group metal ion occurs, followed by a slower decomposition of transition metal methyl intermediates to eliminate available active methyl groups as inert organic gases liberated from the aqueous medium. The inhibitory or accelerative influence of anions is made very apparent. Strong ligands such as CN or SCN impede the initial transmethylation step. The formation and decomposition of the cis-dimethyldichloropalladium (II) anion with concomitant ethane ejection proceeds at a rate more rapid than the formation and decomposition of its

methyltrichloropalladium (II) precursor. This behavior is qualitatively consistent with the general appearance of several of the transient peaks seen in the NMR spectra. (See also W74-10947) (Knapp-USGS)
W74-10983

THE FLOW OF TRACE ELEMENTS THROUGH THE LOS ANGELES BASIN: ZN, CD, AND NI,
California Inst. of Tech., Pasadena. W. M. Keck Lab. of Environmental Health Engineering.
J. J. Huntzicker, C. I. Davidson, and S. K. Friedlander.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 245-250, 1974. 3 fig, 1 tab, 14 ref.

Descriptors: *Path of pollutants, Fallout, *Zinc, *Nickel, *Cadmium, *California, Roads, Water pollution sources, Dusts, Powerplants, *Trace elements, Heavy metals.
Identifiers: *Los Angeles County(Calif).

The two major sources of atmospheric Zn in the Los Angeles area are tire dust and metallurgical emissions. Tire dust contains approximately 1.5 percent by weight Zn. Most of the tire dust is associated with very large particles which settle close to the source. The primary source of airborne Ni is probably the combustion of fuel oil by power plants. The Ni content of fuel oil fly ash from the Pasadena power plant is 2 percent. The total emission of Ni is 260 kg/day. Cd is usually present in Zn ores and is emitted to the atmosphere during Zn smelting operations. Cd fallout rate is bout 5 kg/day. (See also W74-10947) (Knapp-USGS)
W74-10987

THE FLOW OF TRACE ELEMENTS THROUGH THE LOS ANGELES AREA: EFFECT ON NON-URBAN AREAS,
California Inst. of Tech., Pasadena. W. M. Keck Lab. of Environmental Health Engineering.
C. I. Davidson, J. J. Huntzicker, and S. K. Friedlander.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 251-255, 1974. 1 fig, 1 tab, 9 ref.

Descriptors: *Path of pollutants, Fallout, *Zinc, *Nickel, *Cadmium, California, Roads, Water pollution sources, Dusts, Powerplants, *Trace elements, Heavy metals.
Identifiers: *Los Angeles(Calif).

The effects of Los Angeles as a pollutant source on the surrounding non-urban areas are described. Of particular interest are the coastal waters, which are of economic, recreational and aesthetic importance to the area as a whole. The mass flows of Pb, Zn, Cd and Ni to these waters and also to the mountains and deserts surrounding the Los Angeles basin were studied. At least 3 of the 5.8 tons of Pb which are blown out of the urban basin each day are transported large distances from Los Angeles before being removed from the atmosphere. The effect of the urban basin as a pollutant source extends well beyond the geopolitical boundaries and what is an output for one geographical region is an input for the neighboring region. (See also W74-10947) (Knapp-USGS)
W74-10988

KINETIC STUDIES OF THE STABILITIES OF CHLOROMETHYL METHYL ETHER AND BIS (CHLOROMETHYL) ETHER IN HUMID AIR,
Dow Chemical Co., Midland, Mich.
J. C. Tou, and G. J. Kallos.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 298-299, 1974. 1 tab.

Descriptors: *Air pollution, *Organic compounds, Public health, Chemical reactions, Humidity, *Kinetics.
Identifiers: *Chloromethyl methyl ether.

Chloromethyl methyl ether (CMME) is one of the most commonly used chloromethylating agents in the manufacturing of commercial ionic resins. One of the impurities known to be present in CMME is bis (chloromethyl) ether (bis-CME). Possible industrial exposure to these two molecules and their stabilities in the environmental air are of great concern. The stabilities of these compounds in air at the ppm level were studied at different humidities using a silicone hollow fiber probe coupled with a mass spectrometer. The hydrolysis rate is proportional to the humidity of the air. Experimental data strongly indicate that the hydrolysis does not take place in the gas phase to any significant extent, but is triggered by the reactor surface. (See also W74-10947) (Knapp-USGS)
W74-10997

CARBON-MONOXIDE-INDUCED PARTICLES FROM HOPCALITE CATALYST,
Naval Research Lab., Washington, D.C.
J. K. Musick, and F. W. Williams.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 300-304, 1974. 2 fig, 4 ref.

Descriptors: *Trace elements, *Air pollution, *Heavy metals, *Catalysts, Chemical reactions, Aerosols.

High concentrations of metal-containing condensation nuclei are sometimes thermally induced from stabilized catalysts containing chromium, copper, and nickel under conditions closely resembling those found in automobile exhausts. Also, commercial and developmental catalyst formulations emit fine particles under a broad range of conditions at temperatures varying from 185 to 800C both in filtered air and in a mixture of 3 percent carbon monoxide in nitrogen. The emission of particles from hopcalite catalyst exposed to CO shows a concentration dependence which is related to time. The lower the CO concentration the longer it takes to realize particle production. (See also W74-10947) (Knapp-USGS)
W74-10998

THE PRODUCTION RATE OF SULFATE AEROSOL IN THE STRATOSPHERE: ENVIRONMENTAL IMPLICATIONS OF A STRATOSPHERIC AIRCRAFT FLEET,
California Inst. of Tech., Pasadena. W. M. Keck Lab. of Environmental Health Engineering.
J. J. Huntzicker.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 305-309, 1974. 1 fig, 13 ref.

Descriptors: *Sulfates, *Air pollution, *Aircraft, Chemical reactions, *Aerosols.

Stratospheric increases in aerosol loading will change the global albedo and possibly bring about climatic alteration. It is therefore quite important that the problem of aerosols associated with aircraft emissions in the stratosphere be thoroughly investigated. Current domestic jet fuels contain about 0.08% sulfur by weight. (See also W74-10947) (Knapp-USGS)

QUALITY OF WATER AND SUSPENDED SEDI MENTS IN THE BAKSAN AND MALKA RIVERS (O KACHESTVE VODY I VZVESHEN NYKH NANOSOV REK BAKSANA I MALKI),
I. A. Dolgushev.
Pochvovedeniye, No 7, p 137-140, July 1973. 1 fig 3 tab, 7 ref.

Descriptors: *Sediments, *Suspended solids *Suspended load, *Water quality, *Water chemis try, Water analysis, Chemical analysis, Sampling Inorganic compounds, Nutrients, Nitrogen Phosphorus, Potassium, Irrigated land, Irrigatio water, Irrigation, Irrigation canals, Sedimen discharge, Sediment load, Particle size.
Identifiers: *USSR, *Baksan River(USSR) *Malka River(USSR).

Sediment particle size and chemical composition and presence of potassium, phosphorus, nitrogen and elements harmful to plants were determined i sediment discharge and waters of the Baksan an Malka Rivers in 1967-68. Waters of the Baksan an Malka Rivers are suitable for irrigation of all crop grown on irrigated lands of the basin. Suspende river sediments have fertilizing properties and ca be transported to irrigated fields by silt-fre canals. The content of nitrogen, phosphorus, an potassium increases with decreasing particl diameter, reaching a maximum in particles les than 0.05 mm in diameter. (Josefson-USGS)

W. Schweers.
Mitteilungen der Bundesforschungsanstalt fue Forst- und Holzwirtschaft, No 93 (3. Hamburg Reinbeker Forst- und Holztagung 1973, Holz wirtschafliches Symposium 15. bis 16. Mai 1973), 171-183, Sept 1973. 12 tab, 6 ref.

Descriptors: *Pulp wastes, *Wast water(Pollution), *Pulp and paper industry, Ai pollution, Water pollution sources, Waste wate treatment, Biochemical oxygen demand Suspended solids, Lignins, Fibers(Plant), Oxygen Bleaching wastes, Sulfur compounds, Organi loading, Industrial wastes, Effluents.
Identifiers: *Germany(West Germany).

Water and air pollution caused by the West Ger man forest products industries and methods fo environmental control are discussed and evalu ated. Statistical data are tabulated for yearly ton nage productions of chemical (sulfite and kraft and mechanical (groundwood) pulps, paper an paperboard, hardboards, insulating and relate building boards, along with indications of the cor responding 5-day BOD, suspended solids, and at mospheric emission loads of mill effluents. Th total 5-day BOD of all German wood-chemical in

dustrial wastes was estimated at 175,420,000 t in 1970. Various methods for reductions in BOD, water and chemical consumptions, and fiber and lignin losses are indicated. Most of the systems of practical use are based on the recycling of condensates and other process streams, some with and some without full or partial biological treatment of effluents. Oxygen bleaching of pulp and the possible development of non-sulfur pulping processes for prevention of pollution are also mentioned. (Ward-IPC)

MERCURY ORGANIC MATTER ASSOCIATIONS IN ESTUARINE SEDIMENTS AND INTERSTITIAL WATER,
Florida State Univ., Tallahassee. Dept. of Oceanography.
S. E. Lindberg, and R. C. Harriss.
Environmental Science and Technology, Vol 8, No 5, p 459-462, May, 1974. 1 fig, 2 tab, 22 ref.

Descriptors: *Mercury, Ecological effects, *Organic matter, *Interstitial water, Sediments, Solubility, Salinity, Environmental control, Estuaries, *Florida.
Identifiers: *Anthropogenic additions, *Florida Everglades, *Mobile Bay Estuary.

Potential ecological effects of anthropogenic additions of mercury to natural environments are studied in the Florida Everglades and Mobile Bay Estuary. Significant associations were found between sediment mercury and sediment organic matter and between dissolved interstitial mercury and dissolved organic carbon. Interstitial water and sediments were sampled, both from surface and subsurface areas. With limited data, it appears that increasing salinity has a negative effect on the mercury complexing capacity of the dissolved organic matter. Interstitial dissolved mercury is enriched from 2.6 to 36.0 times over the associated surface water values, and in sulfide-rich pore waters far exceeds the thermodynamic solubility of HgS. This enrichment is probably due to formation of organic and polysulfide complexes with mercury. (Prague-FIRL)

Nat Belg. Vol 54, No 3, p 105-115, 1973. Illus.

Descriptors: *Organophosphorus pesticides, Biodegradation, Insect control.
Identifiers: Aedes cinereus, Aedes sticticus, Aedes vexans, Anopheles maculipennis, Carex acutiformis, Culex pipiens, Culiseta annulata, Culiseta morsitans, Lysimachia nummularia, Mosquitoes, Pharagmites communis, Ranunculus repens, Valeriana officinalis, Rhone Valley.

The proliferation of mosquitoes in the Rhone Valley, notably between Seyssel and Lyon (France), has necessitated ecological studies in order to eradicate the mosquitoes while maintaining maximal biological equilibrium. Of the 25 spp. of mosquitoes, only the 8 which are harmful to man were the object of the present anti-larval campaign. Eradication is being carried out on 4 ecological levels. Level 1 (permanently immersed Phragmites communis) contains species which lay eggs on the water: Culiseta morsitans, Culex pipiens, Anopheles maculipennis, Culiseta annulata. Level 2 (Phragmites communis and Carex acutiformis) contains species of Aedes with average to short larval cycles. Leverl 3 (Carex acutiformis and Valeriana officinalis) contains species of Aedes with average to short larval cycles. Level 4 (Ranunculus repens and Lysimachia nummularia) is infested with Aedes of short larval cycles: A vexans, A. sticticus and A. cinereus. Only minimal doses of biodegradable organic phosphorus insecticides with low toxicity for surrounding fauna are used, and chemical treatments are applied only to deposits containing larvae of target species. Physical techniques (e. g., sanitary engineering, maintenance of ditches and drains) yielded satisfactory results. This plan has successfully controlled harmful mosquitoes with minimal environmental pollution. Similar programs are being carried out on the Mediterranean and Atlantic coasts of France.--Copyright 1974, Biological Abstracts, Inc.

INVESTIGATIONS ON THE VIABILITY OF TRICHOMONAS VAGINALIS IN TAP WATER AND PUBLIC SWIMMING POOLS, (IN RUSSIAN),
Bonn Univ. (West Germany). Institut fuer Medizinische Parasitologie.
G. Piekarski, M. Saathoff, and D. Stueer.
Zentralbl Bakteriol Parasitenkd infektionskr Hyg Erste Abt Orig Reihe B Hyg Praev Med. Vol 157, No 2/3, p 202-214, 1973. English summary.

Descriptors: *Potable water, *Swimming pools.
Identifiers: *Trichomonas vaginalis.

T. vaginalis from cultures and vaginal secretions were suspended in tap water and bath water (Cl content: 0.44-0.56 mg/l). Different survival times were obtained, depending on the density of trichomonads. About 15 cells/2 million trichomonads survived up to 8 hr in 5 ml tap or bath water. Only a few trichomonads survived after 10 min in 240-480 ml tap water, and only up to 5 min in the same amount of bath water. Inundiluted culture medium (kept at 22C) a few trichomonads were capable of reproduction for up to 8 days and up to 24 hr in freshly obtained, undiluted vaginal secretion. Bath water and filter sludge from a public bath contained, in addition to free-living flagellates and ciliata, isolated worm eggs and nematode larvae, but no trichomonads. Free-living flagellates demonstrated microscopically could not be cultured. Trichomonads can be kept alive for a longer time in undiluted vaginal secretaion. Direct contact with toilet seats or bath grids contaminated with trichomonad secretion will easily cause infection. Wet bathing suits must not be exchanged.--Copyright 1974, Biological Abstracts, Inc.

FORECASTING OIL SLICK BEHAVIOR--A PRELIMINARY GUIDE,
Coast Guard, Washington, D.C. Applied Technology Div.
F. L. Orthlieb.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-762 358, Price $3.00 printed copy; $2.25 microfiche. Office of Research and Development In-House Study Report 724107.1, July 1971. 9 p, 2 fig, 3 ref.

Descriptors: *Oil pollution, *Oil spills, *Path of pollutants, Winds, Currents(Water), Oily water, Water pollution sources.
Identifiers: *Oil slicks.

A method is proposed for predicting the behavior of oil slicks at sea. It permits estimation of the growth of an oil slick due either to a sudden release of a known volume of oil, or to a continuous oil flow. Empirical observations are used as the basis for estimating slick drift due to wind and currents. The results for slick growth and drift can be combined to produce an approximate forecast of slick size and position versus time, as an aid to pollution control and cleanup activities until such time as more sophisticated modelling techniques are developed. EFFECTS OF SPREADING MANURE ON GROUNDWATER AND SURFACE RUNOFF,
Tennessee Univ., Knoxville. Dept. of Agricultural Engineering.
J. C. Barker, and J. I. Sewell.
Presented at the 1972 Annual Meeting, American Society of Agricultural Engineers, Hot Springs, Arkansas, June 27-30, 1972, Paper No 72-203, 10 p, 4 tab, 8 ref.

Descriptors: *Farm wastes, *Agricultural runoff, *Groundwater, *Irrigation, *Waste disposal, Sampling, Biochemical oxygen demand, Dairy industry, Slurries, Physical properties, Bacteria, Nitrates, Nitrogen, Dissolved solids, Chloride, Runoff, Surface runoff, Oxidation.
Identifiers: *Manure, *Spreading, Saturation area, Fecal coliform bacteria, Orthophosphate.

An experimental manure slurry irrigation system was established and the effects of the surface spreading of dairy manure slurry on surface runoff and groundwater quality were studied. Grab samples of surface and groundwater were collected on several dates between May 1971 and May 1972. Bacteriological analyses were performed on the samples for both total and fecal coliform bacteria. 5-day biochemical oxidation demand tests were conducted. The dissolved solids content of the filtered samples was determined, as well as nitrate nitrogen, orthophosphate, and chloride contents. Except for isolated cases, the bacterial and chemical concentrations of water samples from an area saturated with manure slurry were within the permissible criteria for raw water for public supplies. FECAL ELIMINATION OF ESTROGENS BY CATTLE TREATED WITH DIETHYLSTILBESTROL AND HEXESTROL,
Purdue Univ., Lafayette, Dept. of Animal Science.
M. R. Callantine, M. Stob, and F. N. Andrews.
American Journal of Veterinary Research, Vol 22, p 462-465, May, 1961. 2 tab, 13 ref.

Descriptors: *Farm wastes, *Cattle, *Sampling, Water pollution, Soil contamination, Fertilizers, Solid wastes, *Waste treatment.
Identifiers: *Estrogens, *Diethylstilbestrol, *Hexestrol, Hormones.

The estrogenic activity of the feces of estrogen-treated and control heifers in 6 groups was determined during a 24-week period following initiation of hormone treatment. Animals given 10 mg. of diethylstilbestrol orally per day excreted significantly more estrogen than did the controls or heifers subcutaneously treated with 24 or 36 mg. of either diethylstilbestrol or hexestrol. This excretion was uniformly high for the entire experimental period. Subcutaneous implantation with 36 mg. of diethylstilbestrol resulted in a greater total estrogen excretion than treatment with 24 mg. However, significant amounts of estrogen were excreted for 60 days following treatment with 24 mg. of diethylstilbestrol when compared to that excreted for 51 days following 36 mg. implantations; after this time, fecal estrogen elimination of heifers in both groups was similar to the controls. Implantation of heifers with 24 or 36 mg. of hexestrol did not result in greater fecal estrogen produced significant weekly variation in estrogen excretion. (Hargrove-East Central)

PRIMING EFFECT OF N-15 LABELED FERTILIZERS ON SOIL NITROGEN IN FIELD EXPERIMENTS,
Arizona Univ., Tucson. Dept. of Soils.
R. L. Westerman, and L. T. Kurtz.
Soil Science Society of America Proceedings, Vol 37, No 5, p 725-727, September-October, 1973. 1 tab, 15 ref.

Descriptors: *Nutrient removal, *Nitrogen, Leaching, Crop response, Water pollution sources, Fertilizers, Stable isotopes, Isotope studies, *Radioisotopes, *Sudangrass.

Evidence of the 'priming effect' on the uptake of soil N by additions of conservative amounts of fertilizer N was examined in data from two recently reported field experiments. In these experiments, urea and oxamide each labeled with N15 were compared on adjacent locations in successive years with 'Sudax SX11' Sorghum-sudan hybrid as the test crop. Additions of N fertilizer increased the uptake of soil N by 17 to 45% in the first experiment and by 8 to 27% in the second experiment. In the residual cutting of the first experiment, increase in uptake of soil N by the crops speculated to be due to stimulation of microbial activity by N fertilizers which increased mineralization of soil N, thus making more soil N available for use by plants. Identifiers: *Mercenaria mercinaria *Cerastoderma edule, Ferrous sulphate, Cockles Hardshell clam, Accumulation.

Two species of bivalve mollusca, the hard shel clam and the common cockle, collected every other month for one year at a number of sites i Southampton Water and the Solent, England, hav been analyzed to determine the concentration o zinc, copper, and iron in their soft tissues. Sedi ment samples from the estuary have also bee analyzed. Significant variations in the metal con tent in the tissues occur with respect to locality age, and season. These variations are discussed i relation to the conditions in the estuary and in par ticular, to metal concentrations in the sediments (Katz)

TYPICAL LEVEL OF LEAD IN MYTILUS GALLOPROVINCIALIS LMK FROM THE GULF OF TRIESTE,
Trieste Univ. (Italy).
L. Favretto, and F. Tunis.
In: Revue Internationale d'Oceanographie Medicale, Vol 33, p 67-74, 1974. 3 fig, 7 ref.

Descriptors: *Lead, *Mussels, Metals, Heavy metals, Analytical techniques, Methodology, Sampling, Quality control, Statistical methods, Statistics, Spectroscopy, Laboratory testing, Absorption, Bioassay.
Identifiers: *Mytilus galloprovincialis, *Gulf of Trieste, *Lead content determination, Atomic absorption spectroscopy, Extraction, Statistical analysis, Bioconcentration.

Lead in Mytilus galloprovincialis Lmk. from the Gulf of Trieste is considered in this study. Quality control of edible mussels is based on the typical average value and on the tolerance limits evaluated from a statistically controlled sampling. A rapid method has been developed for determining the lead content in the edible flesh. This method is based on the extraction of the pyrrolidine dithiocarbamate lead into n-heptan(2) one under controlled conditions and on the determination of the metal in the extract by atomic absorption spectroscopy. Intra-laboratory reproducibility has been defined and factors controlling accuracy have been optimalized. A statistical analysis has been performed on two samples from Duino (2 observations over a year) and from Sistiana (2 over a five-month period). Randomness of the sample has been confirmed and averages and variances between the samples do not differ significantly. (Katz)

LONG-TERM ANNUAL FLUCTUATIONS OF MERCURY IN THE ZOOPLANKTON OF THE EAST CENTRAL ADRIATIC,
Split Inst. of Oceanography and Fisheries (Yugoslavia).
T. Vucetic, W. B. Vernberg, and G. Anderson.
In: Revue Internationale d'Oceanographie Medicale, Vol 33, p 75-81, 1974. 2 fig, 2 tab, 18 ref.

Descriptors: *Mercury, *Zooplankton, Water pollution sources, Plankton, Path of pollutants, Metals, Heavy metals, Aquatic life, Bioassay, Water pollution, Trace elements, Absorption, Methodology.

Identifiers: *Adriatic Sea, Metal cycling, Polyvinyl chloride production.

The mercury content has been determined in zooplankton (dry weight) collected from two stations in the coastal area from 1964-1969 and from one station in the deep Adriatic from 1967-1969. The mercury content of the zooplankton from the deep Adriatic is higher than in unpolluted areas and averaged 2.86 ppm Hg. It is possible that this is the result of polluting industries located around its shores. In the coastal area the highest values from 3(4)-16 ppm Hg were found in 1964-1965 samples and decreased to approximately 2.0 ppm for the other years. From the results of this study it would seem that the waters of the Adriatic have substantial mercury contamination. (Katz)

A SEASONAL SURVEY OF THE FISHES IN THE MYSTIC RIVER, A POLLUTED ESTUARY IN DOWNTOWN BOSTON, MASSACHUSETTS,
Woods Hole Oceanographic Institution, Mass.
R. L. Haedrich, and S. O. Haedrich.
Estuarine and Coastal Marine Science, Vol 2, No 1, p 59-73, 1974. 4 fig, 3 tab, 29 ref.

Descriptors: *Marine fish, Analytical techniques, Biomass, Water quality, Environmental effects, Smelts, Biological communities, Estuaries, Estuarine environment, Seasonal, Statistical models, *Massachusetts.
Identifiers: *Species diversity, *Environmental quality, *Mystic River(MA), Flounder, Alewives, *Boston, Eels, Shad, Herring, Cod, Hake, Cottids, Mackerel, Pollock, Stickleback, White perch, Silvensides.

Twenty-three species of marine fishes were taken in the Mystic River during surveys conducted four times in a year to determine a measure of the environmental quality of the estuary. Winter flounder was the dominant species, with alewives and smelt abundant on a seasonal basis. Diversity H on number of species and on weight was determined and ranged from 0.33 in August to 1.03 in June and from 0.12 in August to 0.75 in March, respectively. During the warmest period, fishes tended to be found in the lower portions of the estuary but in winter they were concentrated upriver. The annual diversity H in the Mystic River is 1.19 (on numbers) and 0.71 (on weight). The values fall near the low end of the diversity scale, indicating a fairly low degree of environmental quality. (Katz)

DISTRIBUTION OF TOTAL MERCURY IN THE FISHES OF LAKE OAHE,
Environmental Protection Agency, Kansas City, Kans. Region VII.
C. M. Walter, H. G. Brown, and C. D. Hensley.
Water Research, Vol 8, No 7, p 413-418, 1974. 1 fig, 6 tab, 9 ref.

Descriptors: *Mercury, Absorption, Bioassay, Freshwater fish, Sport fish, Analytical techniques, Bass, Pikes, Catfishes, Sediments, Microorganisms, Organic compounds, Path of pollutants, *South Dakota.
Identifiers: *Lake Oahe(SD), *Methyl mercury, Methylation, Crappie, Buffalo fish, Burbot.

The total mercury content of fish and sediment in Lake Oahe, South Dakota was investigated in 1971. Average total mercury concentration of 225 fish flesh samples was 0.27 mg/kg; game fish samples averaged 0.31 mg/kg and nongame fish samples averaged 0.22 mg/kg. Data include total mercury analyses of 43 sediment samples. Results support the contention that a continuous mercury methylation process in the sediments will eventually contaminate a fish population even though analysis indicates undetectable levels of total mercury (<0.2 micro mg/l) in the overlying water. It is also indicated that game fish show a greater propensity to accumulate mercury forms than nongame fish. (Katz)

NUMERICAL INDICES APPLIED TO THE RESULTS OF A SURVEY OF THE MACRO-INVERTEBRATE FAUNA OF THE TAMAR CATCHMENT (SOUTHWEST ENGLAND),
Cornwall River Authority, Launceston (England).
P. M. Nuttall, and J. B. Purves.
Freshwater Biology, Vol 4, No 3, p 213-222, 1974. 3 fig, 1 tab, 39 ref.

Descriptors: *Evaluation, *Water quality, *Invertebrates, Quality control, Theoretical analysis, Water analysis, Bioindicators, Habitats, Biological communities, Sewage effluents, Farm wastes, Water pollution effects, Analytical techniques, Benthos.
Identifiers: *Numerical indices, *Diversity index, *River Tamar(England).

A survey of the macro-invertebrate fauna in the River Tamar shows a division of the catchment can be made which separates an organically enriched upper region from a more stable environment in the lower tributaries and reaches. Invertebrate species associated with organic pollution were found downstream from farm waste and sewage effluent outfalls. Invertebrate species normally associated with an unpolluted condition were widely distributed throughout the catchment, and revealed that the Tamar is essentially free from gross pollution causing the elimination of stream fauna. Systems used by pollution control organizations to codify biological results are reviewed and applied comparatively to the results. The Diversity index was found to be the most consistent method in assessing the biological state of the river. (Katz)

METHYLMERCURY EXPOSURE, MERCURY LEVELS IN BLOOD AND HAIR, AND HEALTH STATUS IN SWEDES CONSUMING CONTAMINATED FISH,
National Swedish Food Administration, Stockholm. Dept. of Food Research.
S. Skerfving.
Toxicology, Vol 2, p 3-23, 1974. 9 fig, 5 tab, 45 ref.

Descriptors: *Mercury, *Human pathology, Public health, Path of pollutants, Foods, Water pollution, Metals, Bioassay.
Identifiers: *Methylmercury, *Fish consumption, Half-life.

Levels of total mercury in blood cells ranging 8-390 ng/g were found in 162 Swedes who consumed fish containing 0.3-7 mg Hg/kg. Levels were seen to correlate to the age of the subject, with subjects over 40 years of age showing levels above 100 ng/g, and to the concentration of mercury in fish consumed. Long-term exposure to 4 micrograms Hg as methylmercury/kg body weight/day--as estimated from fish intake records--corresponded to a blood cell mercury of about 300 ng/g. The biologic half-time of mercury in blood cells ranged from 58-87 days in 4 subjects, up to 164 days in one individual. No clearcut signs of methylmercury poisoning were found in the screened subjects. Some subjects had various symptoms, but with no statistically higher frequency in the high-mercury (82-1100 ng/g blood cells) group than in the low mercury (12-75 ng/g) group. (Katz)

T. M. Leatherland, and J. D. Burton.
Journal of the Marine Biological Association of the United Kingdom, Vol 54, p 457-468, 1974. 1 fig, 5 tab, 38 ref.

Descriptors: *Absorption, *Trace elements, *Sediments, Bioassay, Neutron activation analysis, Arsenic compounds, Cadmium, Mercury, Zinc, Bottom sediments, Methodology, Analytical techniques, Algae, Molluscs, Path of pollutants, Environmental effects, Geochemistry, Spectrophotometry, Freshwater, Sewage.
Identifiers: *Bottom mud, *Solent(UK), Accumulation, Antimony, Southampton water, Fucus ssp, Littorina ssp, Tealia ssp.

Measurements were made, by neutron activation analysis, of arsenic, cadmium, antimony, mercury and zinc in organisms and bottom muds from Southampton Water and Solent. The values are on a dry weight basis and refer primarily to whole organism soft tissues. Concentrations of mercury in algae ranged from 0.07 to 0.22 ppm and those in animal tissues from 0.06 to 1.9 ppm. Variations among organisms from different parts of the solent area and comparisons with other regions suggested some possible influences of local waste discharge, but there was no evidence of major effects. Anoxic muds contained higher concentrations of mercury than occurred in unreduced surface layers, suggesting mobility in interstitial waters of the uppermost zone and fixation under reducing conditions. The average concentrations of cadmium in algae and fish from substantially unpolluted waters were 0.3 and 0.03 ppm, respectively, while the range for marine Gastropod and Lamellibranch molluscs was from 0.3 to 21 ppm. Increased concentrations, by about two orders of magnitude, were found in Fucus serratus and Littorina littoralis from the Severn Estuary. Bottom muds from areas of low pollution contained, on average, 0.6 ppm. Concentrations of arsenic in molluscs were in the range from 3 to 24 ppm, while fish muscle contained an average of 5 ppm. Relatively high concentrations occurred in Tealia (72 ppm). Antimony occurred usually in the range from 0.01 to 0.1 ppm, with low values in fish muscle. The average concentrations of arsenic and antimony in bottom muds from Southampton Water were 14 and 1.0 ppm respectively. (Katz)

COPEPOD AND CHLOROPHYLL A CONCENTRATIONS IN RECEIVING WATERS OF A NUCLEAR POWER STATION AND PROBLEMS ASSOCIATED WITH THEIR MEASUREMENT,
Woods Hole Oceanographic Institution, Mass.
E. J. Carpenter, S. J. Anderson, and B. B. Peck.
Estuarine and Coastal Marine Science, Vol 2, No 1, p 83-89, 1974. 1 fig, 4 tab, 12 ref.

Descriptors: *Cooling water, *Copepods, *Chlorophyll, Plankton, *Thermal pollution, Heated water, Cooling water, Water pollution sources, *Nuclear power plants, Sampling, Methodology, Water quality.
Identifiers: Chlorophylla.

Copepod and chlorophyll a concentrations were measured in the sea water mixing zone of cooling water from a nuclear power plant and in a control area (containing no cooling water). No significant differences were observed between the two areas for these parameters; however, it is known that about 70% of the copepods and 80-100% of the phytoplanktonic photosynthesis are eliminated in the 95,000 cu m/h of sea water entrained through the power plant. From the data collected, which consisted of five replicate plankton tows or chlorophyll measurements at each of four stations on five dates, it was calculated that the sampling program was not able to detect the (approximate) 5% reduction that occurred in population size. These data indicate the importance of determining the ability of a sampling program to measure a population change before concluding that a suspected pollutant has not affected the population. It also shows the inability of conventional methods of measuring plankton densities to detect relatively small changes. (Katz)

DDT, DDE, AND PCBS IN THE TISSUES OF REEF DWELLING GROUPERS (SERRANIDAE) IN THE GULF OF MEXICO AND THE GRAND BAHAMAS,
Texas A and M Univ., College Station.
C. S. Giam, R. L. Richardson, D. Taylor, and M. K. Wong.
Bulletin of Environmental Contamination and Toxicology, Vol 11, No 2, p 189-192, 1974. 1 fig, 1 tab, 10 ref.

Descriptors: *Gulf of Mexico, *Chlorinated hydrocarbon pesticides, *DDT, *DDE, *Polychlorinated biphenyls, Absorption, Bioassay, Public health, Pollutants, Pesticides, Path of pollutants, Distribution, Reefs, Coral.
Identifiers: *Grouper, *Serranidae, Bahamas, Epinephelus ssp, Mycteroperca ssp.

The levels of chlorinated hydrocarbons in the muscle tissues of groupers were investigated. Groupers spend most of their post larval life in one location, thus providing data most representative of the area, in this case, the coral reefs of the Gulf of Mexico and the Grand Bahamas. Results of the bioassay indicate that the levels of pollutants are generally low with little danger in regard to human consumption. In the locations showing higher concentrations of chlorinated hydrocarbons than the average, the levels of pollutants in the groupers increased with increasing size. The relationship is expected, as the fat content increases with increasing size and age of the specimen. (Katz)

COPPER CONTENT IN THE INSHORE AND ESTUARINE WATERS ALONG THE CENTRAL WEST COAST OF INDIA,
National Inst. of Oceanography, Panjim (India).
V. N. Sankaranarayanan, and C. V. G. Reddy.
Current Science, Vol 42, No 7, p 223-224, April, 1973. 1 fig, 2 tab, 9 ref.

Descriptors: *Copper, *Water analysis, *Estuaries, Water chemistry, Laboratory tests, Inorganic compounds, Analytical techniques, Spectroscopy, Surface runoff, Productivity, Path of pollutants.
Identifiers: *India.

The occurrence of copper in the chloroplasts, haemocyanin and in several enzymes indicates its importance in controlling productivity. Paradoxically copper concentrations of more than 1 ppm are also known to be toxic to aquatic life. This study was undertaken to determine the distribution of copper in the inshore, estuarine and river waters of the Goa coast. The concentration of copper in the bottom waters was invariably higher than in the surface in the inshore, estuarine and river waters. In the inshore region the surface values ranged from 3-46 micrograms/l and the bottom values between 10 and 76 micrograms/l. High concentrations (greater than 20 micrograms/l) at the surface and at the bottom were encountered at all sections except off Cape Ramas. A general increase in the levels toward the north was also noticeable. The ionic copper concentration in the coastal waters was predominantly controlled by land runoff. There are four important rivers opening into the sea in the region of observation. These rivers flowing through the ore bearing (iron and manganese) terrain might be picking up the element and thus perhaps be responsible for the very high values observed. (Jernigan-Vanderbilt)

THE CONCENTRATION CONTROL OF SOLUBLE COPPER IN A MINE TAILINGS STREAM,
Montana Univ., Missoula. Dept. of Geology.
B. I. Collins.
Geochimica et Cosmochima Acta, Vol 37, p 69-75, 1973. 2 fig, 2 tab, 10 ref.

Descriptors: *Copper, *Mine drainage, *Adsorption, *Hydrogen ion concentration, *Distribution, Drainage water, Chemical reactions, Chemical precipitation, Laboratory tests, Analytical techniques, Spectroscopy, Mine wastes, Surface runoff.
Identifiers: *Malachite, *Tenorite.

The stability fields of cupric hydroxide (determined by a cupric sensitive electrode), malachite ($Cu_2(OH)_2CO_3$), and tenorite (CuO) were compared to the total dissolved copper and hydrogen ion concentration of samples from an abandoned copper mine mill tailings stream and the river into which the stream flows. A loss of four orders of magnitude total dissolved copper from the 0.001 M in the tailings pond water to the 10 to the minus 7th power M in the Ompompanoosuc River is an expected resulted in a terrain where the pH of the water is controlled by carbonate in the local rock and where normal amounts of stream sediment exist. Under such conditions, copper concentrations downstream quickly drop to near background levels. However, the loss of copper where it is not attributable to dilution is probably due to sorption by the iron hydroxide present and is not the result of precipitations of CU(II) solids. (Jernigan-Vanderbilt)

THE AVIFAUNA OF SWEDEN AS INDICATORS OF ENVIRONMENTAL CONTAMINATION WITH MERCURY AND CHLORINATED HYDROCARBONS,
Environmental Protection Board, Stockholm, (Sweden). Wallenberg Laboratoriet.
S. Jensen, A. G. Johnels, M. Olsson, and T. Westermark.
In: Proceedings of the XVth International Ornithological Congress p 455-465, 1972, E. J. Brill, Leiden. 7 fig, 2 tab, 33 ref.

Descriptors: *Mercury, *Chlorinated hydrocarbon pesticides, *Birds, Pollutants, Environmental effects, Neutron activation analysis, Water birds, Game birds, Migratory birds, Food chains, Predation, *Bioindicators.
Identifiers: *Sweden.

Predatory birds were used to investigate the historical development of mercury contamination and as biological indicators of environmental contamination. Carnivores were used in these studies because higher concentrations of pollutants associated with the top levels of the food chain made quantitative analysis easier. Analyses of a number of accurately dated specimens of the Goshawk from Sweden indicated that the original level of mercury content of feathers was 2200ng/g. Use of inorganic mercury compounds for seed dressing beginning in the 1940's resulted in levels of approximately 20,000ng/g before legislation was passed prohibiting their use in 1966. The effects of mercury contamination of the aquatic environment on predatory birds were investigated by analyzing the feathers of Osprey and the Great Crested Grebe, both of which live chiefly on fish. The increase of mercury in these species was gradual. The seasonal migration of the Osprey resulted in mercury concentrations which varied according to the time of year. Birds from brackish water environments exhibited concentrations of mercury and chlorinated hydrocarbons in muscle tissue and extractable fat, respectively. (Jerome-Vanderbilt)
W74-11367

MERCURY POLLUTION,
HSMHA Health Reports, Vol 86, No 5, p 414-415, May, 1971 1 photo.

Descriptors: *Mercury, *Water pollution, *Great Lakes, *Public Health, *Fish, Pollutants, Metals, Environmental effects, Effluents, Industrial wastes, Sediments, Regulation, Water quality control, Data collections, Flow, Human pathology.
Identifiers: *Lake St Clair, *St Clair River.

A brief general report on the sources of mercury pollution and its effects is presented. Mercury pollution in the Great Lakes area resulted from the dumping of untreated effluents by chloralkali factories, paper manufacturing plants, and other industrial sources. Government action prohibited all commercial fishing in the Michigan waters of Lake St. Clair and the St. Clair River, and industrial plants have generally ceased the dumping of mercury. The Food and Drug Administration has set 0.5 ppm as a safe mercury level and some fish in Lake St. Clair have exhibited mercury concentrations as high as 7ppm. Although the flushing time of the lake is one year, this does not apply to the lake bottom sediments and the fish; it will take much longer before mercury levels are considered safe. Although there have been no reported cases of mercury poisoning due to Lake St. Clair fish, some minor or early cases may have escaped notice. (Jerome-Vanderbilt)
W74-11368

OXIDATION EFFECT ON THE ANALYSIS OF IRON IN THE INTERSTITIAL WATER OF RECENT ANOXIC SEDIMENTS,
Case Western Reserve Univ., Cleveland, Ohio. Dept. of Geology.
B. N. Troup, O. P. Bricker, and J. T. Bray.
Nature, Vol 249, p 237-239, May 17, 1974. 2 fig, 17 ref.

Descriptors: *Iron, *Oxidation, *Sediments, *Sampling, Connate water, Nitrogen, Analytical techniques, Anaerobic conditions, *Chesapeake Bay, Water pollution sources.
Identifiers: *Anoxic sediment.

The importance of oxidation in the studies on the concentration of trace constituents in the interstitial water of anoxic sediments in the Chesapeake Bay was evaluated. Nine cores were taken in rapid succession; a layer of each core, 67-72cm below the sediment-water interface, was extruded, homogenized and loaded into two 2.5cm squeezers. One of the pair of squeezers from each core was never exposed to the atmosphere and was manipulated under nitrogen. The second squeezer of each pair was removed from the nitrogen glove bag after loading and exposed to the atmosphere for 15min with its top removed. An aliquot was taken simultaneously from each of the squeezers after 15ml of interstitial water had been squeezed. It was concluded that discrete sampling and analysis of the aliquot directly from the squeezer, under a nitrogen atmosphere, is the best method of ensuring analytical accuracy, and the rapid change in Fe(II) concentration observed in the initial period of squeezing must result from the oxidation of ferrous ion to ferric hydroxide by the small amount of oxygen trapped in the squeezer during transfer of sediment from the core to the squeezer. (Jernigan-Vanderbilt)

PREDICTING CHELATE PERFORMANCE IN BOILERS,
J. Stephens, and J. Walker.
Industrial Water Engineering, Vol 10, No 4, p 30-32, July/August, 1973. 1 fig, 6 ref.

Descriptors: *Chelation, *Magnesium, *Calcium, *Chemical precipitation, Chemical reactions, Analytical techniques, Spectroscopy, Industrial water, *Nitrilotriacetic acid.

The objective was to determine the ability of NTA to prevent calcium precipitation in the presence of potential precipitating anions such as carbonate, silicate, and phosphate. The results of the study, which was performed in a test boiler operating at 200psi, clearly indicated that: (1) NTA will prevent the deposition of all calcium deposits normally encountered in boilers except calcium phosphate; (2) the amount of calcium that can be chelated by an excess of NTA in the presence of phosphate is so low that the original purpose of chelating agents is defeated by the combined chelate/phosphate treatment; and (3) magnesium deposition will not occur in chelate-treated boilers if the makeup water is at least of sodium zeolite quality, unless the silicate content or alkalinity of the boiler water is abnormally high. (Jernigan-Vanderbilt)

THE DISTRIBUTION OF TRACE METALS IN THE SURFICIAL SEDIMENTS SURROUNDING KEWEENAW POINT, UPPER MICHIGAN,
Wisconsin Univ., Madison. Sea Grant Minerals Program.
P. A. Smith, and J. R. Moore.
In: Proceedings of the Fifteenth Conference on Great Lakes Research, April, 1972, Madison, Wisconsin, Sea Grant College Reprint No WIS-SG-73-341, 11 p, 7 fig, 5 tab, 14 ref.

Descriptors: *Trace metals, *Distribution, *Sediments, *Lake Superior, Data collections, Analytical techniques, Spectroscopy, Copper, Zinc, Cobalt, Nickel, Tin, Drainage, *Michigan, *Path of pollutants, Water pollution sources.
Identifiers: *Keweenaw Point(MI).

Surficial sediments around Keweenaw Point were collected during late August, 1971. The trace metal data for the recovered sediment samples are presented. Determinations are based upon 54 atomic absorption analyses (perchloric acid extraction) for Cu, Zn, Co, Ni, and Sn, using the minus 80 U.S. standard sieve mesh size fraction of the sediments. Indications are that two district areas are delineated by the results, separated from each other by the Keweenaw Fault trending east-west at a latitude of approximately 47 degrees 23 minutes north. To the south of the fault the sediments have mean value trace metal concentrations at 32.2ppm for Cu, 57.3ppm for Zn, 31.1ppm for Ni and 18.7ppm for Co. These concentrations are distributed according to drainage patterns associated with sediments deposited from streams draining a mineralized area. The northern sediments, off Copper Harbor, exhibit higher values, including 160.2ppm for Cu, 79.8ppm for Zn, 53.8ppm for Ni and 23.2ppm for Co. The enhanced concentrations to the north of the Keweenaw Peninsula appear to reflect the dominant geology of the onshore area of the northern coastline. This enrichment is in contrast to the sediments to the south of the fault where the trace metal contribution of drainage from the Peninsula has been diluted by multiple sources of sediments, especially from the Jacobsville Sandstone. UNDERWATER COPPER EXPLORATION IN LAKE SUPERIOR PROSPECTS MAPPED IN 1971,
Wisconsin Univ., Madison. Sea Grant College Program.
J. R. Moore, R. P. Meyer, and R. J. Wold.
Preprint from the Offshore Technology Conference, Houston, Texas, May, 1972, Paper No OTC 1648, Sea Grant College Reprint No WIS-SG-73-338, 16 p, 11 fig, 8 ref.

Descriptors: *Sediments, *Copper, *Lake Superior, *Trace metals, Geological surveys, Geologic mapping, Seismic studies, Rock properties, Zinc, Cobalt, Tin, Nickel, Magnetic studies, *Michigan, Wisconsin, *Path of pollutants, Exploration, Baseline studies.
Identifiers: *Keweenaw Penninsula(MI).

During the late summer of 1971, marine geologists and geophysicists conducted a combined seismic, magnetometry, and dredging survey in Lake Superior waters surrounding the outer Keweenaw Peninsula. The principal objective of this continuing investigation is to assess the potential for lode copper beneath the shallow waters surrounding the Keweenaw copper producing district. Approximately 1000 track miles of (a) high resolution acoustic profiles, (b) intermediate depth air-gun seismic profiles, (c) continuous magnetometer records, and (d) some 200 dredge and grab samples of the bottom as well as coastal sediments and sublake rock exposures were collected. Subsequent to the cruise, the geophysical records have been under study, and all sediment and rock samples have been analyzed for copper, zinc, cobalt, tin, and nickel. Three areas have been identified as potential interest sites. Chemical and bathymetric data provide an environmental quality baseline in the event of subsequent mining. FORMATION OF METHYLMERCURY IN A TERRESTRIAL ENVIRONMENT,
National Environmental Research Center, Las Vegas, Nev.
W. F. Beckert, A. A. Moghissi, F. H. F. Au, E. W. Bretthauer, and J. C. McFarlane.
Nature, Vol 249, p 674-675, June 14, 1974 1 fig, 6 ref.

Descriptors: *Mercury, *Bacteria, *Chemical reactions, Organic compounds, Inorganic compounds, Agriculture, Toxicity, Public health, Analytical techniques, Onsite laboratories, Metals, *Path of pollutants, Water pollution sources.
Identifiers: *Methylmercury.

The possible organomercury compound formation in soils contaminated with an inorganic mercury compound by methonogenic bacteria was investigated. Experiments were conducted and the results showed that mercuric salts can, under agricultural conditions, be transformed into methylmercury. The conversion in a terrestrail environment of inorganic mercury compounds to methylmercury implies that recycling of mercury from soil to air and back to soil or water could occur faster than presently assumed on the basis of the volatility of metallic mercury and inorganic compounds along. Due to the formation of methylmercury compounds and their high volatility mercury compounds deposited in soil are more readily available to humans and animals than previously anticipated, the consequent health hazard being magnified by the higher toxicity of methylmercury. (Jernigan-Vanderbilt)

DIGITAL MODELING OF RADIOACTIVE AND CHEMICAL WASTE TRANSPORT IN THE SNAKE RIVER PLAIN AQUIFER AT THE NATIONAL REACTOR TESTING STATION, IDAHO,
Geological Survey, Idaho Falls, Idaho.
J. B. Robertson.
Available from NTIS, Springfield, Va., 22161 a
USGS 1D0-22054, Price $4.00 printed copy; $2.2
microfiche. Open-file report 1D0-22054 (USAEC
TID-4500), May 1974. 41 p, 22 fig, 13 ref.

Descriptors: *Path of pollutants, *Groundwate
movement, *Idaho, *Radioactive wastes
*Mathematical models, Numerical analysis, Finit
element analysis, Dispersion, Sorption, Chlorides
Tritium, Strontium, Cesium.

Industrial and low-level radioactive liquid waste
at the National Reactor Testing Station (NRTS) i
Idaho have been disposed to the Snake River Plai
aquifer since 1952. Tritium and chloride hav
dispersed over a 15sq mi area of the aquifer in lo
but detectable concentrations and have onl
migrated as far as 5mi downgradient fro
discharge points. The movement of cationic wast
solutes, particularly Sr-90 and Cs-137, has bee
significantly retarded due to sorption, principall
ion exchange. Cs-137 has shown no detectabl
migration in the aquifer and Sr-90 has migrate
only about 1.5mi from the Idaho Chemica
Processing Plant discharge well, and is detectabl
over an area of only 1.5 sq mi of the aquifer
Digital modeling techniques were applied by utiliz
ing numerical solution of the coupled equations o
groundwater motion and mass transport. Th
model includes the effects of convective trans
port, flow divergence, two-dimensional hydrauli
dispersion, radioactive decay, and reversibl
linear sorption. Hydraulic dispersion (especiall
transverse) is a much more significant influenc
than previously suggested by earlier studies. Th
model was used to estimate future waste migratio
patterns for varied assumed hydrological an
waste conditions up through the year 2000. Th
hydraulic effects of recharge from the Big Lo
River have an important (but not predominant) in
fluence on the simulated future migration patterns
Detectable concentrations of waste chloride an
tritium could move as much as 15mi downgradien
from the original discharge points by the yea
2000. However, SR-90 could move only 2 to 3m
downgradient in the same time. The model ma
also be used to estimate the effects of the variou
future waste disposal practices and hydrologi
conditions on subsequent migration of wast
products.

MONITORING TOXAPHENE CONTAMINATION IN A GEORGIA ESTUARY,
Georgia Univ., Sapelo Island. Marine Inst.
R. J. Reimold, and C. J. Durant.
Available from NTIS, Springfield, Va. 22161 a
COM 73-10721, Price $3.00 printed copy, $2.2
microfiche. Marine Science Center Technical Re
port Series No 72-8, November 1972. 17 p, 9 fig,
tab, 6 ref.

Descriptors: *Path of pollutants, *Pesticides
*Estuaries, *Georgia, Biomass, Marsh plants
Grasses, Salt marshes, Aquatic environment, Pol
lutant identification.
Identifiers: *Toxaphene, Terry Creek(GA), Spar
tina.

The flux of toxaphene was traced through the sal
marsh cordgrass in an estuary in Georgia. The onl
part of the cordgrass plant accumulating tox
aphene was the leaves (36 ppm). Seed heads hav
relatively low concentrations, and therefore, ma
not be a great source of contamination for marsh
birds which feed upon them. The quantities of tox
aphene found in anchovies collected from severa
collection sites during the two years of the stud
show a significant reduction in levels during th
second year. In a carnivorous fish, Fundulu
heteroclitus, toxaphene shows significan
decreases in levels during the second year, and th
concentrations are much lower than in th
anchovy. Toxaphene appears to be concentrate
in the white shrimp heads and thorax by a factor o
about ten times that found in the edible abdomina
portions. In the 150 species of estuarine organism

ested, the levels of toxaphene were considerably ower in 1971-1972 than in the preceding year. A significant increase in species diversity was found n Terry Creek during the past two years. A considerably higher biomass was detected during the second year of the study. (Knapp-USGS)

5C. Effects Of Pollution

WATER-BORNE TRANSMISSION OF CHLORAMPHENICOL-RESISTANT SALMONELLA TYPHI IN MEXICO,
Institute of Health and Tropical Diseases, Mexico City. Epidemiology Unit.
A. Gonzalez-Cortes, D. Bessudo, R. Sanchez-Leyva, R. Fragoso, and M. Hinojosa.
Bulletin of the Panamerican Health Organization, Vol 8, No 1, p 1-5, 1974. 1 fig, 2 tab, 8 ref.

Descriptors: *Human diseases, *Potable water, *Mexico, *Salmonella, Water pollution sources, Water supply, Irrigation canals, Municipal water, *Epidemics, Water pollution effects.
Identifiers: *Typhoid fever, Salmonella typhi.

In mid-1972 an outbreak of typhoid fever occurred n a small village in Central Mexico. Eighty-three cases were recorded with six deaths. Most patients ived in an area of the village with the highest population density and lowest income levels, close o an irrigation canal which traverses the village. Prior to the epidemic, the municipal water system had not been operational because of a defective pump. Food-specific attack rates implicated the drinking of water from the canal as the source of he disease with restoration of the water system promptly halting the outbreak. (Sandoski-FIRL)

A NEW NATURAL FACTOR IN THE SELF-PURIFICATION OF WATER BASINS (A VIZTAROLOK ONTISZTULASANAK UJ TERMESZETES TENYEZOJE),
G. I. Szidorenko, G. A. Bagdaszarjan, and J. G. Talajeva.
Egeszsegtudomany, Vol 17, No 4, p 350-355, 1973. English summary.

Descriptors: Water pollution effects, Microorganisms, *Pathogenic bacteria, *Water purification, *Self-purification, Potable water.
Identifiers: *Bdellovibrio, Microbial contamination.

The problems of microbial contamination in open water basins and other water sources are discussed with respect to potable water and increasing industrial effects. Some microorganisms in the water and soil are known to kill human pathogens; the most exhaustively studied phenomenon is self-purification by Bdellovibrio in water basins. Culturing, biological features and temperate-zone incidence of the Bdellovibrio have been investigated in detail by the Sisin Institute since 1968. The seasonal changes in their incidence and occurrence of new strains have been documented. (Murphy-FIRL)

EFFECTS OF DIETARY MERCURY ON MINK,
Michigan State Univ., East Lansing. Dept. of Poultry Science.
R. J. Aulerich, R. K. Ringer, and S. Iwamoto.
Archives of Environmental Contamination and Toxicology, Vol 2, No 1, p 43-61, March, 1974. 6 tab, 25 ref.

Descriptors: *Toxicity, Organic matter, Inorganic matter, *Mink, Fish, *Mercury, Great Lakes region, Food chains, Lake Erie, Lakes, Rivers, Canada, Fish toxins.
Identifiers: *Methylmercury, *Mercuric chloride.

Mercury contamination in Lake Erie and other lakes and rivers in the United States and Canada caused mink ranchers to consider the possibility that mink who ingested mercury-contaminated fish were contacting mercury poisoning. Mercury in fish tissue is in the methylated form, highly toxic to man. Tests were conducted where mink were fed dietary methylmercury; 5ppm were lethal within one month to adult mink. Mercuric chloride, the inorganic form, was not toxic at the 10ppm level. Most likely this is because the organic form easily penetrates the brain whereas the inorganic form is excreted from the body. EFFECT OF WATER SALINITY ON THE INCIDENCE OF POSTHODIPLOSTOMUM INFECTION IN FISH, (IN RUSSIAN),
Ukrainian Research Inst. of the Fish Industry, Kherson (USSR).
V. I. Kozlov.
Gidrobiol Zh. Vol 8, No 3, p 112-113, 1972.
Identifiers: Anisus-contortus, Fish, *Infection(Posthodiplostomum), *Posthodiplostomum-cuticola, *Salinity, *Mollusks, *Pathogenic bacteria.

Increased salinity was tested as a means of eliminating the mollusk Anisus contortus, the intermediate host of the pathogen Posthodiplostomum cuticola, from ponds. Water from the Gorki Estuary with a salinity level of 32.2% was added to a vimba-shemaia breeding pond. In 10 days the salinity decreased from 17.0 to 16.0 g Cl/1; in 20 days it further decreased to 13.0 g Cl/1. A cyclone caused the pond to overflow submerging the aquatic flora where many mollusks were concentrated. Within 35 days no live mollusks were found. In the following year, the incidence of Posthodiplostomum infection decreased from 70% to 10%.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: Energetics, *Host-parasite relationships, *Leech, Malmiana-nuda, Myoxocephalus-scorpius, *Sculpin(Shorthorn), *Fish parasites, Metabolism.

The energy budget for two groups of sculpin, M. scorpius (L.) was balanced at 10C. An accurate estimate of weekly energy expenditure could be made by calculating the metabolic energy, measuring the waste production and measuring the energy incorporated into new tissue. There was no significant difference between the summed components of energy expenditure and weekly energy input. There was a significant difference between estimated and observed energy expenditure of fish parasitized with a known weight of the leech M. nuda Richardson. This difference was proportional to the biomass of parasites and equal to 2240 cal/g of leech. The resting energy consumption of the leech was estimated from measurements of resting consumption. Stored energy was estimated by measuring the amount of blood in the gut of regularly fed leeches. The data suggest that a leech continuously fed would absorb 1600 cal of energy per week. The ratio of energy loss from the host to energy expenditures of the parasite probably is an indication of the degree of adaptation of the system. A well-adapted host-parasite relationship would exert a metabolic demand which is little more than the energy requirements of the parasite.--Copyright 1973, Biological Abstracts, Inc.

CARCINOGENIC SOURCES IN FISH TUMORS FOUND IN THE FOX VALLEY WATER SHED,
Illinois Benedictine Coll., Lisle.
J. J. Hazdra, E. R. Brown, J. Baudendistel, T. Arndt, and L. Keith.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 350-355, 1974. 3 charts, 1 tab, 5 ref.

Descriptors: *Water pollution effects, *Fish diseases, *Illinois, *Canada, Animal pathology.
Identifiers: *Fox River(Ill), *Fish tumors, Carcinogens.

The fish populating the polluted Fox River system of Illinois have a higher frequency of tumors than the same species present in non-polluted Canadian rivers. The frequency was higher from May to October. This seems to correspond to the seasonal bacterial variation in pollution and bacterial count. The main variation in the 2 sites is the chemical nature of the water. As water pollution increased there is a corresponding increase in neoplastic disease in the fish population. ZINC TOXICITY IN HYDROPONIC CULTURE,
Guelph Univ. (Ontario). Dept. of Genetic Botany.
W. E. Rauser.
Can J Bot. Vol 51, No 2, p 301-304, 1973. Illus.
Identifiers: *Beans, *Corn(Field), Cortical cells, *Hydroponic culture, Phenolics, Pollutants, Soil, *Soybeans, *Toxicity, *Zinc.

The symptoms of zinc toxicity in beans, soybeans, and corn are described. In beans and soybeans these include the deposition of a red-brown pigment in parenchyma cells of the cortex, xylem, and phloem of veins, petioles, and stems. The pigment fills some parenchyma cells completely but is confined to the cell walls of others. The xylem vessel lacunae remain free of the pigment. Extensive disorganization of cortical cells is evident in veins. The pigment is suspected to be a polyphenolic substance of unknown biochemical origin.--Copyright 1973, Biological Abstracts, Inc.

SULPHAMERAZINE TOXICITY IN CUTTHROAT TROUT BROODFISH SALMO CLARKI (RICHARDSON),
Bureau of Sport Fisheries and Wildlife, Bozeman, Mont. Fish Cultural Development Center.
C. E. Smith, J. E. Holway, and G. L. Hammer.
J Fish Biol, Vol 5, No 1, p 97-101. 1973. Illus.
Identifiers: *Cutthroat trout, Fish pathology, Hemorrhage, Kidney, Mortality, Salmo-clarki, *Sulfamerazine, *Toxicity, Water pollution effects, Broodfish.

Treatment of cutthroat trout broodfish with sulphamerazine at 220 mg/kg (10 g/100 lb) of fish/day for 14 days resulted in severe kidney histopathology and increased mortality among males. Experimental data presented showed that the cutthroat trout broodfish were extremely sensitive to sulphamerazine toxicity. Hydropic degeneration of renal tubule epithelium and hemorrhage into tubule lumens were observed in kidneys of both male and female trout, but was more severe in the former. Death, which occurred only in males, was correlated with spawning stress and impaired renal function.--Copyright 1973, Biological Abstracts, Inc.

FISH TOXICITY SURVEY OF FOUR PRAIRIE PROVINCE PULP MILL EFFLUENTS,
Department of the Environment, Winnipeg (Manitoba). Fisheries and Marine Services.
J. S. Loch, and J. C. MacLeod.
Canadian Department of the Environment, Fisheries and Marine Services, Technical Report Series No CEN T-73-4, Feb 1973, 19 p, 1 tab, 10 ref.

Descriptors: *Toxicity, *Pulp wastes, *Bleaching wastes, *Bioassay, *Fish, Canada, Effluents, Pulp and paper industry, Water pollution sources, Industrial wastes.
Identifiers: Kraft mills, Newsprint mills, Static tests, Dynamic tests.

Rainbow trout were exposed to various concentrations of effluents from four Canadian pulp mills under either static or flow-through conditions. Effluents from the bleached kraft mill of Prince Albert Pulp Co. (Saskatchewan) showed little acute toxicity at 65 and 100% concentrations under static or dynamic test conditions, fish survivals exceeding 80%. Effluent from another bleached kraft mill (North West Pulp and Power Ltd., Hinton, Alberta), however, was significantly toxic. At 32% concentration it was lethal to 50% of all fish within 96 hr; in 65% concentration, even treated effluent assured only 10% fish survival under flow-through conditions. Extreme toxicities (less than 15% LC50) were found in both static and dynamic bioassays for effluents from an unbleached kraft pulp mill (Churchill Forest Industries, Pas, Manitoba) and from an integrated newsprint mill (Abitibi Manitoba Paper Co., Pine Falls, Manitoba). The effluent-treatment facilities at each of the four mills studied are outlined. (Witt-IPC)

FACTORS AFFECTING ACUTE TOXICITY BIOASSAYS WITH PULP MILL EFFLUENT,
Department of the Environment, Winnipeg (Manitoba). Dept. of Fisheries and Marine Services.
J. S. Loch, and J. C. MacLeod.
Canadian Department of the Environment, Fisheries and Marine Services, Technical Report Series No CEN-T-74-2, 1974, 37 p, 6 fig, 3 tab, 11 ref, append.

Descriptors: *Toxicity, *Bioassay, *Pulp wastes, *Fish behavior, Analytical techniques, Aeration, Oxygenation, Waste water treatment, Rainbow trout, Trout, Water pollution effects.
Identifiers: Kraft mills, Process variables, Dynamic tests, Static tests.

In studies of the influence of some basic bioassay parameters on the 96-hr acute toxicity values of pulp mill effluent against rainbow trout, flow-through techniques were found to be much more sensitive and replicable than static bioassays. The test temperature also affected the results, high temperatures yielding greater toxicity values. Proper assessment required minimum exposure periods of 96 hr. Aeration did not diminish acute toxicity under flow-through condicions, compared to nonaeration and oxygenation. The measured toxicities of pulp mill effluents varied between different mills, even after secondary treatments. Some toxicity fluctuations, though not excessive, were also found between different samples of the same effluent. (Witt-IPC)

LABORATORY AND CONTROLLED EXPERIMENTAL STREAM STUDIES OF THE EFFECTS OF KRAFT EFFLUENTS ON GROWTH AND PRODUCTION OF FISH,
National Council of the Paper Industry for Air and Stream Improvement, Inc., New York.
C. E. Warren.
NCASI Stream Improvement Technical Bulletin, No 259, Oct. 3, 1972, 93 p. 42 fig, 12 tab, 24 ref, 2 appendices.

Descriptors: *Water pollution effects, *Toxicity, *Fish, *Aquatic fauna, *Pulp wastes, *Waste water treatment, Effluents, Pulp and paper industry, Pacific Coast Region, United States, Salmon, Trout, Snails, Biodegradation, Aquatic life.
Identifiers: Kraft pulp mills.

Results are summarized of a six-year study of the effects of untreated vs. treated kraft pulp and paper mill effluents on the fish production of complex aquatic communities under controlled natural conditions. The fish used in these studies included salmon and trout species of both commercial and recreational importance in the West Coast region. The observed and reported effects include both adverse and relatively harmless influences of kraft mill discharges. They take into account snail and other aquatic populations that serve as fish food, and may serve as illustrative guidelines for the toxicity-reducing efficiencies of various waste water treatment systems, including primary and secondary or biological processes. POTENTIAL EFFECTS OF THERMAL DISCHARGES ON AQUATIC SYSTEMS,
Washington, Univ., Seattle. Dept. of Civil Engineering.
R. M. Bush, E. B. Welch, and B. W. Mar.
Environmental Science and Technology, Vol 8, No 6, p 561-568, June 1974. 1 fig, 7 tab, 35 ref.

Descriptors: *Aquatic fauna, *Fish, *Thermal pollution, *Water pollution effects, *Cooling water, *Water temperature, Discharge(Water), Rivers, Freshwater, Sea water, Aquatic animals, Invertebrates, Water pollution sources, Sites, Freshwater fish, Marine fish, United States, Mississippi River, Delaware River, Tennessee River, Columbia River.
Identifiers: *Sacramento River.

Ecological changes in the aquatic environment caused by temperature increases are estimated, in order to aid decisionmaking in the siting of cooling water discharges. Principal consideration is given to the fish community, for which predictions of change in composition are based on lethal and preferred temperature. Six representative river systems of the U.S. are considered, viz., the Columbia, Sacramento, Delaware, Tennessee, and Upper and Lower Mississippi Rivers. Insufficient data precluded similar estimations for communities of freshwater invertebrates, but available evidence indicates that adequate protection of fish species will provide similar shelter to other fauna. Hence estimated effects of thermal pollution on freshwater fish can suffice as a guideline for overall protection of aquatic fauna. Similar predictions for marine communities were not feasible, due to lack of thermal requirement data on seawater organisms. Existing data and site studies are summarized for use in guidelines. THE PHOSPHORUS STATUS OF EUTROPHIC LAKE SEDIMENTS AS RELATED TO CHANGES IN LIMNOLOGICAL CONDITIONS--TOTAL, INORGANIC AND ORGANIC PHOSPHORUS,
Battelle-Pacific Northwest Lab., Richland, Wash.
R. E. Wildung, R. L. Schmidt, and A. R. Gahler.
Journal of Environmental Quality, Vol 3, No 2, p 133-138, April-June, 1974. 2 fig, 3 tab, 19 ref.

Descriptors: Sampling, *Phosphorus, *Sediments, *Eutrophication, *Lakes, Carbon, *Nitrogen, Organic matter, Phytoplankton, Runoff, Biological communities, Surface waters, Turbidity, Water pollution effects, *Oregon, *Lake sediments.
Identifiers: Biological growth, *Upper Klamath Lake(OR).

The role of sediments as a source of phosphorus to lake waters and the factors which may influence sediment phosphorus release were studied. Changes with time in the phosphorus status of noncalcareous sediments of a eutrophic lake were related to changes in sediment carbon and nitrogen, surface water composition, pH, temperature, and phytoplankton growth. Sediment phosphorus status and the relationship of these changes to limnological conditions differed with locations in the lake. Changes in sediment composition were greatest in a bay which received agricultural runoff in the early spring, additional nutrients apparently providing the initial impetus for increased surface water biological activity. This was reflected in increased surface water organic carbon and nitrogen, turbidity, and phytoplankton growth. At this location, total sediment phosphorus, carbon, and nitrogen decreased during the late spring and early summer, corresponding to the period of exponential growth of the lake phytoplankton population. Results indicate that sediment inorganic phosphorus is directly related to the biological productivity of the surface waters, and in at least one location, sediments serve as a significant source of phosphorus to these waters supporting increased biological growth. ADVANCED WASTE TREATMENT PROCESS SELECTION, PART THREE,
Culp, Wesner, Culp-Clean Water Consultants Corona Del Mar, Calif.
G. L. Culp, and C. L. Hamann.
Public Works, Vol 105, No 5, p 71-74, May, 1974. 3 fig.

Descriptors: Ammonia, *Chlorination, *Ion exchange, *Suspended solids, Treatment facilities, Coagulation, Filtration, *Wastewater treatment, Nitrogen, Chlorine, Cold, Disinfection, Zeolites, Pilot plants, Phosphorus, *Tertiary treatment, Hydrogen ion concentration.
Identifiers: *Ammonia removal, Solids removal, Breakpoint chlorination.

As part of a study of modification of existing waste water treatment plants to meet higher effluent standards with respect to discharge of suspended solids and aquatic growth nutrients such as nitrogen and phosphorus, a discussion is presented of ammonia stripping, chlorination, ion exchange, and solids removal by coagulation/filtration processes. Ammonia stripping is the only one of the three physical-chemical techniques which has been actually tried on a full plant scale. The process consists of raising the pH of water to 10.8 to 11.5; forming and reforming droplets in a stripping tower; and providing air-water contact and droplet agitation by circulation of large quantities of air through the tower. This method is effective and reliable for nitrogen reduction in climates which are not too cold. For areas of cold weather, other methods such as breakpoint chlorination are necessary. In this method, chlorine is added to waste water containing ammonia nitrogen and reacts with hypochlorous acid to produce chloramines. Six United States plants are planning to use this process. Its advantages are low capital costs, assurance of disinfection, and conversion of ammonia to elemental nitrogen with no disposal problem. Disadvantages are the large increase in total dissolved solids. Selective ion exchange uses zeolites which are selective for ammonia relative to calcium, magnesium, and sodium. It is still in the pilot stage but seems to remove nitrogen without adding objectionable quantities of other materials, and is effective in cold weather. (Prague-FIRL)

South Dakota Univ., Vermillion. Dept. of Biology.
T. C. Modde, and J. C. Schmulbach.
Proceedings South Dakota Academy of Science, Vol 52, p 118-126, 1973. 3 fig, 1 tab, 6 ref. OWRR B-024-SDAK(2).

Descriptors: *Aquatic insects, *Aquatic drift, *Benthic fauna, *Invertebrates, Missouri River, South Dakota, Channel morphology, Standing crops, Seasonal, Diptera, Mayflies, Caddisflies, Systematics, Metabolism, Life cycles, Water level fluctuations.
Identifiers: Trichoptera, Hydropsyche.

Seasonal changes in the taxonomic and quantitative composition of the drift and benthic macroinvertebrates were investigated. Monthly samples were randomly taken from the main channel of the Missouri River at dusk. Drift organisms were collected at the water's surface with a fry net and seasonal variations in both the standing crop and taxonomic diversity were observed. Caddisfly larvae, primarily Hydropsyche spp., dominated the drift macroinvertebrates during the period between October and February. Dipteran larvae, pupae and adults constituted more of the drift standing crop between March and May. During the summer, June through September, the three principal taxa, Chironomidae, Hydropsychidae and Ephemeroptera all increased in the drift samples with neither group dominating during the period. The total benthic biomass also increased during the summer. Little similarity was observed in the taxonomic composition of the drift and benthic communities, with a much greater diversity of organisms found in the drift. The main factors affecting the quality and quantity of the drift fauna were temperature and its effect upon metabolism, life cycle of the insects, and time and rates of water discharge at the Gavins Point Dam. (Jones-Wisconsin)

A COMPARISON OF THE MACROINVERTEBRATE AUFWACHS IN THE UNSTABILIZED AND STABILIZED MISSOURI RIVER,
South Dakota Univ., Vermillion. Dept. of Biology.
A. E. Nord, and J. C. Schmulbach.
Proceedings South Dakota Academy of Science, Vol 52, p 127-139, 1973. 4 tab, 23 ref. OWRR B-024-SDAK(3).

Descriptors: *Periphyton, *Invertebrates, Missouri River, Channel morphology, Systematics, Standing crops, Mayflies, Diptera, Caddisflies, Aquatic insects, Lentic environment, Lotic environment, Benthic fauna.
Identifiers: Trichoptera, Simulium.

Taxonomic composition and standing crop of aufwuchs (all organisms except macrophytes which live attached to substrate) and differences between aufwuchs in stabilized and unchannelized portions of the Missouri River were determined. The samplers used to collect organisms consisted of 'masonite' plates bolted together with spacers so that 9.29 sq dia of substrate was provided for aufwuchs colonization. Samplers were suspended approximately 60 cm below the water's surface for 32 days. All organisms were identified to the lowest possible taxon, usually the generic level. Statistical analyses were accomplished with the aid of an IBM computer using a multivariate analysis program. The basic taxonomic composition of the aufwuchs varied only slightly between stations. The caddisflies, Hydropsyche and Neureclipsis, dominated the aufwuchs on both a standing crop and numerical basis. There were striking differences between fast- and slow-water samplers at each station: slow-water samplers had greater species diversity while fast-water samplers had larger standing crops. Aufwuchs preferring fast-water velocities were Hydropsyche, Baetis, Heptagenia, and Simulium. Slow-water was preferred by Neureclipsis and one or more genera of Caenidae. The unchannelized Missouri River with its diverse habitat types is a better producer of macroinvertebrates than the channelized portion. (Jones-Wisconsin)

A METHOD FOR RAPID IDENTIFICATION OF TYPHOID AND DYSENTERY BACTERIA IN WATER,
Institute of General and Municipal Hygiene, Moscow (USSR).
M. G. Kichenko, and Y. G. Talayeva.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-773 902, $4.00 in paper copy, $2.25 in microfiche. Translated from Akademiya Meditsinskikh nauk USSR, Voprosy Sanitarnoy Bakteriologii i Virusologii, p 166-170, 1965. Air Force Systems Command, Translation Division, FTD-HT-23-519-74, January 1974. 9 p.

Descriptors: *Pathogenic bacteria, *Water analysis, *Analytical techniques, Bioassay, Enteric bacteria, Coliforms, Cultures, Systematics.
Identifiers: Typhoid, Dysentery.

Use of fluorescent sera for early rapid diagnosis of pathogenic coliform bacteria gave good results with pure cultures, but not with mixed cultures. This method is promising only with organisms with a clearly defined antigen structure (Vibrio cholerae, plague bacilli, anthrax bacilli and other dangerous causative agents). However, pathogens of the enterobacteriaceae family are similar in their antigenic nature to various saprophytic bacteria thus fluorescent sera can be of limited use as a rapid method for determining pathogenic bacteria. A combination of methods for shortening bacteriological water analysis give results in 18 hours. In addition to direct methods for isolating pathogens from water, indirect methods in an external medium are being used based on different bacterial properties or chemical composition. Thus, precipitation reaction with hapten in a mixed culture is based on the multisugar complex of pathogens to give a precipitative reaction with specific sera. As an indirect index of infectiosness, use of the ability of a specific (indicating) bacteriophage to multiply only in cells of the corresponding group of pathogens is proposed. These direct methods do not preclude the need for further development of rapid bacteriological methods for direct isolation of pathogenic bacteria. (Jones-Wisconsin)

BIOGEOCHEMISTRY OF A RESERVOIR ECOSYSTEM,
Oklahoma State Univ., Stillwater. Dept. of Chemistry; Oklahoma State Univ., Stillwater. Dept. of Zoology; and Oklahoma State Univ., Stillwater. Reservoir Research Center.
L. P. Varga, D. W. Toetz, and T. C. Dorris.
Available from the National Technical Information Service, Springfield, Va 22161. $4.25 in paper copy, $2.25 in microfiche. Report No 4, September 1, 1972 to June 1, 1973. (ORO-4254-14). 41 p, 5 fig, 15 tab, 15 ref. AEC AT-(40-1)-4254.

Descriptors: *Nitrogen, *Nitrates, *Absorption, *Diurnal, Mathematical models, Analytical techniques, Temperature, Measurement, Oklahoma, Phosphorus, Carbon, Chlorophyta, Chlorella, Cyanophyta, Carbon dioxide, Spectrometers, Phenols, Solar radiation, Biochemistry, Geochemistry.
Identifiers: *Lake Carl Blackwell(OK).

A computation model to predict uptake of nitrate given data on substrate concentration, light, temperature, and cellular nitrogen was developed and evaluated by comparing observed and predicted uptake in Lake Carl Blackwell, Oklahoma. Diel periodicity in nitrogen deficiency was not detected. Nitrite uptake by plankton was observed over a diel period in situ. Nitrite was assimilated both in the dark and the light, but the dark rate was lower by a factor of two. Observations were completed on precision of an in situ method to derive Michaelis-Menten constants for nitrate uptake. Nitrogen, phosphorus, and organic carbon additions, and aeration were applied to water isolated in polyethylene columns. Aeration in columns did not significantly reduce algal numbers. Sedimentary phosphorus was released by stirring and increased algal growth. A laboratory experiment demonstrated which forms of algae overwintered in the sediments. A green and a blue-green alga were monitored simultaneously in laboratory cultures under conditions of low pH, bubbled carbon dioxide, and added nitrogen and phosphorus to evaluate their competitive ad-

vantage. Both species grew at the same rate in filtered lake water and in filtered water with nutrients added. (Jones-Wisconsin)

OIL POLLUTION AND MARINE ECOLOGY,
University Coll. of Swansea (Wales). Dept. of Zoology.
A. Nelson-Smith.
Plenum Press, New York, 1973. 260 p, 52 fig, 20 tab, 694 ref.

Descriptors: *Oil pollution, *Marine biology, *Ecology, Water pollution effects, Ships, Pollutants, Toxicity, International waters, Harbors, Physical properties, Chemical properties, Oil spills, Plankton, Fish, Benthic fauna, Plant populations, Birds, Mammals, Biological communities, Economics, Fisheries, Tourism, Hazards, Emulsions, Dispersion, Sedimentation, Biodegradation, Water pollution sources, Shores, Oil industry, Water pollution control, Diseases.

Technical publications on oil pollution are so numerous that many environmental scientists remain ignorant of its main causes and best cures. This volume combines important features of technical and biological literature, and indicates to industrialists and administrators some complexities of life in the sea and the less direct effect pollution may have on marine ecosystems. Additional stresses imposed by pollution in the marine environment may be determining factors in eliminating localized species from fringes of their range. The usual and most obvious effect of pollution is to reduce diversity. Common pollutants are listed. The petroleum industry has grown with development of tank shipping, which with other shipping and marine terminals and harbors, contribute to oil spills. Spilt oil is examined with reference to its physical and chemical characteristics, behavior at sea, oil carried to the strandline at high-water mark, detection, identification and analysis, and carcinogenesis. Oil effects on marine organisms--plankton, fish, benthic invertebrates, attached plants, birds and mammals is presented, and its effects on populations or communities, and rehabilitation of oiled birds. Economic aspects, fisheries, tourist industry, hazards to life and property are considered. Recommended methods for removing spilt oil complete the book. (Jones-Wisconsin)

THE EFFECT OF CUSO4 ALGICIDE DOSES UPON THE ROUTINE METABOLISM OF COMMON CARP (CYPRINUS CARPIO L.) AND PRUSSIAN CARP (CARASSIUS AURATUS GIBELIO (BLOCH)), (IN RUMANIAN),
Academia R. S. R., Bucharest. Institutul de Biologie.
E. Leonte.
Bul Cercet Piscic. Vol 31, No 1/2, p 137-144. 1972. Illus. English summary.

Descriptors: *Copper sulfate, *Algicides, Carp.
Identifiers: Carassius auratus-gibelio, Cyprinus carpio.

The effects of 0.7, 0.5, 0.3 and 0.1 mg CuSO4/1 solutions (algicide doses) on the routine metabolism of common carp (C. carpio) and prussian carp (C. auratus gibelio) were investigated. Algicide doses of CuSO4 had a lethal action on these 2 species. The responses of O2 uptake to toxic actions of CuSO4 solutions had 3 phases: an immediate response, in the first min after exposure to the toxic compound; a stabilization phase in which O2 consumption remained fairly constant; and a third phase, which was characterized by the establishment of asphyxia. Values of routine O2 consumption and duration of phases were dependent upon concentrations of CuSO4 solutions. Death occurred by asphyxia when tissues of gills were damaged and O2 requirements could not be compensated by increase of gill ventilation.--Copyright 1974, Biological Abstracts, Inc.

THE INFLUENCE OF THE EUTROPHIC PROCESS OF WATERS BY ERODED SOIL MATERIAL, (IN GERMAN),
H. Wiechmann.
Landwirtsch Forsch. Vol 26, No 1, p 37-46. 1973. English summary.

Descriptors: *Eutrophication, Phosphates, Suspension, Soil erosion.

In order to determine to what extent eroded soil material can increase the eutropic process of waters by P the reaction of P-dissolution and P-sorption within soil suspensions (Ap-horizons of Loess-soils) with the fractions < micro, < 6 micro and < 20 micro was tested. From total phosphate dissolved out of the suspended soil material during 2-48 hr, approximately 50-67% originate from the P-content of the clay fraction although the suspended P-reserves were almost the same in all 3 grain fractions. The maximum of the dissolved P-shares from the grain fractions was obtained after 2 hr (3-8% from the silt fractions, 11-14% from the clay fraction). Prolongation of the reaction-time only influences the P-solution rate within the silt fractions. The dissolved P-share decreases with the increase of suspended soil with same grain distribution. Concerning the eutropic process of P the phosphates of the clay fraction are of special importance because of high and rapid solubility. Water containing Ca(HCO3)2 used as means of suspension resulted in lower as well as higher P-dissolution rates compared with water, supposedly due to dependence on the binding of P (Ca-phosphate respectively Al + Fe-phosphate) and on their dissolution reactions. However, a clear relationship could not be found. In suspensions with P-containing sewage the P-sorption dominated a possible P-desorption in all tested P-concentrations. The clay fraction is of outstanding importance for the P-binding. Eroded soil material in some cases can lower the risk of eutropic processes by acting as a 'third refinement stage.'--Copyright 1974, Biological Abstracts, Inc.

ENVIRONMENTAL EFFECTS OF PETROCHEMICAL WASTE DISCHARGES ON TALLABOA AND GUAYANILLA BAYS, PUERTO RICO,
Environmental Protection Agency, Athens, Ga. Surveillance and Analysis Div.
M. D. Lail, R. G. Rogers, and M. R. Weldon.
Available from NTIS, Springfield, Va 22161 as PB-215 622, Price $3.00 printed copy; $2.25 microfiche. Technical Study TS-03-71-208-02, October 1971. 102 p, 21 fig, 10 tab, 28 ref, 7 append.

Descriptors: *Water pollution effects, *Bays, *Puerto Rico, Oily water, *Oil pollution, Water pollution sources, Water temperature, Eutrophication, Algae, Chemical wastes, Thermal pollution.
Identifiers: Tallaboa Bay(PR), Guayanilla Bay(PR).

Petrochemical wastes and once-through cooling water discharged into Tallaboa Bay and once-through cooling water discharged by the South Coast Steam Plant into Guayanilla Bay caused violations of Puerto Rico's water quality standards. Dissolved oxygen concentrations in western Tallaboa Bay are below the 4.5 mg/liter minimum requirement. Water temperatures in western Tallaboa Bay and eastern Guayanilla Bay are in excess of the 4 deg F rise permitted. Organic sediment deposits in Tallaboa and Guayanilla Bays contain petrochemical residues. Visible oil and floating solids contaminate western Tallaboa Bay. Standing crop and diversity of the community of macroinvertebrate organisms inhabiting Tallaboa and Guayanilla Bays are reduced. Corals are destroyed by the depositions of oil and detritus in western Tallaboa Bay. Unsightly nuisance growths of filmamentous green algae of the genera Cladophora and Enteromorpha are found along the shorelines of Tallaboa and Guayanilla Bays. (Knapp-USGS)
W74-11228

EFFECT OF WASTE MANAGEMENT AND EGG PROCESSING ON THE FLAVOR OF COOKED EGGS,
Cornell Univ., Ithaca, N.Y. Dept. of Poultry Science.
K. R. Nath, J. M. Darfler, and R. C. Baker.
Poultry Science, Vol 52, No 3, p 1178-1185, May, 1973. 3 fig, 6 tab, 9 ref.

Descriptors: *Farm wastes, *Poultry, Environment, Hydrogen sulfide, *Odor, Effects.
Identifiers: *Eggs, *Flavor, Processing, *Waste management, Cryovac bags, Egg storage, Albumen, Yolk.

Four different chambers used for handling manure were compared in a study undertaken to evaluate the effect of environmental odors on the flavor of soft cooked eggs. Soft cooked eggs were prepared by immersing eggs in boiling water for four minutes. Hard cooked eggs were prepared by heating eggs for 20 minutes in water at 93C. Some hard cooked eggs were stored in shells while other were peeled and packaged in Cryovac bags. All storage studies were done at 5C. Hen-house environment has no effect on the flavor of soft cooked eggs. In hard cooked eggs, the flavor quality of both albumen and yolk deteriorated at one week. When eggs were peeled and packaged in Cryovac bags albumen did not deteriorate as rapidly as eggs stored in shells. The loss of hydrogen sulfide from cooked eggs is responsible for the loss of egg flavor. (Cartmell-East Central)

EFFECT OF CATTLE FEEDLOT VOLATILES, ALIPHATIC AMINES, ON CHLORELLA ELLIPSOIDEA GROWTH,
Agricultural Research Service, Fort Collins, Colo.
A. R. Mosier.
Journal of Environmental Quality, Vol 3, No 1, p 26-28, January-March, 1974. 1 fig, 3 tab, 10 ref.

Descriptors: *Feed lots, *Volatility, Algae, Toxicity, Nitrogen, Ammonia, Effects, *Farm wastes.
Identifiers: *Aliphatic amines, *Chlorella Ellipsoidea, Methyl, Dimethyl, Ethyl, Diethyl, N-propyl, Iso-propyl, N-butyl, Sec-butyl, Dialkylamines.

The purpose of this study was to determine the effect of individual aliphatic amines that have been identified as feedlot volatiles on chlorella ellipsoidea. The amines tested were methyl, dimethyl, ethyl, diethyl, n-propyl, iso-propyl, n-butyl, and sec-butyl. Individual aliphatic amines caused a 50% reduction in population growth of chlorella ellipsoidea at concentrations ranging from 1.2 to 143 ppm amine-N. The more closely the amine structurally resembles ammonia, the greater the inhibitory effect. The primary amines were more toxic than the sec-, iso-, or the dialkylamines. The algae could not utilize any of the amines as N sources either in the presence of adequate N or under N-deficient conditions. (Cartmell-East Central)

THE DISTRIBUTION AND SUCCESSION OF AQUATIC VASCULAR PLANT COMMUNITIES IN RELATION TO PHYSICAL-CHEMICAL CHARACTERISTICS OF VARIOUS LAKES AND PONDS OF THE TANANA VALLEY, CENTRAL ALASKA,
Alaska Univ., College. Inst. of Water Resources; and Alaska Univ., College. Inst. of Marine Science.
L. D. LaPerriere, and B. R. Robertson.
Termination Report, September 1973. 17 p. 1 fig, 9 tab. OWRR A-011-ALAS(1).

Descriptors: *Alaska, *Aquatic plants, *Distribution, *Succession, Physical properties, Chemical properties, Lakes, Ponds, Bottom sediments, Algae, Soil analysis, Water quality, Temperature, Oxygen, Carbon dioxide, Alkalinity, Nitrites, Sulfates, Turbidity, Hydrogen ion concentration, Phosphates, Weather, Organic matter.
Identifiers: *Tanana Valley(AK), Harding Lake(AK), Little Lake(AK).

This report consists of one figure showing the morphometry of Harding and Little Lakes in central Alaska with sampling station locations. The station characteristics are summarized in nine tables regarding the texture of bottom materials (in percentage according to depth) and organic matter content of bottom materials (percentage dry weight), according to depth and station. The species of aquatic vascular plants, algae, and liverwort, occurring in Harding Lake in the summer of 1966 are listed showing the number and dry weight of the plant collections, arranged by station. The occurrence of plant species in quadrat (1 sq m) samples are listed by number and dry weight. The soil analysis data are arranged by plant stand and by plant species. At one station the water quality parameters--temperature, oxygen, carbon dioxide, alkalinity, nitrites, sulfates, turbidity, pH, phosphates and weather--are analyzed. (Jones-Wisconsin)

INFLUENCE OF ORGANIC POLLUTION ON LAKE MARIUT, A HIGHLY EUTROPHICATED LAKE SOUTH OF ALEXANDRIA,
Alexandria Univ. (Egypt). Dept. of Oceanography.
M. A. H. Saad.
In: Revue Internationale d'Oceanographie Medicale, Vol 34, p 23-36, 1974. 3 fig, 1 tab, 20 ref.

Descriptors: *Water pollution effects, *Water pollution sources, *Organic wastes, *Eutrophication, Dissolved oxygen, Environmental effects, Sewage, Industrial wastes, Domestic wastes, Decomposing organic matter, Aquatic environment, Water chemistry, Hydrogen sulfide, Phytoplankton, Freshwater.
Identifiers: *Lake Mariut(Egypt).

Lake Mariut was considered a highly fertile lake until recent years. Increasing population and industry have caused intensive pollution and extreme deterioration of this lake. The decrease in the total fish catch from 9,977,815 kg in 1961 to 1,490,600 kg in 1969 is due principally to the lake pollution. Lake Mariut receives great amounts of untreated domestic sewages and industrial wastes which are enriched with allochthonous organic matter. The phytoplankton blooms, which flourish under favorable conditions, supply the lake with considerable amounts of autochthonous organic materials. Water samples were collected from five different localities of the lake and also from the Qala Drain at its connection with the lake. Concentrations of the dissolved organic matter were established. The maximum value of the organic content of Lake Mariut reached 19.80 mg O2/l in October. The environmental conditions are favorable for the decomposition of great amounts of this organic matter and result in a great decrease in the dissolved oxygen in this lake. Further decomposition of organic matter occurs anaerobically resulting in the production of decomposition gases, particularly hydrogen sulfide. Drainage waters enter the lake more or less continuously and mex-pumps discharge surplus water from the lake into the sea. The polluted lake water, rich in organic matter, may affect the Mediterranean coastal water to the north of Lake Mariut. This influence has not been studied. (Katz)

THE EFFECT OF POLLUTED WATER ON THE ASSIMILATION RATE OF THE BROWN ALGAE ASCOPHYLLUM NODOSUM (L.) LE JOL. AND FUCUS VESICULOSUS (L.) (PRELIMINARY EXPERIMENT),
Institut za Biologijo Sazu, Ljubljana (Yugoslavia).
I. Munda.
In: Revue Internationale d'Oceanographie Medicale, Vol 34, p 53-66, 1974. 2 fig, 1 tab, 29 ref.

Descriptors: *Salinity, *Organic wastes, *Algae, *Distribution, Littoral, Water pollution effects, *Phaeophyta, Aquatic plants, Sewage, Domestic wastes, Methodology, Oxygen, Respiration, Metabolism, Primary producers, Bioassay.
Identifiers: *Fucoids, *Fucus vesiculosus, *Ascophyllum nodosum, Oxygen production, Oxygen consumption, Assimilation rates, Chemical composition.

Studies of the polluted areas of Nordasvatnet in Western Norway revealed that the dominant eulittoral fucoids, A. nodosum and F. vesiculosus, avoid habitats polluted by sewage though salinity conditions would still permit their occurrence. Preliminary experiments studied the effects of organic pollution on the assimilation rate of F. vesiculosus and of A. nodosum, under constant salinity conditions. Polluted water from the inner area of Nordasvtnet was used as medium and the control samples were kept in unpolluted water. In another series of experiments, bacterial and plankton respiration was cut off by means of sterilization and the biggest organic particles were removed by filtration. Oxygen production was found in the control samples and oxygen consumption in the other samples. Results indicated that certain components in the sewage exert a negative influence upon the metabolic activity of the two fucoids, even after bacterial activity had been terminated. F. vesiculosus seems more susceptible than A. nodosum. The results of the preliminary experiments apparently contradict the spatial distribution of the two species in polluted areas, where F. vesiculosus protrudes longer in the neighborhood of sewers than A. nodosum. The distribution in the field seems salinity-conditioned and is in accord with the greater resistance of F. vesiculosus towards dilution. It seems probable that in the vicinity of sewers the influences of organic pollution prevail over the influence of the salinity factor. (Katz)

SOME RESPONSES OF PLANKTONIC ORGANISMS TO ENVIRONMENTAL POLLUTION,
Messina Univ. (Italy). Inst. of Hygiene.
P. Crisafi.
In: Revue Internationale d'Oceanographie Medicale, Vol 34, p 145-154, 1974. 10 fig, 17 ref.

Descriptors: *Copepods, *Water pollution effects, Invertebrates, Zooplankton, Crustaceans, Plankton, Aquatic animals, Organic compounds, Microscopy, Environmental effects, Pathology.
Identifiers: *Morphological changes, *Intestinal prolapse, Acartia ssp, Centropages ssp, Temora ssp, Paracalanus ssp, Italy, Histology.

Morphological deviations of marine and freshwater Copepods of a previously unreported nature are believed to be caused by unfit nutrients such as hydrocarbons or pabulum. These result from environmental changes. Histological investigations show this to be an intestinal prolapse. The muff-shaped appendage on anal segments was found on female Acartia discaudata var. mediterranea, Acartia italica, A. clausi, Centropages humatus, Paracalanus ssp. and both sexes of Temora longicornis. The development of the appendage takes place gradually as evidenced by individual differences and lack of the appendage in some specimens. (Katz)

CHANGES AND SUCCESSION IN THE BENTHIC ALGAL ASSOCIATIONS OF SLIGHTLY POLLUTED HABITATS,
Institut za Biologijo Sazu, Ljubljana (Yugoslavia).
I. Munda.
In: Revue Internationale d'Oceanographie Medicale, Vol 34, p 37-52, 1974. 22 ref.

Descriptors: *Algae, *Benthic flora, *Water pollution effects, *Succession, Benthos, Environmental effects, Organic wastes, Vegetation establishment, Biomass, Primary productivity, Hydrography, Ecology, Salinity, Fjords.
Identifiers: *Fucus ssp, *Adriatic, Green algae, Vegetation pattern, Norway, Blidingia ssp, Pelvetia ssp, Asophyllum ssp, Halopteris ssp.

The effect of sewage on benthic algal associations was investigated in two hydrographically different areas, a land-locked fjord in Western Norway and in the surroundings of Rovinj in the Northern Adriatic. Observations indicated that the fucoids gradually disappear under the influence of sewage in both areas. In the Atlantic, however, they disappear in the following sequence: Pelvetia canaliculata, Fucus spiralis, Fucus serratus, Asophyllum nodosum, Fucus vesiculosus. They are replaced by associations of different Enteromorpha species, which seem to be prolific under the influence of slight organic pollution. In the immediate neighborhood of sewers a Blidingia minima Cyanophyceae association was left. In the Adriatic, fucoids seemed likewise to disappear from areas polluted by sewage. The Cystoseira and Sargassum associations seemed to be rather susceptible and the Fucus virsoides association less. The associations are replaced by Halopteris scoparia, which seems to represent the final stage of succession under conditions of slight organic pollution in the Adriatic, while green algae have a subordinate role in the vegetation pattern. Observations in both regions indicated that the biomass of the benthic algal settlements have decreased under the influence of organic pollution. (Katz)

Descriptors: *Path of pollutants, *Heavy metals, *Molluscs, *Food chains, Industrial wastes, Water pollution sources, Water pollution effects, Trophic, Copper, Chromium, Zinc, Lead, Mercury, Organic compounds, Ions, Bioassay, Public health, Absorption, Neritic, Effluents, Estuaries, Benthos, Analytical techniques, Methodology, Plankton, Toxicity, Laboratory tests.
Identifiers: *Biological chains, *Accumulation.

Industrial metallic by-products are disposed into the marine environment, thus, they can lead to phenomena of concentration in oceanic organisms and further on to phenomena of toxicity for the final consumer of the biological chains. Results of experiments, carried out in the laboratory, with regard to the transfers of metallic pollutants within a neritic chain with molluscs are discussed. Five metals are taken into consideration with values given for their average concentrations in various organisms. They are copper, zinc, chromium, lead, and mercury, in an ionic form or associated with organic compounds, found in effluents and in oceanic environments. The results are discussed to assess the hazards of pollution presented by activation and chemical products. (Katz)

Identifiers: Plaice, Assimilation, Carcinus maenas, Pleuronectes platessa, Hepatopancreas, Liver, Kidney.

A study was made of the passage of 60Co from the Annelid Arenicola marina to the upper trophic level constituted by the Crustacea Carcinus maenas or the Teleost Pleuronectes platessa. The absorption and the fecal, urinary and branchial excretions of 60Co were measured following the administration of contaminated food during periods from one to five months. The elimination of 60Co by crabs and plaice was monitored during six and three months respectively. Assimilation of radioactive and stable cobalt found as a carrier in the contaminated food varied according to the species; assimilation rates were high in C. maenas and very low in P. platessa. Cobalt isotopes were mainly retained in the hepatopancreas of crabs and in the liver and kidney of plaice. The high concentrations of 60Co in these organs could result in very high but partial internal exposures. They are long-term exposures since cobalt seems to be retained in an unexchangeable form. Descriptors: *Dissolved oxygen, *Metabolism, *Annelids, Analytical techniques, Methodology, Animal physiology, Respiration, Bioassay, Bioindicators, Water pollution effects, Reproduction, Analytical techniques, Biochemical oxygen demand, Oxygen, Water pollution, Biochemistry, Amino acids, Enzymes.
Identifiers: *Sublethal effects, *Survival, *Polychaetes, Neanthes arenaceodentata, MDH/LDH, Feeding, Egg production, Hemoglobin.

The effects of reduced levels of dissolved oxygen were measured on a laboratory inbred strain of the polychaete Neanthes arenaceodentata. The 28 day TLm value was 0.9 mg/1; 0.95 mg/1 was necessary to enable 50% of the animals to feed, 2.0 mg/1 was required in order to produce 50% of the normal number of eggs, and changes in the MDH/LDH, free amino acid concentrations, and hemoglobin concentration were induced at dissolved oxygen levels of 2.6, 2.7 and 4.2 mg/1, respectively. SUBLETHAL EFFECTS OF DDT ON THE BEHAVIORAL RESPONSES OF BARNACLES TO CHEMICAL AND TACTILE STIMULI,
North Carolina Univ., Morehead City. Inst. of Marine Sciences.
N. Meith-Avcin.
In: Revue Internationale d'Oceanographie Medicale, Vol 33, p 91-102, 1974. 3 fig, 23 ref.

Descriptors: *DDT, *Behavior, Water pollution effects, Biochemistry, Animal physiology, Pesticides, Larvae, Animal behavior, Methodology.
Identifiers: *Balanus ssp, *Barnacles, *Response patterns, Sublethal levels, Tactile stimuli, Chemical stimuli, Rugophilic, Nervous system, Abnormal behavior.

Barnacles of the species Balanus amphitrite were treated with sublethal levels of DDT to determine changes in their response patterns to chemical and tactile stimuli brought by DDT action to the nervous system. At treatment exposures of 10 micrograms/l for one hour, severe behavioral anomalies were observed. Lower concentrations resulted in fewer instances of anomalous behavior. Water flow induced return to normal behavior patterns in many treated individuals, suggesting that sensory rather than motor components of the nervous system are involved in the DDT effect. Treatment of glass settling with DDT generally resulted in lowered settlement densities of the cyprids of Balanus improvisus and lowered indices of preference for roughened surfaces, indicating that DDT interferes with the cyprid's rugophilic response pattern to settlement surfaces. FREE AMINO ACID VARIATIONS IN THE ANCHOVY, ENGRAULIS MORDAX (GIRARD) FROM THE LOS ANGELES COASTAL AREA,
Immaculate Heart Coll., Los Angeles, Calif. Dept. of Biology.
R. D. Schafer, and E. Swann.
In: Revue Internationale d'Oceanographie Medicale, Vol 33, p 103-110, 1974. 1 tab, 6 ref.

Descriptors: *Amino acids, *Metabolism, Biochemistry, Water pollution effects, Organic compounds, Methodology, Commercial fish, Animal physiology, Bioassay, *California.
Identifiers: *Engraulis mordax, Auto-analyser, Histidine, *Los Angeles coast(CA).

Difference in free amino-acid content in anchovies was examined to determine the affects of water pollution. Specimens from non-polluted and polluted water were collected by net. White muscle tissue was used for analyses with an auto-analyser and both qualitative and quantitative differences in amino-acid content were noted. Aspartic acid, asparagine and cystine were not present in the controls but were found in one or more of the samples from polluted waters. Histidine was present in the controls in greater quantity than in the test samples. Other quantitative differences were found in taurine, lysine and glutamic acid. (Katz)

THE EFFECT OF HEAVY METAL ON PROTEIN SYNTHESIS IN CRUSTACEANS AND FISH,
Palermo Univ. (Italy). Instituto di Istologia ed Embriologia.
V. D'Amelio, G. Russo, and D. Ferraro.
In: Revue Internationale d'Oceanographie Medicale, Vol 33, p 111-118, 1974. 3 fig, 13 ref.

Descriptors: *Crustaceans, *Proteins, *Lead, *Heavy metals, Aquatic animals, Water pollution effects, Separation techniques, Analytical techniques, Methodology, Biochemistry, Cytological studies, Metabolism, Isotopic studies.
Identifiers: *Carassius auratus, *Hemoglobin synthesis, *Eriphia spinifrons, *Ribosomes, Hepatopancreas, Aminolevilinic acid dehydrase.

Treatment of Carassius auratus with lead has been found to influence three parameters of blood cells. Hemoglobin synthesis is strongly inhibited, aminolevilinic acid dehydrase activity is reduced and cell density is affected by lead. Eriphia spinifrons was treated with lead and the hepatopancreas was examined for activity and presence of polyribosomes in protein synthesis. After 30 days in the presence of 0.3 mg/l of lead nitrate, polyribosomes were lacking indicating a reduction of protein synthesis. (Katz)

J. Verne, E. Fournier, M. Aubert, S. Hebert, and N. Richshoffer.
In: Revue Internationale d'Oceanographie Medicale, Vol 33, p 147-150, 1974. 2 ref.

Descriptors: *Metals, *Cytological studies, Cadmium, Chromium, *Titanium, *Toxicity, Enzymes, Manganese, Water pollution effects.
Identifiers: Vanadium, Hepatocytes, Mitosis, Cell culture, Titanium industry.

A study was conducted of the behavior of cellular elements in a culture which contained cadmium,

hromium, manganese, titanium and vanadium as hlorides. The cell cultures were made up of epatocytes. Toxicity was determined using the itotic index, the aspect of the cellular organelles nd the enzymic response. The tests evidenced iat cadmium was by far the most toxic metal. oth vanadium and titanium induced significant amage, while the action of manganese and hromium seemed to be very mild. (Katz)

escriptors: *On site laboratories, On site investigations, *On site tests, Water quality control, emperature, *Thermal pollution, Cooling water, nalytical techniques, Methodology, Movement, ainbow trout, Sunfishes, Bass, Catfishes.
lentifiers: *Acclimation, Salmo gairdneri, reference, Avoidance, Big-mouth chub, Small-outh bass, Northern hogsucker.

he biological assessment of industrial waste ischarges under partly controlled conditions at ie discharge site is becoming increasingly impornt in water quality control. Temperature reference and avoidance trials were conducted ith 16 fish species from six families ranging from lmonids to catfish. Fish were collected near the boratory from heated and unheated areas near ie junction of two rivers receiving thermal efuent from a fossil fuel power plant. Trials were onducted for fish acclimated at temperatures rom 30 to 12C at 3C increments. Preference temeratures decreased for all species as acclimation emperature decreased. Bass, catfish and sunfish referred the warmest temperatures while trout referred the lowest temperatures. Species that ere eurythermal were catfish and sunfish while lmonids were stenothermal. (Katz)

THE ACCUMULATION AND RETENTION OF 65ZN AND 54MN BY THE PLAICE, PLEURONECTES PLATESSA L.,
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Fisheries Radiobiological Lab.
R. J. Pentreath.
Journal of Experimental Marine Biology, Vol 12, No 1, p 1-18, 1973. 5 fig, 9 tab, 25 ref.

Descriptors: *Zinc, *Manganese, *Radioisotopes, Absorption, Retention, Bioassay, Heavy metals, Toxicity, Trophic level, Path of pollutants, Metabolism, Trace elements, Pollutants, Radioactive wastes, Teleosts, Methodology, Water pollution effects.
Identifiers: *Pleuronectes platessa, *Plaice, Biological half-time, Tissue analysis, Blood plasma.

Studies of the uptake and loss of 65Zn and 54Mn by plaice have shown that direct accumulation from water plays only a minor role relative to food in the metabolism of these metals. Accumulation of both isotopes from water was followed at tissue level and their levels of accumulation were related to stable element concentrations. Biological half-times were also calculated for accumulation and loss to water, for loss of activity following an intraperitoneal injection and, using calculations of feeding rate and assimilation of the isotopes, from food. Some comparative studies were carried out with fed and starved fish. Due to the relatively minor role of direct accumulation from water it was considered that the concentrations of these metals would decrease at this trophic level. The relevance of such observations to toxicity testing is also discussed. (See also W74-11300) (Katz)
W74-11299

THE ACCUMULATION AND RETENTION OF 59FE AND 58CO BY THE PLAICE, PLEURONECTES PLATESSA L.,
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Fisheries Radiobiological Lab.
R. J. Pentreath.
Journal of Experimental Marine Biology, Vol 12, No 3, p 315-326, 1973. 5 fig, 5 tab, 23 ref.

Descriptors: *Iron, *Cobalt, *Radioisotopes, Absorption, Retention, Heavy metals, Pollutants, Trophic level, Bioassay.
Identifiers: *Plaice, *Pleuronectes platessa, Starvation, Biological half-times.

The accumulation of 59Fe and 58Co from water by plaice has been studied in tissues, and these levels of accumulation related to stable element concentrations. The retention of both radionuclides from labelled Nereis and labelled pellets has also been examined, and the loss of activity from intraperitoneal injections followed over a three month period. Biological half-times of the exchange with water have been calculated for many organs, although the rate of accumulation for some tissues could only be expressed as a linear function; however, for both radionuclides the direct accumulation from water resulted in concentration factors of less than 1% of the values inferred from the stable element data. The relevance of such observations to heavy metal pollution at the higher trophic levels is discussed. (See also W74-11299) (Katz)
W74-11300

THE INFLUENCE OF CERTAIN TOXIC SUBSTANCES, CONTAINED IN DOMESTIC WASTES, ON THE BACTERIA ESCHERICHIA COLI AND PSEUDOMONAS FLOURESCENS, (L'INFLUENCE DE CERTAINES SUBSTANCES TOXIQUES, CONTENUES DANS LES EAUX D'EGOUTS MUNICIPAUX, SUR LES BACTERIES ESCHERICHIA COLI ET PSEUDOMONAS FLOURESCENS),
Institute of Municipal Economy, Poznan (Poland).
S. Spandowska, B. Lubienska, and S. Kolaczkowski.
Swiss Journal of Hydrology, No 2, p 278-285, 1973. 2 fig, 3 tab, 18 ref.

Descriptors: *Municipal wastes, *Escherichia coli, *Pseudomonas, *Toxicity, Waste water(Pollution), Water pollution, Water pollution sources, Water pollution effects, Lethal limit, Growth rates, Phenols, Reproduction, Metabolism, Respiration, Methodology.
Identifiers: Aniline, Pyridine, Chrome.

The toxic influence of phenol, aniline, pyridine and chrome, substances often found in municipal wastewaters, on the bacteria E. coli and P. flourescens was examined. The non-toxic, growth limiting, toxic and lethal doses were determined on the basis of observations made of E. coli and P. flourescens reproduction and respiration patterns. Comparative test series were set up with the various doses in different nutrient cultures to ascertain whether the bacterias' multiplication process or carbohydrate decomposition was more sensitive to the chemicals. (Katz)

EFFECTS OF HEATED EFFLUENT ON HERMATYPIC CORALS AT KAHE POINT, OAHU,
Hawaii Institute of Marine Biology, Honolulu.
P. L. Jokiel, and S. L. Coles.
Pacific Science, Vol 28, No 1, p 1-18, 1974. 10 fig, 4 tab, 23 ref.

Descriptors: *Heated water, *Thermal pollution, *Coral, Benthic fauna, Invertebrates, Marine animals, Reefs, *Hawaii, Power plants, Mortality, Pigments, Discharge(Water), Turbidity, Water pollution sources, Water pollution effects, Benthos, Analytical techniques, Spectrophotometry.
Identifiers: *Hermatypic coral, Pocillopora ssp, Porites ssp.

The effect of thermal enrichment on hermatypic corals was investigated at Kahe Point, Oahu, Hawaii. The reef off the Kahe Power Plant was surveyed before and after an increase in thermal discharge that accompanied plant expansion. Abundances of dead and damaged corals correlated strongly with proximity to plant discharge and with levels of thermal enrichment. Nearly all corals in water 4 degrees to 5 degrees C above ambient were dead. In areas characterized by temperature increases from 2 degrees to 4 degrees C, the corals lost zooxanthellar pigment and suffered high mortality rates. Damage to the corals was most severe in late summer, and conicided with annual ambient temperature maxima. During the winter months the surviving corals slowly regained zooxanthellar pigment, but there was high mortality of corals during the recovery period. (Katz)
W74-11303

THE ACCUMULATION FROM SEA WATER OF 65ZN, 54MN, 58CO AND 59FE BY THE THORNBACK RAY, RAJA CLAVATA L.,
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Fisheries Radiobiological Lab.
R. J. Pentreath.
Journal of Experimental Marine Biology, Vol 12, No 3, p 327-334, 1973. 3 fig, 5 tab, 13 ref.

Descriptors: *Zinc, *Manganese, *Iron, *Cobalt, Absorption, Heavy metals, Radioisotopes, Permeability, Sea water, Teleosts, Bioassay, Path of pollutants, Water pollution effects.
Identifiers: *Raja clavata, *Pleuronectes platessa, *Rays(Thornback), Accumulation, Blood plasma, Organ analysis.

The accumulation of 65Zn and 54Mn from water by the thornback ray, R. clavata L., has been studied at tissue level and their levels of accumulation have been related to stable element concentra-

tions. The accumulation of 58Co and 59Fe has also been studied on a whole body basis and comparisons have been made of the 59Fe levels in the tissues after 84 days with those of the stable element. Lower values of accumulation of the radionuclides were obtained than in the case of the teleost Pleuronectesplatessa. Such differences are discussed in relation to the relative permeabilities of the two species to sea water and the relative ratios of the radionuclides from sea water to blood plasma, and of blood plasma to organ. It is concluded that for both species direct input from water plays only a minor role in the accumulation of the four radionuclides studied. (Katz)
W74-11304

EFFECT OF THERMAL EFFLUENT ON MIGRATING MENHADEN,
National Marine Fisheries Service, Highlands, N.J. Sandy Hook Lab.
J. S. Young, and C. I. Gibson.
Marine Water Pollution Bulletin, Vol 4, No 6, p 94-96, 1973. 12 ref.

Descriptors: *Thermal pollution, Water pollution sources, Water pollution effects, Fishkill, Commercial fishing, Cooling water, Heated water, Waste water(Pollution), Migration, *New York, On-site investigations.
Identifiers: *Long Island Sound, *Menhaden, Scubu observation.

Hot water effluent from power stations kill juvenile menhaden migrating through Long Island Sound. Since the fish sink to the bottom, losses are unrecorded or underestimated. Menhaden in Long Island Sound contribute to the commercial fishery off the eastern seaboard of the United States. At present, the losses are small in comparison to the total number of fish migrating through the Sound. In the future, the increasing use of the Sound and other coastal and estuarine waters may have serious consequences for fisheries. (Katz)

MARINE INTERTIDAL COMMUNITY RESPONSES TO KRAFT PULP MILL EFFLUENT,
British Columbia Univ., Vancouver. Dept. of Zoology.
J. R. E. Harger, and M. D. Nassichuk.
Water, Air, and Soil Pollution, Vol 3, No 1, p 107-122, 1974. 4 fig, 4 tab, 22 ref.

Descriptors: *Pulp wastes, *Intertidal areas, *Canada, Industrial wastes, Water pollution sources, Organic wastes, Sessile algae, Aquatic life, Biological communities, Laboratory tests, Diatoms, Benthos, Analytical techniques, Water pollution effects, Water analysis, Water chemistry, Temperature, Hydrogen ion concentration, Mussels, Dissolved oxygen, Trophic level, Littoral.
Identifiers: Mytilus edulis, British Columbia, Balanus ssp, Barnacles.

An attempt was made to evaluate the effects of effluent from a British Columbia kraft pulp mill on sessile marine community structure. Physical oceanographic data coupled with qualitative and quantitative considerations of the intertidal area were evaluated with respect to the implied effects on community structure and diversity. Experiments involved development of diatom communities on glass slides and the subsequent transfer of such communities to and from polluted zones. Changes in experimental community structure occurring as the result of such manipulation were then compared with control communities. The hypothesis of pulp mill effluent having no effect on community structure was rejected. (Katz)
W74-11306

TOXICITY BIOASSAYS OF CADMIUM ON SELECTED FRESHWATER INVERTEBRATES AND THE INTERACTION OF CADMIUM AND ZINC ON THE FRESHWATER SHRIMP, PARATYA TASMANIENSIS RIEK,
Adelaide Univ. (Australia). Dept. of Zoology.
V. J. Thorp, and P. S. Lake.
Australian Journal of Marine and Freshwater Research, Vol 25, No 1, p 97-104, 1974. 2 fig, 3 tab, 23 ref.

Descriptors: *Zinc, *Cadmium, *Toxicity, *Shrimp, Bioassay, Invertebrates, Freshwater, Aquatic animals, Analytical techniques, Laboratory tests, Heavy metals, Lethal limit, Water pollution effects, *Australia, Mine wastes.
Identifiers: South Esk River(Australia), Paratya tasmaniensis, Austrochiltonia subtenius, Atalophlebia australis, Ischnura heterosticta, Leptoceridae ssp.

In acute toxicity bioassays with cadmium sulphate at 15C in soft water, the concentrations fatal to 50% of the test animals were determined for five freshwater invertebrate species. The 96 hr median lethal concentration (LC50) of cadmium was 0.04 mg/l for the amphipod Austrochiltonia subtenuis, 0.06 mg/l for the shrimp Paratya tasmaniensis, 0.84 mg/l for the ephemeropteran nymph Atalophlebia australis, 250 mg/l for the zygopteran nymph Ischnura heterosticta and well over 2000 mg/l for a trichopteran larva of the Leptoceridae. The bioassays on Paratya indicated that there may be seasonal differences in sensitivity to cadmium. The 96 h LC50 for zinc for Paratya was 1.21 mg/l. Zinc and cadmium appeared to interact less than additively at concentrations below 1 toxic unit. Above this concentration, their interaction was strictly additive. (Katz)
W74-11307

SHORT TERM FATE OF DIETARY DIELDRIN IN THE DIGESTIVE TRACT OF JUVENILE LAKE TROUT (SALVELINUS NAMAYCUSH),
National Marine Fisheries Service, Ann Arbor, Mich. Great Lakes Fishery Lab.
D. J. Stewart, and R. A. Stein.
Bulletin of Environmental Contamination and Toxicology, Vol 11, No 6, p 563-566, 1974. 1 fig, 9 ref.

Descriptors: *Lake trout, *Dieldrin, *Digestion, Chlorinated hydrocarbon pesticides, Organic compounds, Insecticides, Animal physiology, Laboratory tests, Trout, Methodology, Gas chromatography, Bioassay.
Identifiers: *Salvelinus namaycush.

The short term fate of an oral dose of dieldrin in the digestive tract of lake trout was examined by injecting food contaminated with about 1.05 ppm of dieldrin directly into the stomach. Trout were sacrificed at intervals to determine the location of dieldrin in the gut. The decline of dieldrin in the stomach paralleled the decline in the amount of food and little or no dieldrin was found in the intestine. This indicates a rapid uptake or degradation of dieldrin in the pyloric caecal region and demonstrated, under these experimental conditions, that defacation of dieldrin is minimal. (Katz)
W74-11308

RESISTANCE AND RESPIRATORY PHYSIOLOGY OF INTERTIDAL MEIOFAUNA TO OXYGEN-DEFICIENCY,
Bordeaux Univ., Arcachon (France). Inst. of Marine Biology.
P. Lasserre, and J. Renaud-Mornant.
Netherlands Journal of Sea Research, Vol 7, p 290-302, 1973. 3 fig, 1 tab, 33 ref.

Descriptors: *Habitats, *Metabolism, *Oxygen, Lethal limit, Methodology, Oxygen requirements, Hydrogen sulfide, Animal physiology, Adaptation.
Identifiers: *Meiofauna, Hesionides ssp, Stygocapitella ssp, Protodriloides ssp, Stenoxybionic, Euroxybionic.

The resistance and oxygen consumption of six meiofauna groups living in semistable or oceanic sandy beaches were studies in relation to oxygen-deficiency. Under laboratory conditions the 6 groups examined (2 polychaetes, 1 oligochaete, 1 archiannelid, 1 mystacocarid, and 1 harpacticoid copepod) show a high sensitivity to hydrogen sulfide and an intolerance to a low ambient oxygen (below 0.5 ml O2/1). Above this critical limit they are more tolerant and different groups are considered either stenoxybiontic or euroxybiontic. A distinction between metabolic regulators and metabolic conformers is made for some species. Others have complex metabolic rates. The euroxybiontic regulators show highest tolerance to low oxygen tension which enables these species to live at a high level of the sandy beach, an oxygen deficient habitat. Stenoxybionic conformers require a fully oxidized biotope found in the 'high energy beach'. (Katz)
W74-11309

EFFECT OF WATER HARDNESS ON THE TOXICITY OF AN ANIONIC DETERGENT TO FISH,
Unilever Ltd., Sharnbrook (England). Unilever Research Lab.
P. W. A. Tovell, C. Newsome, and D. Howes.
Water Research, Vol 8, No 5, p 291-296, 1974. 5 fig, 8 ref.

Descriptors: *Toxicity, *Detergents, *Anions, *Hardness(Water), Water properties, Absorption, Cations, Trout, Rainbow trout, Isotope studies, Methodology.
Identifiers: *Sodium lauryl sulphate, Goldfish, Salmo gairdneri, Carassius auratus, Tissue uptake, Soft water, Survival times, Sodium ion, Potassium ion, Magnesium ion, Calcium ion.

The toxicity to fish of anionic detergents in solution varies according to the hardness of the water in which the fish are treated. Trout and goldfish are more susceptible to sodium lauryl sulphate (SLS) in hard water than soft, and the rate of absorption of detergent is greater in hard water. It has been shown that the concentration of bivalent cations has a direct effect on the toxicity of SLS. Acclimatization experiments have shown that the toxicity of SLS depends on both the hardness of the water in which the fish was treated and the hardness of the water in which the fish was acclimatized. The mechanism whereby water hardness affects detergent toxicity is discussed. (Katz)
W74-11310

LEAD UPTAKE FROM SEA WATER AND FOOD, AND LEAD LOSS IN THE COMMON MUSSEL MYTILUS EDULIS,
Institut fuer Meeresforschung, Bremerhaven (West Germany).
M. Schulz-Baldes.
Marine Biology, Vol 25, No 3, p 177-193, 1974. 7 fig, 4 tab, 27 ref.

Descriptors: *Mussels, *Lead, *Absorption, Molluscs, Marine animals, Bioassay, Bioindicators, Sea water, Water pollution, Metals, Heavy metals, Food chains, Methodology, Laboratory tests, Spectrophotometry, Analytical techniques, Statistical models.
Identifiers: *Mytilus edulis, *Kidney, Lead loss.

Common mussels were maintained for 6 weeks in sea water containing different concentrations of lead (0.005 to 5 mg/l). The lead concentration in the mussels' whole soft parts was analysed at different times during the experiment. A constant rate of lead uptake, linearly dependent on the lead concentration of the medium, was observed. Rate of lead loss, measured after transferring the mussels into natural sea water, is linearly dependent on the orginal lead concentration in the soft parts. Rates of uptake and loss in large mussels are less than those in small mussels. Adjustment to a steady state is expected to occur in a more ex

ended experimental period. Lead uptake by individual organs of large M. edulis was analysed in test series. Rates of uptake varied in all organs; ne kidney displayed the highest rate. With these hysiological properties M. edulis is an ideal indicator organism for lead pollution in the marine nvironment. (Katz)

THE TOXICITY OF SOME FORMS OF COPPER TO RAINBOW TROUT,
Water Pollution Research Lab., Stevenage (England).
T. L. Shaw, and V. M. Brown.
Water Research, Vol 8, No 6, p 377-382, 1974. 1 fig, 4 tab, 10 ref, append.

Descriptors: *Copper, *Toxicity, *Rainbow trout, Trout, Hardness(Water), Copper compounds, Methodology, Lethal limit, Laboratory tests, Water pollution effects, Hydrogen ion concentration.
Identifiers: *Copper carbonate, Nitrilotriacetic acid, Organo-copper complex, pH effects, Neutralized NTA, Analytical methods, Cupric copper.

The lethal toxicity of copper to rainbow trout in hard water was found to be related to the total concentration at which soluble copper, Cu2+, and CuCO3, was present in the water, rather than to the concentration of either of these two forms alone. It is suggested that, except in the presence of highly toxic organo-copper compounds, from a knowledge of the cupric ion concentration, the pH, and the alkalinity of the water, the total concentration of soluble copper can be calculated and hence the toxicity of that water determined. (Katz)

Swiss Journal of Hydrology (Schweizerische Zeitschrift fur Hydrologie), Vol 34, No 2, p 155-172, 1972. 8 fig, 2 tab, 19 ref.

Descriptors: *Biomass, *Seasonal, Benthos, *Sewage, Chlorophyll, *Primary productivity, Productivity, Biological communities, Ecological distribution, Bacteria, Sphaerotilus, Model studies.
Identifiers: *Heterotrophs, *Phototrophs.

The seasonal changes of the biomass production of benthic microphytes were investigated in outdoor channels for the first 20 days of colonization. The channels were fed with groundwater to which up to 12% settled sewage was added as pollutant. Chlorophyll content of the total biomass allowed estimation of the heterotrophic and phototrophic portions of the total growth. Addition of 12% sewage caused an increase of the heterotrophic biomass at a constant rate for the first 3 to 4 weeks. For each season tested the heterotrophic growth is proportional to the sewage concentration within the range of 0 to 12%. Best phototrophic growth occurs in summer in 1 to 5% sewage. Heterotrophic microphytes find better conditions in winter. (See also W74-11318) (Katz)

E. Eichenberger.
Swiss Journal of Hydrology (Schweizerische Zeitschrift fur Hydrologie), Vol 34, No 2, p 173-189, 1972. 2 fig, 5 tab, 22 ref.

Descriptors: *Benthos, *Sewage, *Biomass, *Self-purification, Primary productivity, Water pollution, Algae, Biological communities, Benthic flora, Artificial watercourses, Model studies.
Identifiers: *Phototrophs, *Heterotrophs, Nitzschia, Test streams.

The benthic growth was investigated during the first 20 days of colonization in 200 m long river models polluted with 0, 1, 5 and 12% settled domestic sewage. The productions of phototrophic and heterotrophic biomass were determined at the beginning, middle and end of the channels. An equation for the distribution of the heterotrophic biomass is described. The phototrophs do not significantly contribute to the removal of growth substrates utilized by the heterotrophs. Different pollution loads in locations containing identical heterotrophic biomass produce markedly different biomass and species composition in phototrophic growth. Concentration change of pollutants in sewage through dilution or biochemical reactions induces different biocenological effects. (See also W74-11317) (Katz)

OXYGEN CONSUMPTION AND ACTIVITY OF THE WHITE SUCKER (CATOSTOMUS COMMERSONI), IN LETHAL AND NONLETHAL LEVELS OF THE ORGANOCHLORINE INSECTICIDE, METHOXYCHLOR,
Queen's Univ., Kingston (Ontario). Dept. of Biology.
K. G. Waiwood, and P. H. Johansen.
Water Research, Vol 8, No 7, p 401-406, 1974. 5 fig, 29 ref.

Descriptors: *Suckers, *Oxygen demand, *Lethal limit, *Insecticides, *Chlorinated hydrocarbon pesticides, Bioassay, Methodology, Respiration, Movement, Continuous flow, Toxicity.
Identifiers: Survival, *Activity, *Methoxychlor, *Sublethal effects, *Catostomus commersoni, Ethanol.

The survival, oxygen consumption and spontaneous activity of suckers were determined at 15 C in water containing different concentrations of methoxychlor in ethanol, ethanol, and no added substances. A dynamic bioassay was used to estimate the 96 h LC50, which was found to be 0.0345 ppm. After 24 h fish exposed to untreated, ethanol-treated and 0.01 ppm methoxychlor-treated water had oxygen uptake rates which were relatively constant and near standard levels. At 0.10 ppm methoxychlor (lethal to all fish within 85 h) oxygen consumption rates were 2-3.5 times as high as those of control fish and activity was greatly increased. The fish lost their balance and the coordination between opercular and locomotor movements. The increase in ventilation that accompanies this hyperactivity may result in increased uptake of insecticide and thereby explain the irreversible nature of the response. (Katz)
W74-11320

THE TOXICITY OF ZINC SULPHATE TO RAINBOW TROUT IN VERY HARD WATER,
Water Pollution Research Lab., Stevenage (England).
J. F. de L. G. Solbe.
Water Research, Vol 8, No 6, p 389-391, 1974. 1 fig, 3 tab, 12 ref.

Descriptors: *Toxicity, *Zinc, *Hardness(Water), *Rainbow trout, Trout, Water quality, Freshwater, Methodology, Analytical technique, Absorption, Hydrogen ion concentration, Lethal limit.
Identifiers: *Zinc sulphate.

Experimentation to determine the toxicity of zinc to rainbow trout in very hard water was performed. The pH of the water directly influences the concentration of dissolved zinc and thus the toxicity. The relation between 48-hour LC50 and the hardness of water that was previously determined for lower values of hardness was also found to apply to an average total hardness of about 500 mg/l as CaCO3. Fish survived longer in harder water and in higher pH water. (Katz)

CHLORINATED INSECTICIDE RESIDUES IN THE EGGS OF SOME FRESHWATER FISH,
Iowa Univ., Iowa City. State Hygienic Lab.
L. G. Johnson, and R. L. Morris.
Bulletin of Environmental Contamination and Toxicity, Vol 11, No 6, p 503-510, 1974. 2 fig, 2 tab, 8 ref.

Descriptors: *Pesticides, *Fish eggs, *Dieldrin, *Freshwater fish, Insecticides, Water pollution sources, Water pollution effects, Bioassay, Bioindicators, Absorption, *Polychlorinated biphenyls, *Chlorinated hydrocarbon pesticide, Separation techniques, Analytical techniques, *DDT, *Aldrin, *Heptachlor, Catfishes, Bass.
Identifiers: *Chlordane, *Flonsil.

Measurements of pesticides in various tissues of fish indicates the extent of the relative pollution of a river. Fish eggs were studied because of the wide variation in pesticide contents in the flesh of different catfish species in Iowa. Dieldrin was the major insecticide residue detected in the eggs and the highest levels were found in eggs from those locations where the highest concentrations were determined in fish flesh and water samples. Eggs of the Walleye had the highest lipid and dieldrin content and catfish had the lowest, with eggs of the largemouth bass between. Little information is available on the effect on reproduction of dieldrin in fish eggs. (Katz)
W74-11323

ACUTE TOXICITY OF UNBLEACHED KRAFT MILL EFFLUENT (UKME) TO THE OPOSSUM SHRIMP, NEOMYSIS AMERICANA SMITH,
Virginia Inst. of Marine Science, Gloucester Point.
F. Jacobs, and G. C. Grant.
Water Research, Vol 8, No 7, p 439-445, 1974. 1 fig, 5 tab, 28 ref.

Descriptors: *Pulp wastes, *Toxicity, *Shrimp, Bioassay, *Biochemical oxygen demand, Methodology, Statistical models, Dissolved oxygen, Water pollution effects.
Identifiers: *Opossum shrimp, *Neomysis americana, Sublethal limit, Detoxification.

The 96 hour TL50 values of unbleached kraft mill effluent (UKME) for N. americana were found to range from 3.29-6.85 per cent at 26-28C and 3.90-7.30 per cent at 16-18C. UKME did not lose its toxicity when stored at 4C for 5-7 days. A concentration of 20 per cent effluent killed 100% of the organisms in 8 of the 12 bioassays. Slope functions and confidence limits of TL50 were calculated. Toxicity did not appear to be correlated with the Biological Oxygen Demand (BOD) of individual batches of raw effluent. (Katz)
W74-11324

ECOLOGICAL IMPLICATIONS OF HEAVY METAL IN FISH FROM THE SEVERN ESTUARY,
Bath Univ. (England).
M. W. Hardisty, R. J. Huggins, S. Kartar, and M. Samsbury.
Marine Pollution Bulletin, Vol 5, No 1, p 12-15, January, 1974. 2 tab, 15 ref.

Descriptors: *Heavy metals, Path of pollutants, Food chains, Lead, Cadmium, Zinc, Shrimp, Teleosts, Bioassay, Snail, Spectrophotometry, Environmental effects, Seasonal, Age, Absorption, Lampreys.
Identifiers: *Flounder, *Platichthyes flesus, Pomatoschistus minutus, Liparis liparis, Lampetra ssp, Gobies.

Tissues and organs of the flounder collected from the Severn at Oldbury, in the course of a year long survey, were analysed for lead, cadmium and zinc. Differences were noted in the level of zinc deposition in the various age groups of this teleost, particularly in autumn and summer. To explain these results, the feeding habits of the flounder were studied and heavy metal analyses were conducted on some of its principal foodstuffs and related animals. (Katz)

C. Amiard-Triquet.
Journal of Experimental Marine Biology and Ecology, Vol 15, No 2, p 159-164, 1974. 1 tab, 11 ref.

Descriptors: *Cesium, *Phaeophyta, *Annelids, *Salinity, Worms, Ions, Absorption, Potassium, Radioisotopes, Bioassay, Adsorption, Equilibrium, Water pollution effects.
Identifiers: *Arenicola marina.

The fixation of 137Cs on fine sand by Arenicola increases when the salinity or K content of water is decreased. The concentration factors for sea water diluted to 60% or with a K level of 50% were twice those for normal sea water, except for the coelomic fluid, the concentration factor of which remained constant. Several assumptions can explain the process: (1) a weaker competition between ions at the lower concentrations; (2) substitution of potassium by cesium; (3) parallel contribution of Cs and K in maintaining a more hypertonic internal environment; and (4) contamination via the food chain in desalinated sea water. (Katz)

HEAVY METAL TOLERANCE OF MARINE PHYTOPLANKTON. I. THE TOLERANCE OF THREE ALGAL SPECIES TO ZINC IN COASTAL SEA WATER,
Norwegian Inst. of Seaweed Research, Trondheim.
A. Jensen, B. Rystad, and S. Melsom.
Journal of Experimental Marine Biology and Ecology, Vol 15, No 2, p 145-157, 1974. 2 fig, 3 tab, 27 ref.

Descriptors: *Zinc, *Algae, *Dialysis, *Toxicity, Diatoms, Aquatic plants, Phytoplankton, Resistance, Laboratory tests, Growth rates, Spectrometry, Methodology, Bioassay, Heavy metals, Bioindicators, Monitoring, Water pollution effects.
Identifiers: *Sublethal effects, *Skeletonema costatum, *Thalassiosira pseudonana, *Phaeodactylum tricornutum.

Tolerance levels to zinc ions of three diatoms grown in dialysis culture in the local fjord water were studied. Declining relative growth rates were observed by addition of 50, 250, and 25,000 micrograms/l of zinc ions, to Skeletonema costatum, Thalassiosira pseudonana, and Phaeodactylum tricornutum, respectively. Reduced final cell concentrations were found at lower zinc levels. A significant increase in zinc uptake at zinc levels that did not seem to influence growth and development took place in at least one species of algae. Two clones of S. costatum showed significant intraspecific differences regarding the tolerance to zinc pollution. Dialysis bioassay was found suit

ole for monitoring heavy metal pollution of aquatic ecipients. (Katz)

EFFECTS OF CRUDE OIL ON THE FEEDING BEHAVIOR OF THE LOBSTER HOMARUS AMERICANUS,
Woods Hole Oceanographic Institution, Mass. Dept. of Chemistry.
A. Atema, and L. S. Stein.
Environmental Pollution, Vol 6, No 2, p 77-86, 1974. 1 fig, 4 tab, 11 ref.

Descriptors: *Oil, *Lobsters, *Behavior, *Feeding rates, Oil spills, Invertebrates, Shellfish, Water pollution effects, Laboratory tests, Methodology, Microscopy, Hydrocarbons, Gas chromatography.
Identifiers: *Sublethal effects, *Feeding behavior, Homarus americanus, La Rosa crude oil.

Small quantities of crude oil (oil-seawater ratio of 1:100,000) interfered with specific, possibly chemosensory behavior of the lobster, Homarus americanus. In their feeding behavior the period between noticing food and going after it doubled following the addition of oil. In contrast, the water-soluble fraction of this same amount of crude oil had no noticeable effects on chemosensory and feeding behavior. No morphological changes in odor receptors after oil exposure were detected by light and electron microscopy. Chemical analyses showed that the original lipid concentration of water drops when brought in contact with an oil slick. Over a five-day period the oil degraded in seawater. Results suggest that small quantities of whole oil mixed into seawater constitute a noxious smell to the lobster, depressing appetite and chemical excitability and increasing the time taken to find food. (Katz)

THE UTILIZATION OF A SIMPLE EXPERIMENTAL DEVICE FOR STUDY OF WATER POLLUTION IN SITU: COMPARATIVE EFFECTS OF THREE ANTI-PETROLEUM EMULSIFYING AGENTS,
Museum National d'Histoire Naturelle, Paris (France). Laboratoire de Physiologie Generale et Comparee.
J. C. Lacaze.
Tethys. Vol 3, No 4, p 705-715, 1971. Illus. English summary.

Descriptors: *Analytical techniques, Photosynthesis, Chlorophyll, Emulsions.
Identifiers: Corexit, Gamosol, Sefoil.

By establishing in situ experimental ecosystems, pollution research under actual conditions was conducted. The experiment was carried out in an oyster culture basin of a lagoon in the region of Sables d'Olonne (France) by using devices to section off the water into a number of similar natural environmental compartments to be used for pollutant treatments and controls. Each device which isolated 560 liters of water consisted of a polyethylene sheath equipped with 60 cm diameter polyvinyl chloride rings. Floats were attached to the upper rings while the lower ones were weighted and became buried in the sand. Except for the controls, each of these experimental ecosystems received a pollutant at the rate of 40mg/l in the form of an anti-petroleum product. The criteria used to illustrate the effects of pollution were: photosynthetic activity; concentration of chlorophyll a; dry weight of the plankton. The product Corexit produced only weak and temporary changes. Sefoil acted as a fertilizer, provoking a rapid increase in photosynthesis and chlorophyll a concentration; this was followed by considerable growth in the zooplankton, particularly of the copepods which caused the disappearance of the phytoplankton by the end of the experiment. The surface-active fraction of the third product used, Gamosol, caused an almost complete inhibition of photosynthesis during the whole of the 15 day experimental period.--Copyright 1974, Biological Abstracts, Inc.

POLYCHLORINATED BIPHENYLS AND P,P' DDE IN GREEN TURTLE EGGS FROM ASCENSION ISLAND, SOUTH ATLANTIC OCEAN,
Florida Univ., Gainesville. Dept. of Food Science.; and Florida Univ., Gainesville. Dept. of Zoology.
N. P. Thompson, P. W. Rankin, and D. W. Johnston.
Bulletin of Environmental Contamination and Toxicology, Vol 11, No 5, p 399-406, 1974. 3 fig, 1 tab, 15 ref.

Descriptors: *Polychlorinated biphenyls, *DDT, *Turtles, Arochlor, DDD, DDE, Gas chromatography, Separation techniques, Marine animals, Methodology, Path of pollutants, Atlantic Ocean.
Identifiers: *Ascension Island(South Atlantic Ocean), *Chelonia mydas, *Eggs.

Industrial pollutants have become widely distributed in global ecosystems, as have persistent pesticides. Ascension Island, one of the most isolated islands in the South Atlantic Ocean, is utilized by sea birds and turtles (especially the marine pelagic Green Turtle, Chelonia mydas) for breeding. Bird and turtle eggs were sampled for PCB and pesticide analyses. These turtles provide protein for human populations throughout the range of species involved. Gas chromatography of the contents of turtle eggs evidenced PCB's as well as p,p'DDE, DDD, and DDT. Several arochlor compounds were found also. It is apparent that these pesticides were obtained from organisms eaten en route to Ascension Island, in the relatively unpolluted waters of the western South Atlantic Ocean. No concrete information on possible effects on the organism is available. (Katz)

TRACE METALS IN LAKE CAYUGA LAKE TROUT (SALVELINUS NAMAYCUSH) IN RELATION TO AGE,
Corning Glass Works, N.Y. Research and Development Lab.
S. S. C. Tong, W. D. Youngs, W. H. Gutenmann, and D. J. Lisk.
Journal Fisheries Research Board of Canada, Vol 31, No 2, p 238-239, 1974. 1 tab, 5 ref.

Descriptors: *Trace elements, *Chromium, *Lake trout, *Age, Molybdenum, Tin, Trout, Bioassay, Mercury, Analytic technique, Mass spectrometry, Absorption, *New York.
Identifiers: *Fish age, Rhodium, Methyl mercury, *Lake Cayuga(NY), Accumulation, Aluminum, Antimony, Arsenic, Barium, Boron, Cadmium, Cesium, Cobalt, Copper, Gallium, Germanium, Indium, Iron, Lead, Manganese, Nickel, Niobium, Palladium, Praseodymium, Rubidium, Ruthenium, Silicon, Silver, Strontium, Tellurium, Terbium, Thulmium, Titanium, Tungsten, Vanadium, Yttrium, Zinc, Zirconium.

Concentrations of trace metals in lake trout were investigated in relationship to fish age. Chromium concentration increased and molybdenum and tin concentrations decreased in Lake Cayuga lake trout from age 1 to 12 years. The concentration of rhodium ranged from about 100 to 200 ppb. The concentrations of 33 other trace metals in the fish are reported. The concentrations of most metals in lake trout are apparently not related to the age of the fish. (Katz)
W74-11336

ADAPTATION OF THE POLYCHAETE NEREIS DIVERSICOLOR TO ESTUARINE SEDIMENTS CONTAINING HIGH CONCENTRATIONS OF ZINC AND CADMIUM,
Marine Biological Association of the United Kingdom, Plymouth (England). Plymouth Lab.
G. W. Bryan, and L. G. Hummerstone.
Journal of the Marine Biological Association of the United Kingdom, Vol 53, No 4, p 839-857, November 1973. 11 fig, 6 tab, 18 ref.

Descriptors: *Zinc, *Cadmium, *Adaptation, Sediments, *Estuaries, Absorption, *Bioassay, Worms, Environmental effects, Water pollution sources, Toxicity, Analytical technique, Methodology, Isotope studies, Adsorption, Resistance, Salinity.
Identifiers: *Nereis diversicolor, *Polychaetes, *United Kingdom(England).

Concentrations of zinc and cadmium in N. diversicolor have been compared with those of sediments in the estuaries of 26 rivers. The concentrations of zinc in sediments varied by a factor of 30, from 100 to 3000 micrograms/g while the concentrations in worms varied by a factor of only 2.7 from 130 to 350 micrograms/g dry weight. Concentrations of cadmium in the sediments varied by a factor of 46 from about 0.2 to 9.3 micrograms/g and concentrations in the worms were roughly proportional to them and varied by a factor of 45 from 0.08 to 3.6 micrograms/g. These results suggest that zinc is regulated by the worm whereas cadmium is not. Some factors which influence the absorption of heavy metals are discussed and the adaptation of Nereis to high concentrations of metals is compared with that of other organisms. (See also W74-11338) (Katz)
W74-11337

ADAPTATION OF THE POLYCHAETE NEREIS DIVERSICOLOR TO MANGANESE IN ESTUARINE SEDIMENTS,
Marine Biological Association of the United Kingdom, Plymouth (England). Plymouth Lab.
G. W. Bryan, and L. G. Hummerstone.
Journal of the Marine Biological Association of the United Kingdom, Vol 53, No 4, p 859-872, November 1973. 5 fig, 4 tab, 13 ref.

Descriptors: *Manganese, Absorption, Metals, Sediments, Isotope studies, Analytical techniques, Salinity, *Estuaries, *Bioassay, Worms, Seasonal.
Identifiers: *Nereis diversicolor, *Polychaetes, Interstitial water, Isotopic exchange, United Kingdom(SW England).

Concentrations of manganese have been measured in Nereis diversicolor, interstitial water and sediments from estuaries draining the mineralized areas of South-West England. Results from the field observations were supported by experiments using 54Mn. Manganese appears to occur in Nereis in two pools, one exchanging slowly and the other more rapidly. The slowly exchanging pool amounts to roughly 10 micrograms/g on a dry-weight basis and upon this is superimposed the more rapidly exchanging pool, the magnitude of which depends on several factors. The two most important of these are the concentration of manganese in the interstitial water and salinity. With decreasing salinity the concentration factor for manganese increases, and therefore the highest concentrations of manganese are usually found in animals from the least saline areas of an estuary. (See also W74-11337) (Katz)

THE GROWTH KINETICS OF ISOCHRYSIS GALBANA IN CULTURES CONTAINING SUBLETHAL CONCENTRATIONS OF MERCURIC CHLORIDE,
Marine Biological Association of the United Kingdom, Plymouth (England).
A. B. Davies.
Journal of the Marine Biological Association of the United Kingdom, Vol 54, No 1, p 157-169, February 1974. 8 fig, 2 tab, 23 ref.

Descriptors: *Mercury, *Phytoplankton, *Kinetics, *Growth rates, Heavy metals, Absorption, Adsorption, Methodology, Toxicity, Lethal limit, Separation techniques, Cytological studies, Biochemistry.
Identifiers: *Mercuric chloride, *Isochrysis galbana.

Measurements of the effect of mercuric chloride upon the growth of Isochrysis galbana in culture are reported. The mercury was concentrated by the plant cells to a very high level. It is shown that the specific growth rate of the cells in the presence of mercury was reduced linearly by increasing intracellular levels of the metal. The intracellular concentration which just prevented growth (about 2g/l) was not instantly lethal and chemical removal of the mercury allowed growth to start again and achieve population levels approaching those of the control. The presence of mercury in the cells caused almost a doubling in cell size at the highest sublethal concentrations. This was probably due to combination with sulphur-containing compounds that are important in the process of cell division. (Katz)

STUDIES ON THE MECHANISMS OF RED TIDE OCCURRENCE IN HAKATA BAY, 3. THE CHARACTERISTICS OF EFFECTIVE BOTTOM MUD AND ITS GEOGRAPHICAL DISTRIBUTION PATTERN, (IN JAPANESE),
Kyushu Univ., Fukuoka (Japan). Faculty of Agriculture.
T. Honjo, and T. Hanaoka.
Bulletin of the Plankton Society of Japan, Vol 20, No 2, p 126-130, 1974. 4 fig, 4 ref.

Descriptors: *Red tide, *Bottom sediments, Marine algae, Water pollution sources, Water pollution, Laboratory tests, Growth rate, Pigments, Mud.
Identifiers: *Heterosigma sp, *Japan(Hakata Bay), Mud suspensions.

A red tide flagellate, Heterosigma sp., was cultured by addition of bottom mud (mud suspension) collected from Hakata Bay at six different times. The growth rate for each mud sample was calculated. Using these values, the correlation between the distribution of the water area where red tide frequently occurred and that of the bottom mud which caused an acceleration effect are discussed. The characteristics of bottom mud having an accelerating effect on the growth of Heterosigma sp. are also discussed. (Katz)

THE FLAGELLATA EXAMINED FROM POLLUTED WATER OF THE INLAND SEA, SETONAIKAI,
Hiroshima Univ. (Japan).
Y. Hada.
Bulletin of the Plankton Society of Japan, Vol 20, No 2, p 112-125, 1974. 3 fig, 4 tab, 24 ref.

Descriptors: *Eutrophication, Industrial wastes, Water pollution sources, Water pollution effects, Fishkill, Domestic wastes, Sewage, Dinoflagellates, Oysters.
Identifiers: *Blooming flagellates, *Japan(Inland Sea), Yellowtails, Rhodomonas ssp, Heterosigma ssp, Hemieutreptia ssp, Colorless flagellates.

Pollution of the Inland Sea, Hiroshima Bay and the adjacent region by industrial drainage, city sewage and human wastes, has caused a change in the species and number of blooming flagellates. Rhodomonas lacustris, Heterosigma inlandica and Hemieutreptia antiqua frequently bloom and cause great damage to cultured yellowtails in the Inland Sea. The colored flagellates, closely related to colored water have annually increased in number of species. Species blooming in polluted waters are noted. Several new species of algae are described. (Katz)
W74-11342

TOXICITY STUDY OF TWO OIL SPILL REAGENTS TOWARD HUDSON RIVER FISH SPECIES,
Marist Coll., Poughkeepsie, N.Y. Environmental Science Program.
R. Rehwoldt, L. Lasko, C. Shaw, and E. Wirhowski.
Bulletin of Environmental Contamination and Toxicology, Vol 11, No 2, p 159-162, 1974. 3 tab, 8 ref.

Descriptors: *Dispersion, *Oil, *Toxicity, Fish, Lethal limit, Bass, Carp, Eels, Perches, Killifishes, *New York, *Hudson River.
Identifiers: *Linear alkylate sulfonate, *Herder, *Dispersants, Collecting agents, Sublethal limit, Pumpkinseed, Fuel oil.

The median toxicity of No. 2 and No. 4 oils was determined in laboratory tests, as well as the effects of dispersants and collecting agents on this toxicity. Linear alkylate sulfonate (LAS) was the dispersant used and the collecting agent was Herder. Results showed that the dispersant is far more toxic for all species of fish tested than the oil, that the toxicity of oils increased in tanks containing sublethal amounts of LAS, and that Herder was both nontoxic and has little effect on the toxicity of oil to the species tested. (Katz)
W74-11344

GROWTH STIMULATION OF AXENIC RED ALGAE BY SIMPLE PHENOLIC COMPOUNDS,
Uppsala Univ. (Sweden). Inst. of Physiological Botany.
L. Fries.
Journal of Experimental Marine Biology and Ecology, Vol 15, p 1-9, 1974. 5 tab, 27 ref.

Descriptors: *Phenols, *Rhodophyta, Aromatic compounds, Organic compounds, Growth rate, Plant morphology, Biochemistry, Water pollution effects, Methodology, Toxicity, Chemical properties, Plant growth substances, Plant physiology.
Identifiers: *Goniotrichum alsidii, *Polysiphonia urcedata, *Growth stimulation vanillin, p-hydroxybenzaldehyde, Syringaldehyde, Veratraldehyde.

Since coumarin, caffeic acid, and ferulic acid are found to stimulate growth and/or morphology of the red alga Goniotrichum alsidii (Zanard.) Howe, representatives for other groups of phenolic compounds have been investigated in concentrations of 4 . 10-5 to 4 . 10-7 M. The strongest stimulation of growth was obtained with p-hydroxybenzaldehyde, vanillin, syringaldehyde, and veratraldehyde, while corresponding acids gave lower response. 3,4-dihydroxy benzoic acid, 3-methylcatechol, 4-methylcatechol and p-hydroxyphenyl pyruvic acid also enhanced growth. Polysiphonia urceolata (Dillw.) Grev. showed a very small or no response to the same compounds. The role of these active phenols is discussed. The high activity of p-hydroxyphenyl pyruvic acid could point to a plastoquinone, but no further conclusions can be drawn as long as the role of the bromophenols is unknown. (Katz)

SUBLETHAL EFFECTS OF SEVERAL METALLIC SALTS-ORGANIC COMPOUNDS COMBINATIONS UPON THE HETEROTROPHIC MICROFLORA OF A NATURAL WATER,
Simon Fraser Univ., Burnaby (British Columbia). Dept. of Biological Sciences.
L. J. Albright, and E. M. Wilson.
Water Research, Vol 8, p 101-105, 1974. 3 fig, 3 tab, 10 ref.

Descriptors: *Organic compounds, *Microorganisms, *Heavy metals, Salts, Cations, Laboratory tests, Bacteria, Copper, Mercury, Zinc, Ponds, Plant growth, Lethal limit, Water pollution effects.
Identifiers: *Sublethal effects.

e effects of several sublethal combinations of
metallic salts Ag2SO4, CuC12, HgC12, ZnC12
h the organic compounds L-cysteine and albu-
n upon the heterotrophic activity of the
croflora of a natural water are studied. This
terotrophic activity technique is based upon the
take and mineralization of a radioactivity
elled metabolite by the indigenous microflora
the Simon Fraser University reflecting pool
ter. Data analysis by Michaelis-Menten enzyme
etics equations allows the estimation of the
ximum rate of heterotrophic activity as well as
determination of the turnover time of the
rient in question. The addition of a sublethal
mbination of Cu(2+) and Zn(2+) to a sample of
poolwater decreases heterotrophic activity to
proximately the same extent as the additive
crease caused by these two cations added
parately to samples of this water. Cu(2+) and
(2+) treated water samples do not recover the
metallic salt treatment activity following a
ee-day incubation. Both L-cysteine and albu-
n have no protective effect upon heterotrophic
ivity inhibition caused by Hg(2+) and Ag(+)
pectively, at the concentrations used.

aerobic studies a mixed culture (simulating ac-
ated sludge) was used for evaluating the toxicity
500 mg/l chromates. A sludge having a
dominance of sphaerotilus or one having a
dominance gave rather different responses to
same concentration of chromate. When a
dge was dosed with chromate at each feeding to
aluate the degree of acclimatization, the sludge
ame very bulky from filamentous growths.
cause of the different sludge responses, dif-
ent toxicities, and the different response of
lds and bacteria at 500 mg/l chromate in agar,
re cultures were used to evaluate the effect of
romate on respiration and to count the organ-
isms surviving the respiration study period at various concentrations of chromate. It is concluded that the degree of depression of respiration of an activated sludge by chromate during sewage treatment will depend on the amount of reproduction which would have occurred in the sludge within a short period of time. Chromates have an effect on the genetic expression of microorganisms, and chromic ions show a toxic effect on them, but the data do not indicate where the attack occurs. (Jernigan-Vanderbilt)

INTERRELATIONSHIP OF BIOCHEMICAL RESPONSES TO THE ABSORPTION OF INORGANIC LEAD,
Amsterdam Univ. (Netherlands). Coronel Lab. for Occupational Medicine and Environmental Health.
R. L. Zielhuis.
Archives of Environmental Health, Vol 23 No 4, p 299-312, October, 1971. 6 fig, 3 tab, 96 ref.

Descriptors: *Lead, *Toxicity, *Human pathology, Testing procedures, Inorganic compounds, Biochemistry, Measurement, *Absorption.
Identifiers: Subclinical effects.

Increases in the rate of the absorption of lead by human beings, beyond that which occurs in consequence of the inevitable exposure in the common environment, result in biological responses, represented by certain biochemical phenomena, without, necessarily, the development of any symptoms of lead poisoning. Articles in the scientific and professional literature dealing with the subject are examined. The relationships which exist between these biochemical responses to the absorption of lead are examined in order to demonstrate the extent to which each response can be employed as a prediction of the degree of lead absorption, as well as the status of the other phenomena. In this manner, the relative usefulness of these responses as indicators of the occupational hazard of lead absorption by exposed individuals and groups can be examined. Pb in the blood is recommended as a valid measure of exposure if methods of analysis are appropriate and when used in conjunction with another value such as Pb, ALA or coproporphyrin in the urine. SCIENTISTS FIND HOW MERCURY DAMAGES CELLS,
HSMHA Health Reports, Vol 86, No 9, p 790, September, 1971.

Descriptors: *Animal pathology, *Mercury, *Cytological studies, *Rodents, Biochemistry, Animal physiology, Pollutants, Environmental effects, Toxins, Laboratory tests, Laboratory animals, Measurements, Evaluation.

Correlations between mercury and cell damage have been investigated by a team of University of Wisconsin scientists. Rats were fed doses of mercury simulating human intake and several kinds of cells were analyzed. Findings showed that mercury binds to the cell membrane structure and reduces the cell's amount of RNA. Although some cells are less adversely affected than others, no cells are immune to mercury poisoning. Nerve cells of the dorsal root ganglia located outside the spinal cord, which serve as the common pathway for sensory impulses coming into the central nervous system, suffered a 30% reduction in cell size, a 30% loss in the number of cells and more than 50% loss of RNA. Motor nerve cells in the spinal cord were only slightly affected by mercury. In these cells, mercury which got into the cells became concentrated in axons leaving the cell body unharmed, suggesting a compensatory effort by the cell to restore proper functioning. EARLY ACTIONS OF CADMIUM IN THE RAT AND DOMESTIC FOWL-6 TESTICULAR AND MUSCLE BLOOD FLOW CHANGES,
Georgia Univ., Athens. Dept. of Animal Science.
A. D. Johnson, and P. C. Turner.
Comparative Biochemistry and Physiology, Vol 41A, No 3, p 451-456, 1972. 2 fig, 15 ref.

Descriptors: *Cadmium, *Zinc, *Rodents, *Birds, *Metabolism, Biochemistry, Animal physiology, Toxins, Environmental effects, Metals, Laboratory tests, Measurements.
Identifiers: Blood Flow Rates.

The action of cadmium on very early changes in relative blood flow (RBF) of the testis and muscle in the fowl and rat during the 120 min. period immediately following cadmium injection was examined. Male rats and domestic fowl were injected subcutaneously with 0.03m-moles of cadmium chloride/kg body weight with some of the rats previously treated with zinc acetate. In the fowl no blood flow changes were detected due to Cd. In the rat Cd resulted in a sharp increase in blood flow to the testis at 2.5 and 10 min. after Cd was administered, followed by a return to normal rates. Zinc acetate pretreatment resulted in blood flow which was higher than in the untreated rats. When this pre-treatment was followed by cadmium the sharp differences of blood flow rates of rats pretreated with zinc and rats which were not pretreated were not manifest. Cadmium acts on the vasculature of the testis of the rat but not that of the domestic fowl and zinc pre-treatment in the rat moderates the action of cadmium on the vasculature. (Jerome-Vanderbilt)

EFFECTS OF REGULATORY GUIDELINES OF THE INTAKE OF MERCURY FROM FISH - THE MECCA PROJECT,
National Marine Fisheries Service, Washington, D.C. Fishery Products Research and Inspection Div.
R. Finch.
Fishery Bulletin, Vol 71, No 3, p 615-626, 1973. 6 tab, 7 ref, append.

Descriptors: *Mercury, *Toxicity, *Human physiology, *Fish, Marine animals, *Public health, Diets, United States, Regulation.

The MECCA program applies a survey of the fish consumption habits of a sample of over 4500 individuals, representative of the U.S. population, to build a computer model, which uses known levels of microconstituents in 52 kinds of fish to predict the distribution of the daily intakes of the microconstituents from fish among the survey participants. The model was applied to mercury levels in fish to estimate the effects of guidelines (maximum permitted levels) for fish in protecting the population against excessive intake. The study indicated that, for the sample population, intakes of mercury from fish would remain safe if the guideline for mercury in fish were raised from the present level of 0.5 to 1.5ppm. The effect of such an increase would be of benefit to both the consumer and the fishing industry. This model can be used to predict the distribution of consumer in-

takes from fish of any constituent present in the fish, whether nutritious or potentially hazardous, for which the levels in the edible portion of the 52 kinds of fish used in the model are known. (Jernigan-Vanderbilt)

THE INTERACTION OF MERCURY WITH CADMIUM AND ZINC IN MAMMALIAN EMBRYONIC DEVELOPMENT,
Dartmouth Medical School, Hanover, N. H. Dept. of Anatomy.
T. F. Gale.
Environmental Research, Vol 6, No 1, p 95-105, 1973. 3 fig, 2 tab, 26 ref.

Descriptors: *Mercury, *Cadmium, *Zinc, *Animal pathology, *Embryonic growth stage, Pollutants, Environmental effects, Growth stages, Metabolism, Deformation, Toxicity.

Mercuric acetate together with either cadmium sulfate or zinc sulfate was administered intravenously to pregnant golden hamsters on the eighth gestation day in order to study their effects on embryogenesis. Upon sacrifice on either day 12 or 14 of gestation, the resorption and malformation rates were determined and all living embryos were examined for gross malformations. The detrimental effects of the mercury and cadmium combinations were more severe than those of the mercury and zinc combinations. With both combinations the severity of the embryotoxicity depends upon the method by which the metals are introduced and to some extent upon the dosage level of the Hg. The protective value of the zinc against the embryopathic effects of Hg is also determined by the method of administration of the two metals. Both types of malformations observed after the administration of either Cd or Hg alone were observed in animals treated with a combination of the two. The results are briefly correlated with known biological actions of Cd, Hg, and Zn. (Jerome-Vanderbilt)

CHARACTERISTICS AND RELATIONSHIPS OF MERCURY-RESISTANT MUTANTS AND METHIONINE AUXOTROPHS OF YEAST,
Rochester Univ. School of Medicine, N.Y. Dept. of Radiation Biology and Biophysics.
A. Singh, and F. Sherman.
Journal of Bacteriology, Vol 118, No 3, p 911-918, June, 1974 2 fig, 5 tab, 26 ref. NSF(GI300978)-PHS(GM12702).

Descriptors: *Mercury, *Metabolism, *Bacteria, Laboratory tests, Organic compounds, Testing procedures, Bacteriology, Microbiology, *Yeasts.
Identifiers: *Methionine antotrophs.

Approximately one-half of the mutants of Saccharomyces cerevisiae that are selected as resistant to methyl mercury are also found to require methionine. Eighty four percent of these met mutations occur at the met15 locus, and the remaining 16% occur at the met2 locus. Surprisingly, the methionine-requiring mutants are recovered at a much higher frequency on methionineless media than on media supplemented with methionine. Growth patterns of the met mutants on media having a continuous concentration gradient of methionine and mercury compounds indicate that, at a critical concentration of the mercury compounds, the methionine requirement of certain met mutants is partially or completely alleviated. This was found for met2, met15, and to a lesser extent for met6, but not for any other methionine mutants. This loss of methionine requirement is produced with methyl mercury, phenyl mercury, and mercuric chloride although met2 and met15 strains can be shown to be resistant only to methyl mercury. Other methionine auxotrophs are not resistant to any of the three mercury compounds. It is suggested that met2 and met15 mutants produce a simple diffusible substance, which detoxifies methyl mercury, which reacts with mercuric chloride to produce a sheen, and which is the cause of the methionine requirement. THE SEASONAL CYCLE OF COPPER CONCENTRATION IN BUSYCON CANALICULATUM L,
University of South Florida, St. Petersburg. Dept. of Marine Science.
S. B. Betzer, and M. E. Q. Pilson.
Biological Bulletin, Vol 146, p 165-175, April, 1974. 4 fig, 1 tab, 16 ref.

Descriptors: *Copper, *Gastropods, *Seasonal, *Sea water, Aquatic life, Mollusks, Testing procedures, Analytical techniques, Spectroscopy, Spatial distribution, Temporal distribution, Path of pollutants, Water pollution effects.
Identifiers: *Busycon canaliculatum.

Copper is present in seawater in only trace amounts (3 microgram/1). The copper concentration in marine gastropods, however, has been shown to be generally high, up to 100 microgram/g. This implies the presence of a mechanism for storing copper taken up either from the diet or directly from seawater. In this study, specimens of the locally abundant channeled whelk, Busycon canaliculatum L., were examined for copper concentration in various organs and tissues at different seasons of the year. Individual tissues of approximately 100 whelks were analyzed for copper content. Tissue copper concentrations showed a high degree of individual variation, but seasonal trends were evident. In the digestive gland, the organ with the highest copper concentration, the mean monthly concentrations were about 5 to 10 times higher in the summer (400-900 MICROGRAM Cu/g fresh weight) than in the winter (65-120 microgram Cu/g). Gut concentrations followed the same seasonal trend. Monthly average blood copper and protein ranged seasonally from an average of 42 microgram/ml in February to 175 microgram/ml in June. Whelks in Narragansett Bay usually begin to feed in late May or early June: the general early summer increases in the copper concentration of most tissues correlated with this commencement of feeding. (Jernigan-Vanderbilt)
W74-11384

TRACE ELEMENTS: A GROWING APPRECIATION OF THEIR EFFECTS ON MAN,
T. H. Maugh, II.
Science, Vol 181, p 253-254, July 20, 1973.

Descriptors: *Trace elements, *Human pathology, *Toxicity, *Nutrients, Inorganic compounds, Organic compounds, Lead, Mercury, Beryllium, Nickel, Public health, Food, *Water pollution effects, Air pollution effects.

The effects of the different trace elements on man are discussed. New research is continually expanding the number of metabolic systems known to be affected by trace elements and is revealing many relationships between trace element concentrations and abnormal states of health. The evaluation of trace element concentrations may soon play a fundamental role in the diagnosis of illness and even in prevention. Many trace elements are beneficial. Fourteen different trace elements have been identified as essential to human health. Cobalt, zinc, and manganese, for example, serve as cofactors for various metabolic enzymes, and iron is an integral component of hemoglobin. On the other hand, lead and methylmercury have been shown to damage the central nervous system. Cadmium decalcifies bones; beryllium is highly carcinogenic; nickel carbonyls have been implicated in lung cancer, etc. There is a great deal yet to be learned about the effects of trace elements on human physiology and a great many benefits to be obtained from this knowledge. However, it will be of little use if the practicing physicians do not start applying this new found knowledge. (Jernigan-Vanderbilt)

5D. Waste Treatment Processes

AGRICULTURAL WASTE WATER ACCOMMODATION AND UTILIZATION BY VARIOUS FORAGES,
Maryland Univ., College Park. Dept. of Agronomy.
V. Larsen, J. H. Axley, and G. L. Miller.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-234 631, $4.50 in paper copy, $2.25 in microfiche. Maryland Water Resources Research Center, College Park, Technical Report No 19, (1974). 92 p, 12 fig, 28 tab, 81 ref. OWRR A-006-MD(1). 14-01-0001-790.

Descriptors: *Farm wastes, *Sewage treatment, *Forages, *Crop production, *Denitrification, *Nutrient removal, Water reuse, *Nitrogen, *Poultry, Soil water, Groundwater, *Phosphorus, Loam, Sands, *Waste water treatment.
Identifiers: Sassafras sandy loam.

The influence of poultry processing plant sewage upon forages, soil, and the ground water was studied. Harvesting the forages resulted in removal of about 200 to 300 kg N/ha/year from the system. Ammonia volatilization from plant leaves and soil after sprinkler irrigation of the sewage was 35 to 110 kg N/ha/year. It never exceeded 10% of the applied nitrogen. Denitrification within the soil accounted for 20 to 70% of the applied nitrogen. Denitrification was more important in removal of nitrogen than harvesting of the crop, when more than 970 kg N/ha/year was applied annually as sewage. Soil water dilution of the effluent acted as nitrogen sink. It was important at lower sewage application rates, but negligible at the higher rates of 274 to 408 cm/year of sewage. Two and a half ppm NO3-N was found in the ground water at a depth of 6 m when 547 kg N/ha/year was applied. If the nitrogen application was increased to 3219 kg N/ha/year 11.2 ppm NO3-N was found in the ground water at a depth of 9 m. This is slightly above the safe limit of 10 ppm NO3-N assigned by the U. S. Public Health Service. Ninety-five to 99% of the applied phosphorus was removed from the sewage by the first 30 cm of the soil. A maximum phosphate adsorption study showed that it would take a minimum of 15 years for 3 m of this Sassafras sandy loam soil to become saturated with phosphorus if the phosphorus application rates in the sewage (508 cm/year) remained the same.

THE USE OF MAGNETIC IRON OXIDE FOR RECOVERY OF VIRUS FROM WATER,
New Hampshire Univ., Durham. Water Resource Research Center.
F. Pearson, and T. G. Metcalf.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-234 626 $3.25 in paper copy, $2.25 in microfiche. Research Report No 10, (1974). 38 p, 4 fig, 9 tab, 16 ref OWRR A-014-NH(1). 14-31-0001-3029.

Descriptors: *Iron oxides, *Viruses, *Microorganisms, Inorganic compounds, *Adsorption, Hydrogen ion concentration, *Waste water treatment, *Pollutant identification.
Identifiers: *Magnetic iron oxide, Aquatic virology, *Poliovirus, *Enterovirus, Elution, Virus recovery, Membrane filters.

Magnetic iron oxide was found to consist of a mixture of the gamma spinel of Fe2O3 and alpha spinel of Fe3O4. Electron micrographs showed a long, irregular, rod-like structure. Virus interaction with magnetic iron oxide was believed to occur at multiple combining points present at each

tahedral site of an Fe atom. The interaction was onsidered to be an adsorptive process. The egree of adsorption was dependent upon the elec-ostatic potential in effect between iron oxide and rus coat protein surfaces. The potential eveloped was a function of structural protein nization, and its extent the result of solution pH lative to protein isoelectric point. Virus interac-on with magnetic iron oxide was independent of on oxide arrangement in columns or this sand-ich-like layers. Virus recovery was most effec-ve when elutions from thin layers were made. dsorption was favored by acid pH while elution as best at alkaline pH. Virus recoveries of 90 per-nt were made from litre samples of distilled ater. Experimental findings led to a prediction of limited role for use of magnetic iron oxide for covery of virus from surface waters.

FFICIENCY TESTS FOR MICROSTRAINER ASTE TREATMENT, (MAIKURO SUTORENA YORU SHORISUI KOJO SHIKEN),
agoya Municipal Government Dept. of Sewage orks (Japan).
Iwata, Y. Ito, and O. Kamata.
izu Shori Gijutsu, Vol 14, No 10, p 45-50, Oc-ber, 1973. 14 ref.

escriptors: *Sewage treatment, Water treatment, eatment methods, Municipal wastes, iochemical oxygen demand, *Suspended solids, Vaste water treatment.
entifiers: *Microstrainer.

e efficiency of 510-mesh microstrainer was aluated using the secondary treatment water of ewage treatment plant, and a mixture of prima-settling pond sewage screened by 60-mesh net d the secondary treatment water. The drum tation speed, cleansing water pressure, and spended solids (SS) concentration were varied observe the turbidity, SS, BOD, COD, and liforms, by sampling water every two hours for hours. The most important point in the function a microstrainer is the setting of filter loss head, hich has a close relationship with the SS and OD elimination rates. When a film is formed on e mesh, smaller SS can be eliminated and the mination rate of a given mesh improves. There-re, to get a maximum elimination efficiency, the s water head must be set for quick film forma-n; yet, if the loss water head is too great, the m will be destroyed and the elimination rate will crease. If SS concentration of the treatment water is constant, the relationship among loss water head and the drum rotation speed, and cleansing water pressure can be calculated. If the filter speed and cleansing water pressure are constant, the slower the rotation speed, the greater will be the loss water head. When SS was 7 ppm, the filter index was 7/m with the secondary treatment water; with the ximed sewage water of 15 ppm SS, FI was 5.2/m. Loss water head and SS-BOD elimination rates have close relationships, but the elimination conditions are quite different. With the secondary treatment water, when loss head was 19/mm, SS elimination rate was 42.3 percent, but BOD elimination with H (loss head) 12 mm was 31.2 percent. And when H increased, BOD elimination decreased. In the mixed sewage, with the loss head increase, BOD elimination rate decreased, but SS elimination rate increased gradually. The maximum COD elimination rate in any case was 10 percent; the microstrainer seemed ineffective for COD. (Seigle-FIRL)
W74-10915

EXPERIMENTAL HYDROPONIC GARDENING WITH MUNICIPAL WASTE WATER,
Florida Inst. of Tech., Melbourne. Dept. of Oceanography.
D. R. Sias, and T. A. Nevin.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 5, p 272-278 1973. 3 fig, 1 tab, 9 ref.

Descriptors: *Hydroponics, *Aquiculture, Municipal wastes, *Waste disposal, Municipal water, Irradiation, Chlorination, Agriculture, Tomatoes, *Recycling, *Waste water treatment, Water reuse.
Identifiers: Radishes.

The use of hydroponics in a municipal waste water reuse process was evaluated. Tomatoes and radishes were grown in five beds irrigated as follows: irradiated waste water from a Cobalt 60 facility; potassium nitrate added to waste water before irradiation; KNO3 added to waste water after irradiation, and untreated waste water as a control. Growth in the effluent after chlorination was one quarter of that in the control and was repressed when KNO3 was added to irradiated effluent. Radishes grown in irradiated waste water were appreciably heavier than any crops other than that grown as the control. Tomatoes also grew best in irradiated waste water, but seemed to do better when there was a higher concentration of nitrogen as nitrate. They grew poorly in chlorinated waste water, achieving only one third the weight of the controls. It is concluded that hydroponics, in its present state of development, is readily adaptable to the use of waste water treatment plant effluents, probably removing plant nutrients which might otherwise become pollutants, as well as producing foodstuffs economically. Further, a repeated use of otherwise lost water can be accomplished. (Merritt-FIRL)

SEWER-WITHIN-SEWER SAVES CITY $400,000,
A. W. Nester.
The American City, Vol 89, No 2, p 45-46, February, 1974.

Descriptors: Engineering structures, Sewers, *Combined sewers, *Separated sewers, Manholes, Pipes, *Storm drains, Tunnels, *Urban drainage, *Michigan.
Identifiers: *Flint(MI).

The city of Flint, Michigan effected the separation of 1800 feet of combined sewers by putting a pipe within a pipe, thus saving the city $400,000. The cost of open-cut or tunneling for separating the sewers was $600,000. A 14in. sanitary sewer line was laid in the invert of the old pipe, a cast-in-place, elliptical concrete pipe 60in. high and 40in. wide. The sanitary sewer connections were tied into it, and the line was covered with concrete. First, the combined sewer was cleaned. By working from manhole to manhole, a Transite asbestos-cement pipe was placed one eight foot section at a time. The sections were connected with pressure joints. Sanitary leads from buildings were tapped into the new sewer; new leads were routed along the interior wall contour of the old pipe and were fastened with stainless steel straps and anchors. Quick-set mortar sealant prevented leakage of sanitary sewage into the storm sewer during construction. When the sewer was in place, it was concreted over with 3500psi concrete. (Murphy-FIRL)

USE OF PIPELINES AS AEROBIC BIOLOGICAL REACTORS,
General Electric Co., Philadelphia, Pa.
C. M. Koch, and I. Zandi.
Journal of the Water Pollution Control Federation, Vol 15, No 12, p 2537-2549, December, 1973. 2 fig, 1 tab, 19 ref.

Descriptors: Engineering structures, *Sewers, *Treatment facilities, *Biochemical oxygen demand, Water pollution, Municipal wastes, *Aerobic treatment, *Wastewater treatment, *Mathematical models, Model studies.

Sewerage systems of many cities comprise both pressure and gravity lines. It has been suggested that these lines may be used as aerobic biological reactors to reduce the biochemical oxygen demand on treatment facilities. The utilization of the pipelines as a treatment facility to stabilize the organic portion of solid waste while it is being conveyed in slurry form has also been proposed. Stabilization of the combined solid waste and wastewater is another possibility. If the converted conduits are relatively long, the BOD reduction may be considerable. An analysis of pressure pipeline reactors, sometimes called tubular reactors, with the view towards using pressure pipelines as aerobic biological treatment facilities is presented. A mathematical model and a case study are developed. Parameters considered are wastewater flowrate, initial pressure head, seed inoculum concentration, pipe diameter, gas flow rate, air to slurry ratio, DO concentration, gaseous oxygen concentration, initial BOD, temperature, pumping station location with respect to pressure, and gas injection commencement when the DO levels fall below a given value. Also considered were the biological kinetic constants for municipal wastewater. The economic practicality of this form of treatment was not considered, but it was shown that BOD reduction could be effected. (Murphy-FIRL)

PURE WATERS PROJECT INCLUDES RESTORATION,
R. Dyment.
Water and Sewage Works, Vol 121, No 3, p 52-53, March, 1974.

Descriptors: Water pollution, Water resources development, Water treatment, *Project planning, Projects, Management, Water management(Applied), *Treatment facilities, Methods, *New York, *Lake Ontario, Great Lakes, *Sewers, *Wastewater treatment.
Identifiers: *Monroe County(NY).

Monroe County, New York began a pure waters program in 1970 that will cost $400 million by the time it is completed in 1975. It includes the laying of hundreds of miles of sewer lines, constructing four treatment plants, tearing up streets and private land, and restoring whatever was disturbed to its original state. Lake Ontario and other water bodies in Monroe County are polluted to degrees varying from severe to moderate, with population growth increasing rapidly, thus adding to the pollution problems. The county was divided into four regions according to drainage basins, and sewer networks and treatment plants constructed accordingly. The new treatment plants will provide a minimum of secondary treatment of wastewater. Attempts have been made to minimize the ecological disruptions during the construction of the sewers and treatment plants. (Murphy-FIRL)

LINEARLY DECREASING VELOCITY - WEIRS,
College of Engineering, Madras (India). Dept. of Hydraulics and Water Resources.
D. Chandrasekaran, and N. S. L. Rao.
Surveyor, No 4263, p 30-32, February, 1974. 3 fig, 3 ref.

Descriptors: Engineering structures, Sewers, *Weirs, Control, *Sediments, Treatment facilities, *Wastewater treatment, *Sewage treatment, *Settling basins.
Identifiers: Proportional weirs, Grit chambers.

The problem of settling of sediment particles is important in sewage treatment units as in grit chambers, water purification works and in the treatments of a variety of industrial wastes. Among the many factors that affect settling, the mean velocity of flow can be readily controlled by the designer by fixing suitably designed weirs at the outlets of sedimentation chambers. The exact design of such a weir is presented. The type of proportional weirs presented have potential as velocity controlling devices and are capable of trapping sediments to a removal efficiency of 60 to 85%. (Murphy-FIRL)

DIRECT-FILTRATION STUDIES FOR METROPOLITAN TORONTO,
Proctor and Redfern, Toronto (Ontario).
R. G. Tredgett.
Journal of the American Water Works Association, Vol 66, No 2, p 103-109, February, 1974. 6 fig, 5 tab, 17 ref.

Descriptors: *Water treatment, *Treatment facilities, *Filtration, *Municipal wastes, Water quality, *Flocculation, *Lake Ontario, Great Lakes, Computers, Data processing, *Canada, *Wastewater treatment.
Identifiers: *Toronto.

The Municipality of Toronto will solve an unusual water treatment requirement with a plant addition of modified design for $4.8 million less than the cost of a conventionally designed plant. The old 72mgd plant, located on an offshore island in Lake Ontario, is to be doubled in size. The plant has been operating since 1911 but now only operates seasonally to meet peak summer demands. It has kept detailed records of the raw water quality. Analysis of these, assisted by a computer, supported the possibility of direct filtration. Pilot studies confirmed that efficient filtration at high rates was feasible and that flocculation and settling basins could be eliminated. The new plant will incorporate these features with significant savings. The size and quality of the floc produced for filtration is critical to this design. Whereas settling requires a large flow, high-rate direct filtration requires a strong, pinpoint floc barely visible to the eye. Although the requirements of the new plant are unusual, the principles leading to its design are quite basic and may be of interest in the Great Lakes area or any area with good quality raw water. (Murphy-FIRL)
W74-10928

ARTIFICIAL AQUIFER STOPS STORM POLLUTION.
The American City, Vol 89, No 5, p 106, May, 1974.

Descriptors: *Combined sewers, *Aquifers, *Plastics, *Wastewater treatment, *Storm runoff, *Sewage treatment, *Ohio, Municipal wastes, Cities, Stormwater, Stormflow, Costs, Clarification.
Identifiers: *Stormflow treatment, Clarification-chlorination basin.

Akron, OH has solved the problem of combined storm and sanitary sewers by an underground, plastic-encased artificial aquifer. This is both effective and inexpensive. Stormflows are diverted into a clarifier where waste water is settled and chlorinated. It is then stored in the plastic aquifer until it can be accepted at the sewage treatment plant. Surface land above this underground cell may still be used for other purposes, thus eliminating land acquisition costs. (Prague-FIRL)
W74-10929

MEMBRANES FOR REVERSE OSMOSIS,
United Kingdom Atomic Energy Authority, London (England). (assignee).
D. Walmsley.
U.S. Patent 3,807,571. Issued April 30, 1974. Official Gazette of the U.S. Patent Office, Vol 921, No 5, p 1911, April 30, 1974. 1 fig.

Descriptors: *Patents, *Reverse osmosis, *Wastewater treatment, *Membranes, *Cellulose.
Identifiers: *Cellulose acetate.

A cellulose acetate reverse osmosis membrane, a method of making such a membrane by casting, and a solution suitable for use in casting such a membrane are described. The particular features lie in the selection of a narrow range of acetyl values for the cellulose acetate, obtained by blending cellulose acetates having acetyl values falling outside the selected range, and in the composition of the casting solution which includes acetone dioxan and formamide. The membranes of the invention are further characterized in having Indices of Performance (IOP) of at least 50; frequently the IOP is higher than 100. (Murphy-FIRL)
W74-10932

METHOD AND APPARATUS FOR THE TREATMENT OF INFLUENT WATERS SUCH AS SEWAGE,
M. E. Neel.
U.S. Patent 3,808,123. Issued April 30, 1974. Official Gazette of the U.S. Patent Office, Vol 921, No 5, p 2047, April 30, 1974. 1 fig.

Descriptors: *Patents, *Wastewater treatment, *Oxidation, *Sewage treatment, *Aeration, Odor.

A method and apparatus are described for treating influent waters such as sewage, waste water, discharges from petroleum or chemical plants, or other materials requiring oxidation. A pressure vessel is utilized into which the influent waters are moved under pressure. The pressure within each vessel is maintained within a desired range, and an oxygen stream is pumped into the influent waters. To insure proper contact with the oxygen, detention time within the vessel is provided. Fine bubble diffusers are used to inject the oxygen stream; these diffusers are spaced at various locations and if desired at varying levels within the vessel. Means are provided to vary the quantity of the oxygen stream introduced into the vessel at various points, as well as to vary the percentage of oxygen in the oxygen stream itself. The apparatus and method may be employed at various locations in a sewer system as intermediate steps to prevent excessive build-up of odor or corrosion, or with additional equipment, such as tapered aeration tanks, or aeration tanks, or aerobic digesters, to form a complete treatment plant. (Murphy-FIRL)

DIGESTION BYPRODUCT MAY GIVE ANSWER TO ENERGY PROBLEM,
Knoerle, Bender, Stone and Associates, Chicago, Ill.
J. Goeppner, and D. E. Hasselmann.
Water and Wastes Engineering, Vol 11, No 4, p 30-35, April, 1974. 6 fig, 1 tab.

Descriptors: Energy, *Methane, *Anaerobic digestion, *Sludge digestion, Sewage, *Wastewater treatment, Waste disposal, *Byproducts, Treatment facilities.
Identifiers: *Energy sources.

The methane gas which is produced during the anaerobic digestion of sludge is discussed as a possible source of energy. The volume of methane generated in anaerobic digestion is dependent upon the nature and volume of the wastes. Current data indicate that 15 to 20 cu ft of gas are produced per pound of volatile organic material destroyed. The gas produced by fermentation contains about 60-70% methane; carbon dioxide is the predominant remaining constituent. From 100 gal of sewage it would be theoretically possible to obtain more than one cubic foot of combustible gas having a heating value of 650 BTU. Construction costs of digestion units are integral in determining economic feasibility of such an energy source. It was found that for fuel generation alone anaerobic digestion would not be economically possible. However, the process can be used to affect the use of outside procured energy to operate the treatment plant. The possibility of using this process with animal wastes is explored. The estimated electrical power capacity potentially available from the wastes of 12 million beef cattle represents about one percent of the total U.S. capacity. Assets of this system of energy production are ease of storage of digester gas, and ease of transport. Anaerobic digestion facilities at existing sewage treatment plants incorporate design features which are compatible with adoption of gas recovery systems. (Murphy-FIRL)
W74-10935

PROBLEMS ON POLLUTION AND WATER RESOURCES IN THE NEW YORK CITY METROPOLITAN AREA,
New York City Dept. of Water Resources.
M. Lang.
Hudson River Colloquium, Annals of the New York Academy of Sciences, Vol 250, p 178-181, May 24, 1974.

Descriptors: *Waste water treatment, *Storm drains, *Storm water, Ecosystems, Financing, New York, Costs, Municipal wastes, Sewage treatment.
Identifiers: *Ecological analysis, Ecological monitoring, *New York City.

The size and scope of New York's sewage treatment effort are discussed. The City has made substantial progress toward its goal of high-degree secondary treatment. Of the 1.5 billion gallons/day of sewage in the city, 75 percent currently receive secondary treatment. The other 25 percent is discharged untreated into the estuary, principally from the west side of Manhattan. The city has currently embarked on a program to construct two new treatment plants and upgrade 12 existing ones, the cost of which is estimated to be $2.3 billion. Plans for a storm water treatment plant on the shore of Jamaica Bay are discussed as well as a comprehensive ecological analysis and monitoring program for the bay and parts of the estuary. A more detailed breakdown of expenditures on the basis of Federal, state, and local shares is also given. (Shaffer-FIRL)
W74-10942

IIAGARA FALLS WATER PLANT CONVERTS GRAVITY FILTERS HYDRAULICALLY.
Vater and Pollution Control, Vol 112, No 4, p 66-7, April, 1974. 3 fig.

Descriptors: *Filters, Hydraulics, *Gravity, Treatment facilities, Sands, Gravel, *Canada, Municipal water, Sewage treatment, *Waste water reatment, *Filtration.
Identifiers: *Dual media filters, *Niagara Falls(Ontario), Anthrafilt system.

Niagara Falls (Ontario) sewage treatment plant of 6 rapid gravity filters and maximum capacity of 0 million Imperial gallons per day was having its utput impeded by a sluggish rate of filtration. It vas necessary to improve this rate without acrificing water quality. Consulting engineers ecommended that the 8 new filters in the exanded portion of the plant be operated at 4 gal/sq /minute (twice the original rate); the eight older lters be operated at 1 gal/sq ft/minute; and each f the two settling tanks be operated at rates that ould give comparable effluent quality. The new lters were converted to the dual media type. The ual media configuration gives the following struc-ire: anthrafilt on top, a layer of sand below this, a ayer of gravel below the sand which is underlaid y the draining system. Unfortunately, in this case ie anthrafilt was already in place and it was ecessary to devise a way of introducing the sand ayer beneath the anthrafilt with minimum isturbance to the filter. This was done by placing and on top of the anthrafilt and then using a ackwash flow (gradually increasing in rate with me) to fluidize the two media which then sorted iemselves properly with the sand ending up eneath the anthrafilt. (Shaffer-FIRL)
W74-10943

TUCSON TACKLES TWO PROBLEMS.
Vater and Wastes Engineering, Vol 11, No 5, p 66, May, 1974.

Descriptors: *Water reuse, *Waste water treatment, *Irrigation, Costs, Efficiencies, Water conservation, *Arizona, Treatment facilities, Cities.
Identifiers: *Tucson(Ariz).

A $1.5 million waste water reclamation plant, now eing built by the city of Tucson, Arizona, will opefully eliminate two problems for that city. First, the new plant will help relieve the present verload on one of the main 10 inch sewer lines erving the rapidly growing southeast side of the ity. Secondly, it will provide irrigation water for ie city's two golf courses. Currently, irrigation vater for these golf courses is purchased from the ity water department. The new practice will be heaper and will conserve 547.5 million gallons per ear of precious groundwater supplies in this esert region. A brief summary of the plants peration and hardware is included. (Shaffer-FIRL)

THE PRESSURE SEWER: A NEW ALTERNATIVE TO THE GRAVITY SEWER,
New York State Dept. of Environmental Conservation, Albany.
. G. Carcich, L. J. Hetling, and R. P. Farrell.
Civil Engineering-ASCE, Vol 44, No 5, p 50-53, May 1974, 6 fig.

Descriptors: *Sewers, *Waste disposal, Costs, Groundwater, Infiltration, Pressure, *New York, Pumps, *Waste water treatment.
Identifiers: *Pressure sewers, *Albany(NY), Grinder pumps.

The key to a new pressure sewer system is the rinder pump. Placed in the basement of the ouse, the pump grinds up large particles in the ousehold sewage and discharges this fluid to a mall diameter pressure sewer. The chief advantages gained by use of such a system are the reduction in sewer installation costs (the pipe need only be laid just below ground level); and elimination of groundwater infiltration. In testing performed in the Albany, New York area it was found that pressure-sewer waste was 100 percent stronger on a concentration basis, yet 50 percent less contaminants were in the water on a gm/capita/day basis than in conventional gravity sewer waste water. Sewage volume was 2/3 lower on a per capita basis than for conventional systems, primarily due to the elimination of groundwater infiltration. The small diameter pressure sewer appears to be a proven technology. More than 20 projects using this type of system are either in operation, under construction, or being designed. (Shaffer-FIRL)

SENSORS FOR WATER AND WASTEWATER PROCESS CONTROL,
North Carolina Univ., Raleigh. Dept. of Environmental Sciences and Engineering.
J. D. Johnson.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 44-46, 1974.

Descriptors: *Monitoring, *Sampling, *Waste water treatment, *Water treatment, Water analysis, On-site investigations, On-site data collections, *Pollutant identification.

Proper design of water and waste treatment process monitoring requires selection of the most meaningful parameters for the control of the process. Obtaining a representative sample from a process stream is just as difficult as obtaining a representative sample from a lake or a river. Vertical, horizontal and longitudinal variations in flow patterns are typical in both plug flow and completely stirred reactor system. For this reason in situ measurements are generally more desirable than collection of the sample for the performance of the analysis at another location. It is important to measure both activity and concentration and to control these processes in water treatment practice. Examples are the control of oxygen. The partial pressure, an activity measurement, is the most important parameter in the activitated sludge process while the total quantity of oxygen as determined by Winkler titration is most important in a waste effluent discharged to a stream. The oxygen activity determines the biological activity of the process while the concentration determines the volumetric impact of the low oxygen water on the stream. Many electro-chemical sensors like the glass electrode and the oxygen electrode are now available which measure activity directly when properly calibrated. (See also W74-10947) (Knapp-USGS)

WASTE WATER MONITORING PROGRAM BY THE CITY OF NEW YORK,
New York City Environmental Protection Administration. Dept. of Water Resources.
S. L. Kirschner, E. O. Wagner, and M. Lang.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 61-66, 1974. 2 fig, 1 tab.

Descriptors: *Monitoring, *Sampling, *Waste water treatment, New York, Sewage, Sewage treatment, Laboratory tests.
Identifiers: *New York City.

The City of New York monitors waste water treatment plant operations. New York Harbor is sampled during the summer for a minimum of 12 weeks (four days a week). Top and bottom grab samples at more than 40 locations are obtained and analyzed for temperature, salinity, BOD, dissolved oxygen (DO) and total coliforms (MPN). Four process control laboratories service the 13 treatment plants. Samples are obtained from raw sewage, primary effluent, aerator effluent, thickener effluent, final tank effluent, return sludges and digested sludge and analyzed for suspended solids (SS) and BOD. Volatile acids, alkalinity, pH, methane, CO2, and H2S are routinely measured on digester samples. Chlorides, temperature and pH are also measured on the raw sewage. The City has established limits for some toxic industrial discharges to the sewer system. Waste waters are routinely analyzed for pH, Cd, Cr, CN, Cu, Hg, Ni, BOD and SS. (See also W74-10947) (Knapp-USGS)
W74-10962

AUTOMATED WET CHEMICAL ANALYSIS INSTRUMENTS FOR CONTINUOUS EFFLUENT MONITORING,
Technicon Industrial Systems, Tarrytown, N.Y.
R. D. Goldberg.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 111-118, 1974. 7 fig.

Descriptors: *Monitoring, *Water pollution control, *Waste water treatment, Automation, Sampling, *Pollutant identification, Chemical analysis, Water analysis.

Continuous flow, automatic chemical analysis is a powerful new tool which will permit specific chemical monitoring functions directly in the plant, continuously and with considerable speed and ease. Automated tests, whether performed on discrete samples in the laboratory or continuously for monitoring or process control in the plant or on waterways are more accurate and precise than the equivalent manual tests. Automated analyses costs are usually much lower than conventional testing costs. In the more complex applications these instruments are used to maintain optimum conditions in the manufacturing process or waste treatment process to insure that the presence of pollutants is held to an acceptable minimum at the plant's outfall. MUSKEGON COUNTY WASTEWATER MANAGEMENT SYSTEM NO I,
Teledyne Triple R, Muskegon, Mich.
Y. A. Demirjian.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 135-154. 1974. 7 fig, 6 tab, 16 ref.

Descriptors: *Waste water treatment, *Irrigation water, *Waste water disposal, Irrigation, Sprinkler irrigation, *Michigan, *Water reuse.
Identifiers: *Land disposal(Wastes), *Muskegon(Mich).

The largest land wastewater treatment facility in operation in the United States is the Muskegon County Wastewater Management System No. 1. The BOD load is being reduced by 90%; the COD load is being reduced by 75%, and the BOD to COD ratio is 1:4. There is no substantial drop in the metal levels in the treated water. The phosphate and ammonia levels drop during the treatment process while nitrate levels show a gradual increase during the treatment process. In

general, the level of nutrients is low in this system, averaging 3 mg/liter of phosphates and nitrate. Irrigated drained water shows substantial improvement in quality. Agricultural studies indicate a 100-400% increase in yield potential of various soils due to irrigation. (See also W74-10947) (Knapp-USGS)
W74-10976

INDUSTRIAL WASTEWATER MONITORING: BASIC CONSIDERATIONS,
Tennessee Univ., Knoxville.
P. A. Pagoria.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 157-164, 1974.

Descriptors: *Monitoring, *Water pollution control, *Industrial wastes, Federal water pollution control act.

Waste water may be monitored to provide information for design and operation of treatment facilities, to provide information to aid in computing process material balances for process control, to serve as a basis for computing user charges or surcharges where industrial wastewaters are discharged into municipal wastewater systems, to provide a record of compliance (or non-compliance) with effluent standards, and to provide records which can serve as a basis for defense in legal actions. Most industries not presently involved in monitoring programs will be involved in the very near future as dictated by the Federal Water Pollution Control Act Amendments of 1972. The basics of measuring flows, sampling techniques, analysis techniques, and continuous monitoring systems are reviewed to help those concerned to develop the most suitable system to fit their particular needs. (See also W74-10947) (Knapp-USGS)
W74-10978

WASTE AND WATER MONITORING,
Dow Chemical Co., Midland, Mich.
C. E. Hamilton.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 165-168, 1974. 2 tab.

Descriptors: *Monitoring, *Water quality, Waste water treatment, Industrial water, Industrial wastes, Water pollution control.

A water and waste monitoring program in a chemical plant measures and controls water quality for the process uses, process wastes, treatment facilities loading, treatment evaluation, plant effluents, and the receiving stream. Many parameters are measured by continuous or continual automatic instrumental systems. Monitoring data from remote locations are recorded locally and telemetered to a central instrument panel in the treatment plant. A total of about 250 million gallons per day of three different waters and one waste water are influent to the plant. Most of this water is used only for cooling, but about 60 million gallons per day is used in processes which generally contaminate it with some amount of a wide variety of organic and inorganic chemicals. Many of these impurities are removed by a secondary biological treatment plant. The problem is especially critical in that the quality of the river downstream under low-flow conditions can be essentially that of the combined effluents. (See also W74-10947) (Knapp-USGS)
W74-10979

DETERMINATION OF CHLORINATION EFFECTS ON ORGANIC CONSTITUENTS IN SEWAGE TREATMENT PLANT EFFLUENTS: A COUPLED 36CL TRACER--HIGH-RESOLUTION CHROMATOGRAPHIC TECHNIQUE,
Oak Ridge National Lab., Tenn.
R. L. Jolley.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 256-264, 1974. 2 fig, 2 tab, 20 ref.

Descriptors: *Chlorination, *Chemical analysis, *Tracers, *Gas chromatography, Chlorine, Analytical techniques, *Sewage treatment, *Waste water treatment, Disinfection, Organic compounds, Path of pollutants.

Chlorination effects on complex, microgram-per-liter solutions of organic compounds at milligram-per-liter chlorine concentrations, in effluents of sewage treatment plants, were studied using Cl-36 radioactive tracers with high-resolution chromatography. Over 40 chlorine-containing organic compounds were chromatographically separated from a chlorinated primary effluent of a domestic sanitary sewage treatment plant. (See also W74-10947) (Knapp-USGS)

LIGHT ENERGIZED OXIDATION OF ORGANIC WASTES,
Montana State Univ., Bozeman. Dept. of Civil Engineering and Engineering Mechanics.
J. W. Sargent, and R. L. Sanks.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 265-272, 1974. 8 fig, 8 ref.

Descriptors: *Organic wastes, *Waste water treatment, Organic compounds, *Oxidation, *Aerobic treatment, Aeration, Industrial wastes.
Identifiers: *Dye-sensitized photo-oxidation, Cresols.

Dye-sensitized aerobic photo-oxidation is a process by which many organic compounds can be oxidized chemically in the presence of a photo-sensitizing dye, visible light and molecular oxygen. In water solution, the sensitizer dye absorbs energy from visible light and transfers it to the oxygen-substrate reaction system where photo-oxidation occurs. The dye can be removed from reuse and only light energy, energy for aeration, and molecular oxygen are spent. Many of the substances found in domestic and industrial wastes (including refractory organics such as phenols, cresols, TNT, and unsaturated nitriles) should be susceptible to photo-oxidation. Most microorganisms, including viruses, can be killed by low concentrations of photo-sensitizing dyes in the presence of light and oxygen. Methylene blue, a readily available dye, is an effective sensitizer for cresol photo-oxidation and would likely sensitize photo-oxidation of other refractory molecules. The photolysis of cresol occurs as much as 2.8 times faster in an aerobic system than in an anaerobic system. (See also W74-10947) (Knapp-USGS)

CHEMICAL PROFILES OF KRAFT PAPER MILL TREATED WASTEWATERS,
Environmental Protection Agency, Athens, Ga. Southeast Environmental Research Lab.
L. H. Keith.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 278-281, 1974. 2 fig.

Descriptors: *Waste water treatment, *Pollutant identification, Organic compounds, *Pulp wastes, *Industrial wastes, *Organic wastes, Phenols, Organic acids.

In the effluents of two unbleached-kraft paper mills, specific compounds were identified using gas chromatography and mass spectrometry. The primary clarifier exerted little change on the composition or concentration of dissolved organics. The trickling biofilter was effective for reducing the phenolic content but exerted little influence on the other dissolved organics. The aerated lagoon reduced some of the terpene content but most of the terpenes and other neutral compounds remained in 50% or more of their original concentrations. Some fatty and resin acid concentrations were reduced by the lagoon, but more were apparently increased in concentration and a number of new compounds, possibly aquatic life metabolites, appeared during this stage of treatment. Lime flocculation reduced neutral compounds to less than 50% of their original concentration, possibly as a result of adsorption. Lime flocculation had little effect on phenols, but it did cause some reduction of fatty and resin acids. The large biological stabilization pond greatly reduced the phenolic concentration and substantially reduced the concentration of most terpenes and other neutral compounds. Resin acids and terpenes were resistant to both treatments. Phenols as a class were susceptible to both treatments but traces of them could still be found in the fully treated effluents. The more highly substituted phenols were more resistant. (See also W74-10947) (Knapp-USGS)
W74-10992

COAL HUMATES FOR THE REMOVAL OF WATER POLLUTANTS ASSOCIATED WITH THE USE OF COAL,
Missouri Univ., Columbia. Dept. of Chemistry.
S. Harlan, J. Green, and S. Manahan.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 282-284, 1974. OWRR B-095-MO(2).

Descriptors: *Water pollution control, *Air pollution, *Humic acids, *Coal mine wastes, *Acid mine water, Sulfates, Trace elements, Heavy metals, Chelation, Sorption, *Waste water treatment.

Humic substances prepared from coal show considerable potential for the removal from water of several important pollutants arising from coal. Coal humates have acid-base properties and in the basic form are very effective in neutralizing acidity in water. They are chelating materials and bind strongly to a number of heavy metals and iron. Coal humates in the basic form should be effective in absorbing sulfur dioxide from stack gas. The acid-insoluble coal humic acids have potential for sorbing organic pollutants and entraining fine particles. Some of the most common methods for the preparation of coal humates are alternate exposure to air and base, alternate exposure to acidic oxidizing agents and base, and continuous treatment with an oxidizing agent such as air or permanganate in a basic medium. VALUATION OF A MULTIFILTRATION VATER RECLAMATION SUBSYSTEM TO ECLAIM DOMESTIC CLOTHES WASH VATER,
ational Aeronautics and Space Administration, angley Station, Va. Langley Research Center.
B. Hall, Jr.
vailable from NTIS, Springfield, Va. 22161 as ASA TM X-2781, Price $3.00 printed copy; $2.25 icrofiche. Technical Memorandum X-2781, May 73. 25 p, 2 fig, 4 tab, 4 ref, 3 append.

escriptors: *Water reuse, *Filtration, *Waste ater treatment, *Domestic wastes, Phosphates, acteria, Detergents, Surfactants, Filters, Reclaimed water.
entifiers: *Washing machine wastes.

multifiltration water reclamation subsystem was sted to determine its capability to recover water om domestic clothes wash water. A total of 32.89 of clothes were washed during eight wash cy-es which used 0.635 kg of detergent, 549 liters of ot water and 507 liters of cold water. Water covered at a weighted average process rate of .42 liters per hour met the majority of the 23 quirements established for potable water by the .S. Public Health Service. Average power con-med during this evaluation was approximately .8 watt-hours per liter of water recovered. Filter replacement, which was required primarily for the control of micro-organisms in the recovered water, averaged 4.86 filters per 379 liters of wash water processed. The subsystem removed approx-imately 98 percent and virtually 100 percent of the phosphates and surfactants, respectively, from the wash water. (Knapp-USGS)

COMPUTER SIMULATION OF WASTE WATER TREATMENT BY CHEMICAL-PHYSICAL PROCESSES,
Envirotech Corp., Palo Alto, Calif. Municipal Equipment Div.
A. Anand, J. Gibbs, W. C. Laughlin, Jr., and R. J. Sherwood.
Effluent and Water Treatment Journal, Vol 14, No 3, p 155-160, March 1974. 2 fig, 3 tab, 5 ref.

Descriptors: *Computer models, *Simulation analysis, *Waste water treatment, *Water quality control, Design, Operations, Costs, Municipal water, Wastes, Systems analysis.
Identifiers: *Chemical-physical treatment, Flow sheet, Sensitivity analysis, Sizing, Material balance, Economic analysis.

Chemical-physical waste water treatment (CPT) has become a viable alternative to conventional biological plus tertiary processes. But experience in CPT is limited and the processes themselves raise quite a number of complex design, cost, and operation questions making proper analysis difficult. Described in detail is a program of computer simulation models which offers the flexibility to consider alternative waste water treatment flowsheets, design criteria, costs, and operating parameters and provides the power to analyze these with an exactness and speed impossible to achieve by hand calculation. The program is assessed through timesharing, which allows for cost savings and for writing the program in a conversational mode. Two sources of input provide flexibility: description of the waste water stream entering the flowsheet selected by the user; and a table of data including 550 parameters representing every possible variable that can affect the design and analysis of a complete chemical-physical treatment system. Setting the framework for a material balance, sizing the unit processes governed by the design criteria, and economic analysis of equipment, operating and installed costs are discussed. Performance of sensitivity analysis on design and process parameters is considered. The CPT Simulation Program is a powerful and necessary tool in the proper analysis of chemical-physical treatment. WATER AERATION EQUIPMENT,
Gulf Oil Corp., Pittsburgh, Pa. (Assignee)
N. R. Whitaker.
U.S. Patent No. 3,807,712, 3 p, 2 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 921, No 5, p 1948, April 30, 1974.

Descriptors: *Patents, *Aeration, *Waste water treatment, *Pollution abatement, Water quality control, Water pollution control, Equipment.

A horizontal cylindrical soaker tank has a vertical cylindrical contactor extending upward from it. Within the contactor are a plurality of vertically spaced horizontal discs mounted on a vertical rotating shaft. Surrounding each disc and adapted to intercept water discharged from the edge of the disc is a vertical sleeve. Water delivered onto each disc is either discharged from the outer edge of the disc against the shell sleeve or falls through openings in the disc to a lower disc. Water flowing down the surfaces of the shell and sleeves is contacted by air delivered under pressure into the contactor. Water draining from the sleeves into the soaker is held under pressure in the soaker to give additional time for adsorption of air. (Sinha-OEIS)

PURIFYING PLANT FOR SEWAGE,
J. Bosje.
U.S. Patent No. 3,809,242, 3 p, 2 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 922, No 1, p 178, May 7, 1974.

Descriptors: *Patents, *Wastewater treatment, *Aeration, *Sewage treatment, *Activated sludge, *Pollution abatement, Water quality control, Water pollution control, Equipment.

A purifying plant for sewage includes an open topped curved tank having an elongated aerating space so shaped that its end walls are located adjacent to each other. The aerating space is partitioned forming an inner channel enclosed within an outer channel in series so that an endless aerating channel is formed. There is a settling chamber in the inner channel for settling out sludge. (Sinha-OEIS)
W74-11052

SEWAGE TREATMENT APPARATUS,
S. R. Kennedy.
U.S. Patent No. 3,809,245, 5 p, 3 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 922, No 1, p 179, May 7, 1974.

Descriptors: *Patents, *Sewage treatment, *Aeration, *Pollution abatement, Water quality control, Water pollution control, *Wastewater treatment, Equipment.

The apparatus comprises a primary liquid circulation chamber in which sewage is circulated around a curved circulation guide barrier that shields an outlet port. Pressurized air is introduced into the chamber. The sludge that is present in the liquid tends to move radially away from the outlet port. The radially moving sludge tends to sink to the bottom of the primary circulation chamber and is drawn outward by suction. Liquid passing through the outlet port enters a flowage chamber, then a second circulation chamber. In the second chamber a scum-collection trough removes the scum floating on the liquid surface. Following secondary circulation the liquid passes into a collection chamber that pools the circulated liquid. The collection chamber includes weirs for skimming a surface layer of the polled water and drainage pipes associated with the weirs for finally removing the skimmed liquid from the sewage treatment apparatus. (Sinha-OEIS)

SELECTIVE ADSORPTION OF PHENOLS FROM SOLUTION IN WATER,
Texaco, Inc., New York. (assignee).
F. C. McCoy, and R. C. Schlicht.

Descriptors: *Patents, *Phenols, *Waste water treatment, Pollution abatement, Foam separation, Effluents, Water quality control, Water pollution control.
Identifiers: *Chemical treatment, *Refinery wastes, Polyurethane foam.

To recovery phenolic materials from waste water the steps comprise contacting the waste water with a polyurethane foam in the presence of hydrophilic fibers at a temperature in the range of 35 to 200 deg F for a substantial time. The clarified or purified water may subsequently be drawn out. (Sinha-OEIS)
W74-11063

PROCESS FOR TREATING DOMESTIC AND INDUSTRIAL LIQUID WASTES,
G. M. Chappeil.
U S Patent No 3,812,032, 7 p, 2 fig, 1 tab, 7 ref; Official Gazette of the United States Patent Office, Vol 922, No 3, p 896, May 21, 1974.

Descriptors: *Patents, *Waste water treatment, *Biochemical oxygen demand, Water pollution control, Water quality control, Pollution abatement, *Aeration, Industrial wastes, Liquid wastes, Domestic wastes, Aerobic bacteria, Anaerobic bacteria.
Identifiers: *Chemical treatment.

A process for treating liquid wastes involves adding a sufficient amount of acid formula and an alkaline formula to cause the evolution of heat and the flocculation of solids. The resulting mixture is then aerated during at least a portion of the time period in which heat is evolved. The solids and liquids are separated and recovered. The acid formulae comprise: about 30-98 weight percent aluminum sulfate, about 2-20 weight percent of an alkali metal chloride, and, about 0.0005-0.1 weight percent of sodium or potassium hypochlorite. The alkaline formulae comprise about 10-25 weight percent aluminum sulfate, about 35-60 weight percent sodium aluminate, about 15-35 weight percent sodium hydroxide, about 1-10 weight percent of an alkali metal chloride, about 0.5-4 weight percent sodium or potassium hypochlorite, about 1-7 weight percent alkali metal nitrate, about 0.25-5 weight percent of an alkali metal carbonate, and about 0.25-5 weight percent of an alkali metal bicarbonate. (Sinha-OEIS)

ENGINEERING ASPECTS OF WASTE WATER TREATMENT IN AERATED RING-SHAPED CHANNELS,
Technion - Israel Inst. of Tech., Haifa.
Y. Argaman, and E. Spivak.
Water Research, Vol 8, No 5, p 317-322, May, 1974. 4 fig, 2 tab, 5 ref.

Descriptors: *Treatment facilities, *Oxidation lagoons, *Waste water treatment, *Design criteria, Aeration, Hydraulics, Channel flow, Channel morphology, Oxygenation, Flow rates, Suspended solids, Pumping, Reaeration.

Ring-shaped aerated channels may be used for waste water treatment as oxidation ditches, aerated lagoons, or high-rate ponds. The aerators utilized in these systems provide the necessary oxygen and generate a flow velocity that will keep particulate matter in suspension. When mechanical surface aerators are used, the flow velocity and the oxygen supply rate depend on the channel geometry and the aerator rotation speed and submergence. A design procedure that will simultaneously satisfy oxygen and flow requirements is presented. It involves process kinetics, open-channel flow hydraulics, and aerator performance aspects. Experiments in a pilot aeration channel, operated as a high-rate pond, indicate that the minimum flow velocity for such systems is between 3.5 and 6.5 cm/sec when the suspended solids concentration is about 500 mg/liter. The pumping efficiency of a 70 cm wide cage rotor aerator was about 4% when the submergence depth was 12-17 cm. Calculations show that atmospheric reaeration, induced by high flow velocity, is not economical. On the other hand, a combination of a pump and an aerator may prove feasible in cases where flow velocity rather than oxygen supply is the limiting factor. (Witt-IPC)
W74-11065

MODERN PROCESSES OF SLUDGE DEWATERING (MODERNE VERFAHREN ZUR SCHLAMMENTWAESSERUNG),
A. Wohlfarter.
Wochenblatt fuer Papierfabrikation, Vol 101, No 17, p 624-627, Sept. 15, 1973. 9 fig, 1 tab.

Descriptors: *Treatment facilities, *Pulp wastes, *Sludge treatment, *Dewatering, Pulp and paper industry, Filters, Flocculation.

A general review of sludge dewatering principles and processes and of appropriate equipment, such as vacuum and pressure filters, emphasizes a two-wire dewatering press developed by Andritz Machinery Works of Austria. Some illustrative data are included on the dryness content of the filter cake as a function of press throughput and addition of flocculants in the dewatering of a fine-paper mill sludge. DYNAMIC MODELS AND CONTROL STRATEGIES FOR WASTE WATER TREATMENT PROCESSES,
Clemson Univ., S.C. Dept. of Environmental Systems Engineering.
J. F. Andrews.
Water Research, Vol 8, No 5, p 261-289, May, 1974. 30 fig, 49 ref.

Descriptors: *Waste water treatment, *Control systems, *Simulation analysis, *Mathematical models, *Computer models, Digital computers, Model studies, Activated sludge, Anaerobic digestion, Operations research, Operating costs, Reliability, Computer programs, Systems analysis.

Consideration of dynamic behavior and the incorporation of modern control systems can lead to substantial improvements in the performance of waste water treatment plants. Other potential benefits include increased productivity, greater reliability, lower operational costs, more stable operation, and faster startups. Several tools are available for the study of dynamic behavior, including dynamic mathematical models, computer simulation, transient response analysis, and process stability evaluation. Simple examples illustrating the theory and use of these tools are presented. The development of a control strategy is intimately related to the dynamic behavior of a process. Some of the basic questions which must be answered in developing a control strategy are given. A wide variety of control algorithms are available for the processing of information for control. A discussion of several of these (on-off, PID, ratio, cascade, and feedforward) is presented, and an examples if given for the application of on-off control to a biological continuous flow stirred tank reactor. Digital computers are also being increasingly used for control of waste water treatment plants, and a discussion of computer control systems is presented. Examples of dynamic models and control strategies for the step-feed activated sludge process and the anaerobic digester are presented and discussed. In addition, dynamic modeling and computer simulations are used to indicate those design and operation factors for the anaerobic digester which are effective in improving process stability. (Witt-IPC)

TECHNICAL AND ECONOMIC ASPECTS OF WATER AND WASTE WATER OZONATION: A CRITICAL REVIEW,
Ebasco Services, Inc., New York. Nuclear Engineering Dept.
S. B. Majumdar, and O. J. Sproul.
Water Research, Vol 8, No 5, p 253-260, May 1974. 1 fig, 4 tab, 40 ref.

Descriptors: *Ozone, *Water treatment, *Wastewater treatment, *Reviews, Oxidation, Disinfection, Color, Taste, Odor, Turbidity, Suspended solids, Biochemical oxygen demand, Chemical oxygen demand, Tertiary treatment, Industrial wastes, Municipal wastes, Potable water, Toxicity, Detergents, Alkylbenzene sulfonates, Bacteria, Viruses.

Practical and economic aspects of water and waste water ozonation are discussed in comparison with other widely used treatment processes. Ozone eliminates color caused by iron, manganese, or by peaty matter, and eliminates taste and odor due to the presence of phenolic substances. Ozone also reduces the turbidity, suspended solids, BOD, and COD of waste waters and is effective in breaking down detergents and other nonbiodegradable surface active agents including alkylbenzene sulfonate. It is also a powerful disinfectant, killing not only pathogenic bacteria, but also inactivating viruses and other microorganisms not as susceptible to ordinary disinfection practices. Ozonation of water costs less than chlorination followed by dechlorination. For tertiary treatment of secondary effluents, ozonation is considerably cheaper than carbon adsorption. Residual ozone in water can be accurately determined by amperometric and photometric methods. Ozone can be easily detected before it reaches the toxic level, and it neither increases the inorganic salt content nor produces any harmful by-products during tertiary treatment. (Witt-IPC)

FLOCCULATION AND DECANTATION OF PAPER INDUSTRY WASTE WATERS FLOCULATION ET DECANTATION DES EAUX RESIDUAIRES DE PAPETERIE),
C. de Bouille.
La Papeterie, Vol 95, No 9, p 708-712, 715, Sept 1973. 7 fig, 2 tab.

Descriptors: *Waste water treatment, *Pulp wastes, *Flocculation, *Activated sludge, Aeration, Effluents, Pulp and paper industry, Treatment facilities, Waste treatment, Costs, Operation and maintenance, Equipment, Biological treatment, Operating costs, Biochemical oxygen demand, Suspended solids, Sludge treatment, Incineration, Dewatering.
Identifiers: Biomat, Sedimat, Gyro-Sedimat, Biosedimat.

The design and operating characteristics of the 'Sedimat' and 'Biomat' systems for primary and secondary treatment of paper and pulp mill effluents are described and illustrated. The 'Sedimat' is a chemical flocculator-clarifier which removes mainly suspended solids. The 'Biomat' is an activated sludge clarifier capable of removing 80-90% of the effluent's 5-day BOD. Combinations of chemical and biological treatments can be accommodated, e.g., in the 'Biosedimat' and the 'Gyro-Sedimat' system. The latter includes means for surface aeration. Cost data for these installations are included. Sludge handling (dewatering, thickening, and incineration) and reuse in paperboard production are also discussed. (Speckhard-IPC)
W74-11080

EFFLUENT POLISHING WITH A BIOLOGICAL FILTER,
Rilling Road Treatment Plant, San Antonio, Tex.
W. N. Wells.
Deeds and Data (Water Pollution Control Federation), p D1, D7-D8, June 1974. 2 fig, 1 tab.

Descriptors: *Trickling filters, *Filtration, Filters, *Waste water treatment, *Organic loading, *Biochemical oxygen demand, *Suspended solids, Activated sludge, Solids contact processes, Treatment facilities, Equipment, Silica, Porous media, Porosity, Density, Biological treatment, Capillary action.
Identifiers: Foam plastics, Filter media, Surface area.

A simple trickling filter was constructed in 1972 to determine the degree to which effluents from an activated sludge treatment plant could be further stabilized. It was made of a 10ft section of 4ft corrugated iron pipe placed vertically on spaced concrete blocks and filled with a novel filter medium comprising slabs of a porous rigid inorganic silica foam having a density of about 4lb/cu ft and a small pore size such as to impart a surface area of 30,000sq ft/cu ft with 98% voids. The capillary action of this foam was sufficient to maintain a head of 2in of water. Depending on the nature of the influent, the effluent showed BOD reductions of 58.2 to 87.3%, reductions in total suspended solids of 10.6 to 73.6%, and turbidity reductions of 23.3 to 75.6% in three 24-day trial runs at hydraulic loadings of 15 gal/min. (Brown-IPC)
W74-11081

TOTAL OXYGEN DEMAND: A NEW TOOL FOR WASTEWATER ANALYSIS,
Rilling Road Treatment Plant, San Antonio, Tex.
W. N. Wells.
Deeds and Data (Water Pollution Control Federation), p D1, D8-D9, Feb. 1974. 3 fig, 2 tab.

Descriptors: *Oxygen demand, *Biochemical oxygen demand, *Chemical oxygen demand, *Testing procedures, *Instrumentation, *Monitoring, *Waste water treatment, *Treatment facilities, Effluents, Control systems, Automation, Waste treatment, Suspended solids, Solutes.
Identifiers: *Total oxygen demand.

A total oxygen demand (TOD) analyzer is described which continuously monitors changes in oxygen concentration of a gas stream by means of a fuel cell. The operation of this instrument is outlined and illustrated. Tests indicate only a low correlation of TOD data with BOD test results. The TOD test can be valuable in the operation of waste water treatment plants and in special evaluations of substrate biodegradabilities. Being rapid and accurate, it can be used to monitor waste streams. The signal produced could be used to activate alarm systems and to start or stop treatment equipment. Oxidation pond effluents, otherwise difficult to evaluate because of the system's dynamic nature, lend themselves to TOD analyses which can, for instance, differentiate filterable material from soluble matter passing a 4.45 micrometer filter. (Brown-IPC)
W74-11083

VACUUM FILTRATION OF SLUDGE,
Corsicana Water Utilities, Tex.
W. Davis.
Deeds and Data (Water Pollution Control Federation), p D6-D7, D11, Feb. 1974. 2 illus.

Descriptors: *Filters, *Filtration, *Sludge treatment, *Dewatering, *Coagulation, *Treatment facilities, *Equipment, Vacuum drying, Operation and maintenance, Waste water treatment, Waste treatment, Chemicals, Aluminum, Iron compounds, Lime, Polymers.
Identifiers: Aluminum compounds, Coagulants, Ferric chloride, Vacuum, Vacuum filters.

The design of sludge-dewatering vacuum filters and factors affecting their efficient operation are discussed. Filtration rates of sludges can vary considerably, even between similar sludge types at different locations, owing to differences in solids concentration, particle size distribution, and chemical contaminants in industrial waste waters. Nearly all wastewater sludges require chemical preconditioning before dewatering. Most filters in current operation use ferric chloride and lime. Alum, ferric or ferrous sulfate, and aluminum chloride have also been used, and there is recent experimentation with polymeric conditioners. These chemicals act not merely as coagulants but also to loosen water surrounding and entrapped in the sludge particles. The Buchner funnel test serves both to establish feed rates and to determine the required chemical dosages. Proper operation of a vacuum filter requires auxiliary equipment, notably a discharge silencer, a vacuum receiver, an agitator, and chemical storage tanks and feeders. The filter valve and valve disk, sometimes combined, are the heart of the filter. About 25% of the drum area is submerged, and moisture is entrained from the filter cake by an air stream drawn through by the vacuum pump's pressure differential. The best speed for the conditioning tank and filter drum is the slowest one that yields a homogeneous sludge and uniform cake. Any vacuum sufficiently high to pick up and dry the cake is adequate, but a value close to 12in. (30.5 cm) of mercury is preferred. (Brown-IPC)
W74-11084

NEW SWISS SYSTEM FOR SECONDARY TREATMENT IS FIRST IN NORTH AMERICA.
Canadian Pulp and Paper Industry, Vol 27, No 3, p 30-32, March 1974. 4 illus.

Descriptors: *Water conservation, *Waste water treatment, *Pulp wastes, *Wisconsin, *Activated sludge, *Treatment facilities, Sludge treatment, Pulp and paper industry, Dissolved oxygen, Aeration, Aerated lagoons, Centrifuges, Water reuse, Impaired water use, Waste treatment, Dewatering, Suspended solids, Discharge(Water), Costs, Capital costs, Recycling, Microorganisms, Protozoa.
Identifiers: Zurn-Attisholz process, Switzerland, Wisconsin tissue mills(Menasha WI), Deinking mills(Waste paper processing), Tissue papers, Eimco clarifier, Eimco centrifuge, Eimco thickener.

The Zurn-Attisholz (Z-A) two-stage biological (activated sludge) process developed in Switzerland forms the basis for the new effluent treatment facilities installed in Menasha, Wisconsin, by Wisconsin Tissue Mills, a paper producer and reuser of deinked waste papers. Primary treatment is performed in a 450,000-gal capacity 70ft diameter Eimco reactor-clarifier which can remove over 95% of suspended solids after prescreening of coarse matter, such as grit and sand. For secondary treatment, the Z-A system employs three Fuller Suterbilt blowers of 100 hp capable of blowing 2000cu ft/min of air into two equal-sized aeration tanks of 60 x 30 x 17ft (water depth) dimensions. In the first tank, a bacterial mass of 8000ppm is mixed with mixed liquor suspended solids (MLSS) and supplied with 0.5ppm dissolved oxygen. About 200% of incoming flow is recycled from a clarifier basin to the first tank to maintain high MLSS. In the second tank, the MLSS is kept at 2000 ppm and the dissolved oxygen at 2 ppm to assure a predominantly protozoan biomass. Clarified overflow passes to a water reservoir for reuse in papermaking. Sludges are combined and concentrated in Eimco thickeners before dewatering in Eimco centrifuges. Favorable results reported for the nearly two-million-dollar combined installation include, e.g., a 10% reduction in the company's freshwater consumption (from 1.5 to 1.358 million gal/day) in December 1973. Future reductions to less than 750,000 gal/day are expected for effluent discharged to the municipal sewage system. (Witt-IPC)

ACTIVATED CARBON ADSORPTION OF PETROCHEMICALS,
West Virginia Univ., Morgantown.
D. M. Giusti, R. A. Conway, and C. T. Lawson.
Journal of the Water Pollution Control Federation, Vol 46, No 5, p 947-965, May 1974. 10 fig, 5 tab, 46 ref.

Descriptors: *Oil wastes, *Activated carbon, *Adsorption, *Waste water treatment, *Organic compounds, Industrial wastes, Wastes, Chemical wastes, Liquid wastes, Oil industry, Solids contact processes, Molecular structure.
Identifiers: *Petrochemicals, Carboxylic acids, Esters, Aldehydes, Ketones, Alcohols, Glycols.

The relative amenabilities to adsorption of 93 compounds encountered in petrochemical wastes were evaluated in single dosage tests. The results showed that the degree to which pure compounds are adsorbed by activated carbon increases as molecular weight increases and polarity, solubility, and branching decrease. Of the classes of compounds studied, the aromatics exhibited the greatest amenability to activated carbon adsorption. The relative amenabilities to carbon adsorption of straight-chain compounds of less than four carbons decreased in the order: undissociated organic acids, aldehydes, esters, ketones, alcohols, and glycols. Single-component isotherm studies with representative compounds from the five functional groupings indicated a petroleum-based

activated carbon possessing low surface acidity to be most effective. Isotherm studies with mixtures indicated that the degree of adsorption of a two-component system could be predicted with only minor downward adjustment from the single-component data. However, data from a four-component system indicated that only about 60% of the anticipated adsorption was realized, suggesting competition for adsorption sites and adverse solubility effects. Extension of isotherm data for pure compounds and mixtures to three continuous systems resulted in greater than 80% attainment of ultimate equilibrium capacities in all cases. (Witt-IPC)

PILOT PLANT STUDIES OF TURBIDITY AND RESIDUAL CELL MATERIAL REMOVAL FROM MILL EFFLUENTS BY GRANULAR MEDIA FILTRATION,
National Council of the Paper Industry for Air and Stream Improvement, Inc., New York.
R. C. Whittemore, and J. J. McKeown.
NCASI Stream Improvement Technical Bulletin, No. 266, May 1973, 33 p. 12 fig, 8 tab, 4 ref.

Descriptors: *Pulp wastes, *Waste water treatment, *Filtration, *Filters, Particle size, Treatment facilities, Suspended solids, Turbidity, Biochemical oxygen demand, Coagulation, Sludge disposal, Effluents, Pulp and paper industry.
Identifiers: Granular filters, Kraft mills, Board(Paperboard), Mills, Fine-paper mills.

Three filtration systems were tested at an integrated bleached kraft pulp and paper mill, a boxboard mill, and a fine-paper mill, respectively, as adjuncts to existing effluent treatment facilities. All three systems reduced suspended solids and turbidity by 22 to 50%, and two of the systems achieved solids removals of 90% with addition of chemical coagulants. Only small BOD removals (zero to 15%) were achieved. Although the quality of filtrates will depend on the type of waste water being treated, final effluent containing as little as 10 mg/l of suspended solids and 20 JTU turbidity appears a feasible goal. Disposal of the backwash material remains a problem to be solved. (Buchanan-IPC)

PRELIMINARY LABORATORY STUDIES OF THE DECOLORIZATION AND BACTERICIDAL PROPERTIES OF OZONE IN PULP AND PAPER MILL EFFLUENTS,
National Council of the Paper Industry for Air and Stream Improvement, Inc., New York.
R. C. Whittemore, and J. J. McKeown.
NCASI Stream Improvement Technical Bulletin, No. 269, Jan. 1974, 48 p. 19 fig, 9 tab, 60 ref.

Descriptors: *Ozone, *Color, *Coliforms, *Aquatic microorganisms, *Bactericides, *Disinfection, *Pulp wastes, *Bleaching wastes, *Waste water treatment, *Economic efficiency, Costs, Effluents, Pulp and paper industry, Chem-control, Lime, Waste treatment.

The use of ozone as a decolorant and/or disinfectant for raw and treated pulp and paper mill effluents was studied. Per milligram of ozone applied, 15-20 color units were removed from alkaline extraction (bleach plant) wastes, but less than 1 color unit from lime-pretreated effluents. Up to 90% of coliform bacteria can be removed, but large amounts of ozone are needed. Although no strict economic evaluation was made, ozone treatment did not seem to offer cost advantages over other effective effluent decoloring and disinfecting methods. (Buchanan-IPC)

Descriptors: *Bleaching wastes, *Pulp wastes, *Color, *Ion exchange, *Waste water treatment, *Incineration, Operating costs, Treatment facilities, Europe, Pulp and paper industry, Costs, Chlorides, Waste treatment, Industrial wastes, Water pollution control, Effluents.
Identifiers: Kraft mills, Recovery furnaces, Black liquor, Sweden.

At its kraft pulp and paper mill in Skoghall, Sweden, the Uddeholm Forest Industries Co. is using an ion-exchange system to remove 95% of colored organic matter from bleach plant waste waters. The separated color bodies, essentially free of chlorides, are burned in the mill's black liquor recovery furnace. Some details of the process are indicated. Economic data reveal a net operating cost of $1.44 per ton of softwood pulp (at kappa-number 35) bleached to 90-91% SCAN brightness levels. (Hansen-IPC)

USE OF THE MULTIROLL PRESS FOR DEWATERING CLARIFIER SLUDGE,
Waplans Mekaniska Verkstads A.B., Vaplan (Sweden).
J. Oledal.
Paper Trade Journal, Vol 158, No 1, p 26-28, Jan 7, 1974. 4 fig, 1 tab.

Descriptors: *Sludge treatment, *Dewatering, *Pressure, Equipment, *Treatment facilities, *Pulp wastes, Operation and maintenance, Operating costs, Costs, Comparative benefits, *Waste water treatment.
Identifiers: Waplan multiroll press, Press rolls, Dewatering presses, Newsprint mills.

Sedimented pulp and paper mill effluent sludge can be dewatered efficiently and economically with the Waplan multiroll press developed by Waplans Mekaniska Verkstads AB. in Sweden. The apparatus consists essentially of four small pressure rolls positioned around a central mother roll in such a way that the space between the latter and the smaller rolls decreases successively from 1 in. at the inlet to 0.25in. at the last press roll. The sludge is fed from a vertical chute into the space between the inlet press roll and mother roll, then forward around the latter through the three subsequent press nips, aided by doctor blades, and ultimately onto an outlet chute. Variables affecting the press performance are discussed. The throughput vs. dry solids correlation is shown for a mechanical sludge from a newsprint mill. An economic comparison between the novel multiroll press and conventional screw presses is made, favoring the former. (Witt-IPC)

WISCONSIN TISSUE EFFLUENT PLANT PIONEERS EUROPEAN PROCESS HERE.
Paper Trade Journal, Vol 158, No 10, p 32-36, March 11, 1974. 3 fig, 4 illus, 1 tab.

Descriptors: *Pulp wastes, *Treatment facilities, *Waste water treatment, *Activated sludge, *Wisconsin, Pulp and paper industry, Sludge treatment, Dewatering, Suspended solids, Biochemical oxygen demand, Centrifuges, Water reuse, Impaired water use, Water conservation, Industrial water, Waste treatment.
Identifiers: Zurn-Attisholz process, Switzerland, Wisconsin Tissue Mills(Menasha WI), Deinking mills(Waste paper processing), Waste paper, Tissue papers, Eimco clarifier.

Wisconsin Tissue Mills in Menasha, Wisconsin, manufactures paper napkins, table and tray covers, place mats, and similar lightweight paper (tissue) products with reuse of a large proportion of deinked waste paper stock. In the mill's new effluent treatment installation, which started up in Sept. 1973 after two pilot-plant runs for over a year, an Eimco reactor-clarifier achieves primary treatment, followed by a two-stage activated sludge system patterned after the Zurn-Attisholz process developed by Cellulose Attisholz AG. of Switzerland. Clarified primary effluent passes either to the secondary system or to the local municipal sewage treatment plant, or else is bypassed to a storage reservoir. Clarified overflow from the secondary system is reused in the deinking mill or in the paper mill. Sludges from both primary and secondary systems are combined and dewatered in centrifuges. Better than anticipated results are reported for the new treatment installation. Thus, in December 1973, the 5-day BOD averaged 18ppm, and suspended solids 25ppm. Of the 340,117 lb of BOD processed in the new installation, only

5558lb went to the municipal sewage plant, equivalent to 98.1% removal; and of the ,112,492lb of suspended solids processed, only 3352lb were discharged, corresponding to 99.3% emoval. (Witt-IPC)
W74-11097

POLLUTION: FILTERS FOR LOCALIZED PU-RIFICATION (POLLUTION: DES FILTRES POUR UNE EPURATION LOCALISEE).
Papier, Carton et Cellulose, Vol 22, No 7, p 40-41, uly 1973. 1 illus.

Descriptors: *Treatment facilities, *Waste water reatment, Equipment, *Water purification, Filtration, *Filters, Pulp wastes, Pulp and paper ndustry, Effluents, Water conservation, Pollution batement, Water pollution control, Water reuse. dentifiers: Immedium filter, Copefiltre, Upward-low filters.

Descriptions are given of the 'Copefiltre' and Immedium' filter which subject waters and/or vaste waters to multistage filtration in a single ass while the fluid rises upward through filter eds of decreasing granular particle size. Such up-vard-flow filters are being used in the purification f paper industry process water and of paper mill ffluents for recovery and recycling. (Speckhard-PC)

POSSIBILITIES OF USING CHEMICAL-PHYSI-CAL PURIFICATION PROCESS FOR WASTE WATERS (EINSATZMOEGLICHKEITEN CHEMISCHPHYSIKALISCHER REINIGUNG-VERFAHREN BEI RESTABWAESSERN),
. Moergeli.
Das Oesterreichische Papier, Vol 10, No 11, p 18, 0-21, Nov 1973. 4 fig, 3 ref.

Descriptors: *Filters, *Filtration, *Flocculation, Pulp wastes, *Waste water treatment, Treatment acilities, *Monitoring, *Suspended solids, Colloids, Particle size, Turbidity, Waste treat-ment, Pulp and paper industry, Adsorption, Or-anic loading, Polyelectrolytes, Effluents, Silica. dentifiers: White water(Paper machine effluent), Paper mills, Board mills.

After a general review of physical-chemical ef-luent treatment processes applicable to paper in-ustry waste waters, a detailed discussion is resented of the requirements, operating parame-ers, and practical use of solids flocculation plus iltration. The advantage of combining surface fil-ers with volume filters is pointed out. Filtration echnology in the paper industry can serve three rincipally different functions, viz., primary treat-ment for elimination of coarse and fine suspended olids; secondary removal of colloid particles; and ollution monitoring. Examples are given for filter nstallations in a fine-paper mill and in a paper-oard mill. In the first case, 50-60% of organic natter could be removed by filtration. After sub-equent passage through three adsorption columns n series, the clarified effluent contained less than ppm turbidity and less than 40mg/l of organic oading (COD, expressed as permanganate con-umption). In the second case, a chemical floccu-ator removed more than 80% of the suspended olids from board machine effluent. Subsequent iltration eliminated 60% of the remaining uspended solids without additional polyelec-rolyte and up to 95% with addition of 3ppm olyelectrolyte. Monitoring filters should be high-ate, back-washable media, such as siliceous sin-le-layer granular beds with grain sizes between .5 and 5.0mm. (Brown-IPC)

OPERATOR CERTIFICATION PROGRAMS AP-LICABLE TO INDUSTRIALLY OWNED WASTE WATER FACILITIES,
National Council of the Paper Industry for Air and Stream Improvement, Inc., New York.
J. J. McKeown.
NCASI Stream Improvement Technical Bulletin, No 272, Feb 1974. 46 p, 1 fig, 5 tab, 5 ref, 4 ap-pend.

Descriptors: *Industrial wastes, *Waste water treatment, *Treatment facilities, *Operation and maintenance, *State governments, Personnel, *Permits, Engineering personnel, Professional personnel, Scientific personnel, Training, Man-power, Education, Engineering education, Regula-tion, Administrative agencies.
Identifiers: Certification(Of operators).

An assessment of current state certification pro-grams for operators of industrial waste water treatment installations is presented. It reviews state requirements for operator certification and analyzes the procedures by which treatment plants are classed or graded for size and complexity as means of determining the required levels of skill, training, education, and prior experience. State certification programs are viewed as essential for insuring closer supervision of industrial facility performance, since their staffing differs from that of municipal waste treatment plants. (Witt-IPC)

OZONE TREATMENT OF DYE WASTE,
Clemson Univ., S.C. Dept. of Chemical Engineer-ing.
E. H. Snider, and J. J. Porter.
Journal of the Water Pollution Control Federation, Vol 46, No 5, p 886-894, May, 1974. 10 fig, 7 tab, 6 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Dyes, *Ozone, Chemical oxygen de-mand, Color, Water pollution sources, Liquid wastes, Waste water(Pollution), Wastes, Chemical wastes, Chemical degradation, Chemicals, Oxida-tion, Organic compounds, Textiles, Suspended solids, Solutes, Volatility, Hydrogen ion concen-tration.

Textile dye wastes were analyzed for COD, color, total solids, volatile solids and dissolved solids be-fore and after they were treated with ozone at three pH levels. In general, ozone reduced the COD, but the extent of reduction varied from 8 to 55%, depending on the nature of the dye waste. Ozone dramatically reduced the color of the dye wastes, but measurements were affected by high turbidity. As a treatment process, it seems that the best use of ozone in treating dye waste is as a final polishing step following conventional treatment. (Witt-IPC)

USE OF OZONE AND OXYGEN IN ADVANCED WASTE WATER TREATMENT,
W. R. Grace and Co., Baltimore, Md. Pollution Control Systems.
H. M. Rosen.
Journal of the Water Pollution Control Federation, Vol 45, No 12, p 2521-2536, Dec 1973. 13 fig, 2 tab, 17 ref.

Descriptors: *Oxygenation, *Ozone, *Oxygen, *Operating costs, *Capital costs, *Costs, *Comparative costs, *Waste water treatment, Treatment facilities, *Aeration, Equipment, Waste treatment.

The on site production of oxygen by either cryogenic means or pressure swing separation is economical for oxygen aeration systems requiring more than 40t/d (34,280kg/d) of oxygen. At this level, the generation costs are ca. $15/ton ($16.55/1000 kg). Ozonization can achieve signifi-cant reductions of COD (to less than 15mg/l) and of BOD (to near-zero) with initial ozone dosages of 0.7-3.0mg per mg/l of COD. Among several ozone generation methods available, the Lowther plate requires only 2.5-3.5kWh/16 (5.5-7.7kWh/kg) of oxygen to produce 1% ozone. Capital costs for ozone generators run from $80 to $100/lb ($176-220/kg) of daily capacity with oxygen as the feed gas. Operation with air doubles the capital and operating costs. (Witt-IPC)
W74-11103

PROTOTYPE STUDY OF MICROSTRAINING AT A PAPER MILL COMPLEX,
Camp, dresser and McKee, Boston, Mass.
A. E. Rimer.
Journal of the Water Pollution Control Federation, Vol 45, No 12, p 2567-2576, Dec 1973. 7 fig, 6 tab.

Descriptors: *Pulp wastes, *Treatment facilities, *Waste water treatment, *Pulp and paper indus-try, *Massachusetts, *Filtration, Pumps, Pump-ing, Filters, Biochemical oxygen demand, Suspended solids, Coagulation, Flocculation, Sludge treatment.
Identifiers: Microstrainers.

Strathmore Paper Co. and Esleeck Manufacturing Co., located next to each other in Turner Falls, Mass., have constructed a joint industrial waste treatment plant and operated it for more than a year. The facility comprises two microstrainers preceded by coagulation and flocculation stages. It provides equivalent secondary treatment for an average of 1.8 million gal/d (6900cu m/d) of waste waters from both mills. Some problems were en-countered with microstrainer seals, effluent pumps and associated controls, and the sludge pumps. Operating efficiencies were analyzed to show average removals of 95% of suspended solids (67,000lb or 3000kg/d) and 80% of 5-day BOD. (Witt-IPC)
W74-11104

REVERSE OSMOSIS SEPARATION OF SOME HEAVY METALLIC SALTS IN AQUEOUS SOLUTION (IN JAPANESE),
S. Ishizaka.
Journal of the National Chemical Laboratory for Industry (Tokyo Kogyo Shikensho Hokoku), Vol 68, No 11, p 437-441, Nov 1973, 2 fig, 5 tab, 8 ref. English summary.

Descriptors: *Reverse osmosis, *Membrane processes, *Waste water treatment, *Heavy metals, Zinc, Manganese, Cadmium, Copper, Nickel, Sulfates, Chlorides, Cations, Anions, Sodium chloride, Flow rates, Cellulose, Tempera-ture, Copper sulfate, Copper compounds, Water purification, Industrial wastes, Separation techniques.
Identifiers: Cellulose acetate.

The removal of Zn, Mn, Cd, Cu, and Ni sulfates and chlorides by reverse osmosis through Loeb-type cellulose acetate membranes (cured at 75C and 80C) was studied in comparison with NaCl re-jection rates. At water fluxes of 0.9-1.05cu m/sq m/d, rejection rates of 93-98.7% were obtained. More than 99.7% of heavy metal sulfates were removed by the membrane that had been cured at 80C when fluxes were below 0.8cu m/sq m/day. (Brown-IPC)

TREATMENT OF ALKALI EXTRACTION EF-FLUENTS BY ULTRAFILTRATION (TRAITEMENT DES EFFLUENTS DE SODA-TION PAR ULTRAFILTRATION),
Centre Technique de l'Industrie des Papiers, Car-tons et Celluloses, Grenoble (France).
M. Pichon, E. Muratore, and P. Monzie.
Revue A.T.I.P. (Association Technique de l'Industrie Papetiere), Vol 28, No 1, p 9-15, 1974. 5 fig, 9 tab, 7 ref.

Descriptors: *Filtration, *Waste water treatment, *Reverse osmosis, *Bleaching wastes, *Membrane processes, *Pulp wastes, Waste treat-ment, Industrial wastes, Pulp and paper industry, Organic loading, Suspended solids, Biochemical

oxygen demand, Chemical oxygen demand, Color, Flow rates, Temperature, Pressure, Costs, Operating costs, Economics, Recycling, Water reuse, Alkalinity.
Identifiers: *Ultrafiltration, Multistage processes.

Effluents from the alkaline extraction stages of two kraft pulp bleach plants were subjected to ultrafiltration in experiments designed so as to study the influence of process parameters on purification efficiencies. At low concentrations of contaminants, the reduction of pollution loads (BOD, COD, color, and dry solids content) was not significantly affected by operating temperature, pressure, and flux rates, although these variables did affect the permeability of the ultrafiltration membranes. At concentration factors up to four, ultrafiltration reduced the BOD by 46%, the COD by 76.5%, the color by 87%, and the dry solids by 56% on the average. The quality of ultrafiltrates decreased with increasing concentration. At factors above 10, some fractions of the ultrafiltrate showed pollution loads exceeding those of the influents. Since the load could be reduced by a second-stage ultrafiltration, a multistage process is recommended for industrial operation. Present operating costs are rather high, but improvements expected with further R and D work could make ultrafiltration an economically viable process for recycling of pulp and paper mill effluents. (Stapinski-IPC)

FIRST REVIEWS FAVORABLE FOR NEW ROTARY DISC BIOLOGICAL SYSTEM,
M. MacLeod.
Pulp and Paper, Vol 47, No 13, p 54-56, Dec 1973. 3 fig, 1 tab.

Descriptors: *Biodegradation, *Pulp wastes, *Treatment facilities, Equipment, Aerobic treatment, *Waste water treatment, Waste treatment, Biochemical oxygen demand, Sludge, Energy, *Biological treatment.
Identifiers: Bio-Surf process, Autotrol Corp(Milwaukee WI).

The Bio-Surf process developed by Autotrol Corp. (Milwaukee, WI) proved itself capable of competing with aerated biological treatments of pulp and paper mill effluents. Industrial trials confirmed that the process requires less energy, yields a high-solids sludge, and has good resistance to shock loadings. The basic module used is a 25ft long horizontal shaft carrying 250 corrugated polyethylene discs of 12ft diameter which rotate in a vat. A fixed aerobic biomass forms on the disc surfaces. Process variables and capital and operating costs are discussed. Pilot-plant trials are described, in which BOD removals as high as 98% are claimed. (Hansen-IPC)

A NOVEL DEVICE FOR IMPROVED AIR AND LIQUID MIXING (UJTIPUSU KESZULEK FOLYADEKOK ERINTKEZTETESERE ES KEVERESERE LEVEGOVEL),
Z. Nagy, A. Kovacz, J. Rauschenberger, and G. Hupka.
Magyar Kemikusok Lapja, Vol 18, No 11, p 560-565, 1973. 6 fig, 1 tab, 16 ref.

Descriptors: *Fermentation, Sewage, *Sewage treatment, Industrial wastes, *Aerobic treatment, *Aeration, *Waste water treatment, Oil wastes.
Identifiers: Silty sewage.

In silty sewage purification processes, industrial aerobic fermentation processes, and in purification of industrial waters containing emulsified oil or fat, it is necessary to provide an intensive contact between the air and the agitated liquids which contain large quantities of dispersed particles. According to a new process, the potential energy of the air introduced through the bottom of the vertical tubes immersed in the liquid is used for the intensive agitation of the liquid. The material transfer rate (1 to 5 kg 02/cu m hour in the sodium sulfite solution) obtainable in the equipment designed in this way depends not only on the quantity of air, but also on the velocity distribution obtained as a result of liquid agitation. MARKETS FOR CHEMICALS GROW AND GROW,
Cleveland State Univ., Ohio.
A. C. Gross.
Environmental Science and Technology, Vol 8, No 5, p 414-418, May, 1974. 1 fig, 2 tab.

Descriptors: *Costs, *Chemicals, *Wastewater treatment, *Water treatment, Costs, Coagulation, Membranes, Polyelectrolytes, Lime, Ion exchange, Resins, Filters, Forecasting, Hydrogen ion concentration.
Identifiers: Economic markets, Manufacturers.

Markets for chemicals in the antipollution field are discussed. Although inflation will raise costs of chemicals by perhaps 15% by 1980, growth of water and waste water treatment chemicals is expected to exceed the growth rate of the economy. Specific chemicals will significantly increase. Polyelectrolytes should grow more rapidly than inorganic coagulants, membranes faster than other filter media, ion exchange resins faster than lime, and oxygen should be used more widely than air. The industry is fragmented; six specialty firms control almost half of the formulations. Chemical filter materials, pH neutralizers and salts, biological action chemicals, and internal water preparations are discussed. A larger market is forecast for waste water treatment chemicals than water treatment, but both markets will increase. (Prague-FIRL)

SOME CURRENT PAPER INDUSTRY ENVIRONMENTAL PROTECTION PROBLEMS,
National Council of the Paper Industry for Air and Steam Improvement, Inc., New York.
I. Gellman.
Paper Trade Journal, Vol 158, No 13, p 28-30, April 1, 1974.

Descriptors: *Energy, *Management, *Pulp wastes, *Waste water, *Bark, Effluents, Technology, Sulphite, Chemicals, Costs, Pulp and paper industry, Lime, Precipitation, Reviews.
Identifiers: Zero pollution discharge, Color detectability, Pulping liquors.

Reviewed are problems relating to three aspects of energy and management. These are: the recovery of energy from materials such as bark and spent pulping liquors which were once considered wastes; the efficient use of energy in managing waste water, atmospheric emissions, and solid wastes; and the harnessing of natural energy for the dispersal of effluents and emissions. Trends towards incineration of various semi-chemical and acid spent sulphite liquors have been due to both technology and the comparison of heat and chemical recovery costs within the paper industry. Aspects discussed include current kraft process studies, spent sulphite liquor studies, bark burnings, innovative industry approaches, high energy use by precipitators, lime kiln and sludge problems, sludge handling, and organic load and decolorization. In addition, zero pollution discharge, color detectability in surface waters, and the need for year round treatment are mentioned. Study of reliability of regional dispersion models, degree of further refinement, and control of operations is recommended. (Prague-FIRL)

FEASIBILITY OF WATER REUSE AT HIGHWAY REST STATIONS,
Virginia Highway Research Council, Charlottesville.
C. E. Parker.
Journal of the American Water Works Association, Vol 66, No 4, p 247-249, April, 1974. 4 tab, 9 ref.

Descriptors: *Water reuse, Effluents, *Costs, *Waste water treatment, Water quality, Phosphorus, Organic carbon, Aeration, *Recycling.
Identifiers: *Flush toilets, *Highway rest areas.

A study was made of the current effluent quality from an existing rest station, the treatment required to upgrade the waste water from the rest area for recycle, the requirements of the rest area, and the response necessary for a recycle system to meet peak demands. Water use was correlated with rest area use and traffic flow. Waste water was examined from an area employing an extended aeration system and a holding pond, and evaluated regarding requirements for toilet flushing at peak needs. It appears that by changing the flow scheme and storage and disinfection scheme, the present effluent could be used for flushing toilets. Capital costs were compared with the necessary system for effluents which are free from phosphorus and low in organic carbon. This recycling alternative would save about $35,000 per rest area. On a test basis, it is indicated that waste water reuse for flushing toilets at highway rest areas offers an alternative to releasing high-quality effluent to a stream. Further demonstration projects are needed. (Prague-FIRL)

THE DIRECT REUSE OF RECLAIMED WASTEWATER: PROS, CONS, AND ALTERNATIVES,
Carollo (John) Engineers, Walnut Creek, Calif.
W. J. Phillips, II.
Journal of the American Water Works Association, Vol 66, No 4, p 231-237, April 1974. 9 tab, 21 ref, 1 photo.

Descriptors: *Water reuse, *Reclaimed water, *Waste water treatment, Impaired water use, Sewage treatment.

With the supply of water decreasing and need increasing, there is growing interest in reuse of wastewater to supplement water supplies. Despite the apparent success of several existing reclamation projects there is evidence that the use of reclaimed wastewater in domestic water supplies may not be as safe as it should be. A comparison of arguments and research data by both proponents and skeptics of water recycling is presented. While several studies indicate that some existing treatment processes are capable of producing a high quality effluent, the effectiveness of present operating processes diverges widely. Developing reliable systems and adequate monitoring techniques are two major problems. The immediate implementation of recycling is not necessary. Further study is needed to determine effluent quality standards required for safe recycling. Alternative approaches to water and wastewater management, such as water salvage and conservation measures, should be developed to allow time for further investigation into all aspects of wastewater reuse. (Deckert-Florida)

escriptors: *DDT, *Filters, Coagulation, Sand.
entifiers: BHC, Lindane, Hexachlorocycldhexe.

rification of water contaminated with hexhlorocyclohexane and DDT at up to 10 times the aximum allowable dose was analyzed with agulants, flocculants and active filtering agents. e use of Al2(SO4)3 or Fe2(SO4)3, even in high ncentrations was not successful. Increasing the I by adding Na2CO3 or additional filtering rough sand substantially improved the results of agulation techniques. The effect of polyacrylade depended on the dose of the reagent. Comed use of Al2(SO4)3, polyacrylamide and filterg through sand provided high degrees of purity. alysis of current 'barrier functions' of water puication plants using Al2(SO4)3, settling, filtering rough sand and chlorination showed limited sults. Out of filtering materials tested, ionites re more effective than active C. Ion-exchange lymers were fairly effective; silica sand was infective.--Copyright 1974, Biological Abstracts, c.

entifiers: Polyurethane filters.

lter media were tested for use in a continuous nerating moving bed process for clarifying oily llast waters. Media investigated includes materials ranging from glass, porous ceramics, metals, wools, plastics, activated carbon, anthracite, in the form of discrete beads or irregular granules, fibrous non-woven mattings and reticulated (open-pore) foams. A partially compacted bed of randomly oriented pieces of an open structured polyurethane foam does an excellent job of scavenging a wide variety of oil contaminants, including both crude and Bunker 'C' types. The resilient nature of this material facilitates reuse by pressing spent media. (Knapp-USGS)

FLOCCULATION OF AQUEOUS QUARTZ SUSPENSIONS WITH NEUTRAL AND CATIONIC POLYMERS IN THE PRESENCE OF CO(II), CA(II), OR FE(III),
Natal Univ. Pietermaritzburg (South Africa). Dept. of Science.
E. A. Appleton.
Available from NTIS, Springfield, Va 22161 as PB-222 026, Price $9.50 printed copy; $2.25 microfiche. South Africa Council for Scientific and Industrial Research Pretoria, Chemical Engineering Research Group, Special Report CENG 004, March 1973. 159 p, 40 fig, 5 plate, 21 tab.

Descriptors: *Flocculation, *Suspension, *Water treatment, Suspended load, Hydrogen ion concentration, Separation techniques, Cations, Zeta potential, Polymers, Adsorption, *Waste water treatment.

Flocculation of quartz suspensions by polymers was studied over the pH range 2 to 11. When quartz suspensions contain only monovalent alkali metal cations in solution, the neutral polyacrylamide polymer adsorbs onto the particles via hydrogen bonds to isolated undissociated surface silanols. Flocculation is caused by polymer bridging and is dependent on adsorption which decreases with increasing pH. Adsorbed polyacrylamide has no effect on the negative zeta potential of the particles. Polyvalent metal cations such as Co(II), Ca(II), or Fe(III) adsorb on quartz particles by ion exchange with protons from surface silanols. This chemisorption changes the negative zeta potentials to more positive values having maxima which are characteristics of the cation species and their equilibrium concentrations. When quartz particles have positive surface sites due to the chemisorbed Co(II), Ca(II) or Fe(III) ions the suspensions are flocculated more effectively by polyacrylamide, at any pH value, than in the absense of these cations. In addition, the zeta potential of the flocculated particles is much less negative. The cationic quaternary ammonium polymer is adsorbed on quartz due to electrostatic attraction and the zeta potential of the particles becomes less negative. The more negative zeta potential of the particles at high pH increases the electrostatic attraction and results in better flocculation. When Co(II) or Ca(II) ions are added to quartz suspensions the cationic polymer causes flocculation provided there are still surface sites available for the ionic bonding of this polymer. However, Fe(III) ions (at low pH values) prevent flocculation by this polymer. (Knapp-USGS)

A BEEF CONFINEMENT BUILDING WITH AN OXIDATION DITCH,
Illinois Univ., Urbana. Agricultural Experiment Station.
D. B. Bauling, W. D. Boston, and D. L. Day.
Presented at 1973 Winter Meeting, American Society of Agricultural Engineers, Chicago, Illinois, December 11-14, 1973. 12 p, 10 fig.

Descriptors: *Confinement pens, *Oxidation lagoons, *Cattle, *Farm wastes, *Waste storage, Design, Foaming, Ammonia, Odor, Aeration, Lagoons, Aerated lagoons, Farm lagoons, Recycling, *Waste water treatment.
Identifiers: *Recirculating system, Slotted-floor pens, Aerobic lagoons.

A new cold-confinement unit for beef cattle was placed in operation on November 30, 1972 at the Beef Research Farm on the Urbana-Champaign Campus of the University of Illinois. The unit was designed to receive the animal waste, aerate it for odor control and decomposition, concentrate it for storage, and finally eliminate it from the system. The unit features a totally slotted floor, an oxidation ditch, a mechanically aerated settling lagoon, and an aerobic holding lagoon. All of these are tied together in a continuous recycling system designed to dispose of all the waste without the need to clean the oxidation ditch. The experiment has shown that removal or replacement of cattle, changes in animal diets, variations in dilution or aeration rates, and changes in temperature can all adversely affect the operation of the system. Design considerations, operational problems, and general observations are given. (Cartmell-East Central)

SOIL COLUMNS FOR SIMULATING ANIMAL MANURE RECYCLING,
McGill Univ., Montreal (Quebec). Dept. of Agricultural Engineering.
J. R. Ogilvie, and B. P. Warkentin.
Presented.at 66th Annual Meeting, American Society of Agricultural Engineers, University of Kentucky, Lexington, June 17-20, 1973, Paper No. 73-429, 13 p, 4 fig, 2 tab, 7 ref.

Descriptors: *Farm wastes, *Recycling, *Soils, *Waste disposal, Denitrification, Degradation(Decomposition), Chemical properties, Physical properties, Biological properties, Microorganisms, Drainage, Water, Ions, Chromatography, Chemical oxygen demand, Slurries.
Identifiers: *Soil columns, *Animal manure, Loading rates, Detention time, Flux, Carbonaceous slurry.

Soil columns were used in two studies considering applications of carbonaceous slurry material for soil recycling. The soil columns were found to be useful guides to the effect of manure recycling on soils. Since microbial denitrification and degradation of the applied manure was desired, the study of detention time was of major importance, as was maximum loading of manure slurry. The study of the flux of different solutions through the soil was instrumental in deriving response curves for these experiments. (Frantz-East Central)

REDUCING LABOR DURING BROILER GROWOUT,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Agricultural Extension Service.
W. D. Weaver, Jr.
Poultry Digest, Vol 32, No 382, p 538-540, December, 1973. 6 fig.

Descriptors: *Automation, *Litter, *Farm wastes, *Labor, Cleaning, *Virginia, *Poultry, Farm wastes, Waste treatment.
Identifiers: *Broiler growout, Spreading, Feeder lids, Water jugs.

In Virginia, observations were made on tasks such as getting new litter in and old litter out of the poultry house and on filling and cleaning feeder lids and water jugs. New litter is normally delivered to the house in trucks that can be automatically unloaded. Chain-bottomed trucks can spread the litter in a windrow through the center of the house. From experiments, it has been found that just as good a start can be obtained without

water jugs, providing that at least four eight-foot, shallow, 'V' water troughs are supplied per 1,000 birds. Filling feeder lids is still done by wheelbarrow and coal bucket. One grower in central Virginia used a motorcycle-powered cart. Because of the increasing cost of new litter material, most companies today are practicing a built-up litter program. Under this program, houses are cleaned out once a year. Clear span houses lend themselves best to automated cleanout, although houses with posts can be adapted to most automation. Remodeling can save labor when properly done. (Drewry-East Central)
W74-11243

MORE BEEF ON THE HOOF GOAL OF OHIO RESEARCH.
Feedlot Management, Vol 15, No 11, p 22-24, November, 1973.

Descriptors: *Ohio, Research, *Cattle, *Productivity, *Farm wastes, Recycling, Protein, Feeds, Optimization, Breeding, Waste treatment.
Identifiers: Beef, Crossbreeding, Ralgro, Selenium, Shipping fever, Diethylstilbestrol.

Research on crossbreeding, wastes, protein, Ralgro, selenium and shipping fever has been conducted by animal sceintists at the Ohio Agricultural Research and Development Center. The goal was to produce animals that manufacture quality beef as quickly and efficiently as possible. A crossbreeding project was established in 1970 to help identify the importance of breeding alternatives. The mating scheme was designed to produce straightbred Angus and Charolais cow herds. Results showed Angus calves were smaller at birth, but had a higher rate of survival and higher conformation scores at weaning. They produced more pounds of calf per unit of metabolic size than any other crosses. Feeding animal wastes has potential in starter rations for fat cattle or in rations for brood cows or ewes. Feeding trials, including protein withdrawal, have proved animals to require supplemental protein until calves weigh between 760-790 lbs. Then supplement protein can be discontinued. Three trials involving 100 heifers and 300 steers showed the performance of DES-treated cattle. Blood analyses indicated the selenium content of whole blood was increased 56 days following selenium injection. Research is still being done on selenium injections. Smith and Preston revealed a theory that protein might be a factor in shipping fever; however, results of the study were inconclusive. (Drewry-East Central)

POULTRY ANAPHAGE IS HERE TO STAY,
Michigan State Univ., East Lansing. Coll. of Agriculture and Natural Resources.
H. C. Zindel.
Egg Industry, Vol 6, No 7, p 22 July 1973. 2 fig, 5 ref.

Descriptors: Poultry, *Farm wastes, *Feeds, *Recycling, Productivity, Fertility, Calcium, Phosphorus, *Waste treatment, Waste disposal, Dehydration.
Identifiers: *Dried poultry wastes, Hatchability, *Poultry anaphage.

On the basis of research, feed costs, and feed ingredient availability, dried poultry and livestock feed. A 12.5 to 25 percent dried poultry waste diet replacement in poultry feeding over a 14 month period caused no change in production, fertility, or hatchability, and no discernible difference was revealed by necropsy. Potential poultry waste sales outlets are livestock and poultry feeds, mushroom culture media, and organic fertilizers. Since phosphorus and calcium were found to increase in recycling, feeding of dried poultry waste as a diet replacement should not exceed 25 percent. Keys to successful poultry waste dehydration are: (1) operation economy and ease, (2) packaging unity, (3) low service and maintenance costs, (4) emission control, (5) consistent and uniform production, (6) efficient continuous operation, and (7) compliance with EPA odor, smoke, and particulate standards. (Hargrove-East Central)

PURIFICATION PLANT EUTIN, APPLICATION OF SIMULTANEOUS PRECIPITATION FOR PHOSPHATE ELIMINATION, (KLAERANLAGE EUTIN, ANDWENDUNG DER SIMULTAN-FAELLUNG ZUR PHOSPHATELIMINIERUNG,),
K. Mudrack, and G. Stobbe.
Wasser Luft und Betrieb, Vol 18, No 5/6, p 289-292, 1974. 4 fig, 2 tab, 2 ref.

Descriptors: *Phosphates, *Precipitation, *Iron compounds, Sludge treatment, Biochemical oxygen demand, *Waste water treatment.
Identifiers: *Iron sulphate, *Germany(Eutin).

In the city of Eutin, Germany, treating the sewerage of a population of over 17,800, waste water from a military caserne, a police training camp, and the usual small trade, the possibilities of phosphate-elimination and of influencing the sludge index by addition of iron sulfate into the activation basin were studied. This was done both in the laboratory and in practical operation of the city's mechanical-biological treatment plant. Amounts of 16g Fe/cu m and 46g/cu m were added. Phosphate elimination rates of about 80 to 90 percent were achieved, leaving a residual concentration of 2 to 5mg/liter of phosphate. The sedimenting properties of the sludge were improved and the volume of surplus sludge was reduced. The purification efficiency of the plant, as measured by BOD and KMn04 consumption, was improved. (Shaffer-FIRL)
W74-11247

THE EFFECT OF SURPLUS ACTIVATED SLUDGE IN FILTER PRESS PERFORMANCE,
Mansfield Sewage Works (England).
C. E. Brade, and N. E. W. Sambidge.
Water Pollution Control, Vol 73, No 2, p 138-149, 1974. 10 fig, 7 tab, 6 ref.

Descriptors: *Sludge treatment, *Dewatering, *Activated sludge, Treatment facilities, Digestion, Filters, *Waste water treatment.
Identifiers: Elutriation, United Kingdom(Mansfield-Eng).

Experiments to press raw primary and humus sludge, raw mixed sludge which contains surplus activated, digested mixed sludge, and elutriated digested mixed sludge are recounted. Test results led to the following conclusions: raw primary/humus sludge was readily dewatered using batch conditioning techniques; the poor cakes were due to aging after addition of the conditioner; raw mixed sludge could be pressed more satisfactorily using an in-line conditioning system when proportions of activated sludge were not high; and, the mixed sludge, after digestion and elutriation, was easily pressed in a short time and gave excellent cakes. (Sandoski-FIRL)
W74-11248

INVERSE SEPARATION OF HEAT-TREATED SLUDGE,
University Coll. of South Wales and Monmouthshire, Cardiff. Dept. of Mechanical Engineering.
C. Rotsides, and J. G. Everett.
Water Pollution Control, Vol 73, No 2, p 210-213, 1974. 6 fig, 7 ref.

Descriptors: *Sludge treatment, *Heat treatment, Air entrainment, Settling, Laboratory tests, *Waste water treatment.
Identifiers: *Floating sludge.

An examination of the problem of floating sludge was undertaken with experiments showing that agitation and air entrainment of heat-treated sludge may play a part in causing sludge to float. It was found that the amount of floating sludge is not influenced by either temperature or period of heat treatment but that solids concentration does have a pronounced effect on the settling of the sludge. Continuous operation of the decanter also may influence sludge floating. (Sandoski-FIRL)
W74-11249

THE EFFECT OF HEAT TREATMENT ON THE SOLUBILIZATION OF HEAVY METALS, SOLIDS AND ORGANIC MATTER FROM DIGESTED SLUDGE,
University Coll. of South Wales and Monmouthshire, Cardiff. Dept. of Mechanical Engineering.
J. G. Everett.
Water Pollution Control, Vol 73, No 2, p 207-209, 1974. 4 tab, 9 ref.

Descriptors: *Heat treatment, *Sludge treatment, *Heavy metals, *Solubility, Nitrogen, Fertilizers, Organic matter, Zinc, Copper, Nickel, Chromium, Lead, Sludge digestion, Solid wastes, *Waste water treatment.

The effect of heat treatment on the solubility of five metals and other digested sludge components has been investigated. Nitrogen was found to be more soluble than most sludge components and metals were found to be the least soluble. This has important implications for the use of the liquor as an agricultural fertilizer. The liquor solids averaged 12 percent of the toxicity of the sludge. For equal applications of nitrogen the liquor was only six percent as toxic as the sludge. (Sandoski-FIRL)
W74-11250

A STUDY OF CONDITIONING SEWAGE SLUDGES WITH LIME,
L. J. Webb.
Water Pollution Control, Vol 73, No 2, p 192-206, 1974. 7 fig, 7 tab, 12 ref.

Descriptors: *Sludge treatment, *Sewage sludge, *Lime, Efficiencies, Investigations, Liquids, Solids, *Waste water treatment.
Identifiers: *Lime conditioning, *Copperas.

The following two project objectives were investigated with respect to lime treatment of sewage sludges: to understand further the mechanism of lime conditioning of sewage sludges with a view to improvements in process efficiency and to compare various lime conditioning systems on a variety of sludge types. Lime with copperas was the most effective conditioning system on typical examples of primary, digested, and activated sludges. There is a much larger variation in the liquid phase lime demand than in the solid phase demand. The great efficiency of lime in conditioning primary sludges is attributed to its interaction with the fat/grease content of the sludge. (Sandoski-FIRL)
W74-11251

FACILITIES FOR CONTROLLING THE ACTIVATED SLUDGE PROCESS BY MEAN CELL RESIDENCE TIME,
Yoder-Trotter-Orlob and Associates, Walnut Creek, Calif.
M. E. Burchett, and G. Tchobanoglous.
Journal Water Pollution Control Federation, Vol 46, No 5, p 973-979, May 1974. 7 fig, 6 ref.

Descriptors: *Activated sludge, *Treatment facilities, *Control systems, Automatic control, Operation and maintenance, *Waste water treatment.
Identifiers: *Mean cell residence time.

Several methods now being used by operators to control the activated sludge process are discussed. The use of the mean cell residence time (MCRT) is recommended as the most suitable operational control parameter. The basic concepts involving the theoretical and practical reasons for controlling the MCRT are discussed. The physical features of a control system developed to use this method are presented. The following advantages for the proposed control system are: minimum required operator attention, inexpensive capital costs, more positive process control, and more stable process operation. (Sandoski-FIRL)

AEROBIC TREATMENT OF FEEDLOT RUNOFF,
Nebraska Univ., Lincoln. Dept. of Civil Engineering.
Terence J. McGhee, R. L. Torrens, and R. J. Smaus.
Journal Water Pollution Control Federation, Vol 45, No 9, p 1865-1873, Sept, 1973. 4 fig, 7 tab, 14 ref.

Descriptors: *Feed lots, *Agricultural runoff, *Aerobic treatment, *Waste water treatment, Cattle, Farm wastes, Physical properties, Chemical properties, Chemical oxygen demand, Biochemical oxygen demand, Liquid wastes, Sludge.

The feedlot runoff used in this study was obtained from the University of Nebraska. The units were operated at liquid retention times of 1-8 days. The study was conducted at room temperature. It was determined that an aerobic biological system can effectively treat settled feedlot runoff. Reductions of chemical oxygen demand of sixty percent may be obtained. Liquid retention times of three days or more are sufficient to insure satisfactory treatment. The color of the runoff is affected slightly by aerobic treatment. Analysis of chemical oxygen demand is superior to the 5-day biochemical oxygen demand determination in evaluating the efficiency of treatment and the strength of feedlot runoff. CHARACTERISTICS OF ZINC SMELTING INDUSTRIAL WASTE AND SIMULTANEOUS REMOVAL OF TOXIC ELEMENTS AND PHOSPHATES FROM IT,
Indian Defence Lab., Jodhpur.
L. M. Bhandari.
Indian Journal of Environmental Health, Vol 15, No 3, p 236-242, July, 1973. 4 tab, 5 ref.

Descriptors: *Zinc, *Industrial wastes, *Iron, *Effluents, *Waste water treatment, Toxicity, Mills, Hydrogen ion concentration, Chemical precipitation, Toxicity, Phosphates.
Identifiers: *India.

The chemical characteristics of the effluents from zinc smelter at Debari, Rajasthan, India are reported. The effluent was not only toxic due to the presence of metallic and flouride ions, but a high concentration of phosphates also rendered it unsuitable for disposal to the river water. Zinc and iron seem to be the major metallic ions in the waste; their concentrations varied between 120-160 and 35-48 mg/l, respectively. An attempt was made to remove zinc, iron, and phosphates by treating the effluent with sodium hydroxide or lime. The effect of increasing the pH of the effluent on percent removal of zinc and phosphates was studied. Lime seemed to be the most suitable precipitating agent for this effluent. (Jernigan-Vanderbilt)

HEAVY METAL REMOVAL FROM WASTEWATER TREATMENT PLANT BY CHEMICAL TREATMENT,
C. M. West, W. P. Bonner, and R. B. Bustamante.
28th Annual Purdue Industrial Waste Conference, May 1-3, 1973, Lafayette, Indiana. 33 p, 10 tab, 18 ref.

Descriptors: *Heavy metals, *Wastewater treatment, *Treatment facilities, *Trace metals, Effluents, Tertiary treatment, On-site investigations, Toxicity, Chromium, Nickel, Cadmium, Copper, Lead, Mercury, Sampling, Testing procedures, Analytical techniques, Spectroscopy.

The sewage treatment plant in Cookeville, Tennessee was studied to determine the general quality of the effluent of the plant, with respect to heavy metals, and to determine the effect of the proposed tertiary treatment system on the quality of the effluent with respect to heavy metals. Six heavy metals were chosen for investigations, based on their toxicity and probability of occurrence in these effluents. The metals were chromium, nickel, cadmium, copper, lead, and mercury. Grab samples were taken from the sewage treatment plant effluent in August, 1971, when the flow was approximately 2.0 to 2.5 million gallons per day. Several of these samples showed small amounts of chromium and copper. An occasional sample indicated the presence of cadmium. None of the other heavy metals were detected. Tests were made on a fresh effluent sample taken in April, 1972 to determine: (1) treatment of the effluent with aluminum sulfates; (2) treatment of spiked effluent samples with alum; (3) treatment of spiked effluent samples with pH adjustment and alum; (4) the use of ferrous sulfate as a flocculant; and (5) the use of ferric chloride as a flocculating agent. It was concluded that the quality of the effluent, with respect to solids, could be improved by adjustment of pH and treatment with any one of the coagulants listed above. (Jernigan-Vanderbilt)

SOME EFFECTS OF METALS DISCHARGED IN EFFLUENTS AND POSSIBILITIES FOR THEIR RECOVERY,
Water Pollution Research Lab., Stevenage (England).
J. D. Swanwick, and J. V. O'Gorman.
Chemistry and Industry, p 573-575, June 16, 1973. 29 ref.

Descriptors: Effluents, *Sludge treatment, *Industrial wastes, *Wastewater treatment, Solvent extraction, Metallurgy, Separation techniques, Recycling, Public health, Ion exchange, Reverse osmosis.
Identifiers: Hydrometallurgical processes.

Removal of metals in sewage treatment leads to greatly increased concentrations in sludge. Agriculturalists have found that nickel, copper and zinc have the greatest adverse effects on crop growth. Increased uptake of metals by plants from soil treated with sewage sludge can also affect the health of humans. For these and economic reasons, it is wise to remove metals from sewage sludges, ideally to recover them. The most logical place for recovery is in the industry prior to discharge to the sewer. Thermal or hydrometallurgical processes may be used with the latter preferred for flexibility, rate of recovery, freedom from pollution, and low capital cost. Recovery from sludge may be accomplished by dissolving the waste in acid and applying an appropriate process such as solvent extraction (Cu, Ni, Co, B, etc), ion exchange (Cr, Cu, Zn, Cd, Hg) reverse osmosis (Ni), electrochemical methods, adsorption on activated carbon, or complex formation with polyelectrolytes. (Jernigan-Vanderbilt)
W74-11366

POLLUTION ABATEMENT IN A COPPER WIRE MILL.
Industrial Water Engineering, Vol 11, No 6, p 6, March/April, 1974. 1 tab.

Descriptors: *Copper, *Pollution abatement, *Industrial wastes, Effluents, Water pollution, Chemical precipitation, Metals, *Water reuse, *Recycling, *Waste water treatment, *Electrolysis.

The production of copper wire has always presented numerous pollution problems. The wire had to be 'pickled' and then coated and 'repickled' and rinsed. All of these techniques produced additional pollutants and the costs of treatment were excessive. In an EPA demonstration grant, the Volco Brass and Copper Company demonstrated that water consumption could be reduced by 90% from 200,000gal/d to 20,000gal/d by chemical reuse and water reuse. The sulfuric acid picke was regenerated and high purity metallic copper recovered by continuous electrolysis, thereby eliminating the dumping of spent pickel liquor. Hydrogen peroxide was proven to be an improved secondary pickle and the chromates and fluorides previously used were eliminated. Total solids leaving the plant in the rinse water were reduced from 2500gal/d to less than 100gal/d. Metal losses in the effluent were reduced to less than one pound per day compared to the previous 600-700lb/d. (Jernigan-Vanderbilt)
W74-11383

METHOD AND APPARATUS FOR SEPARATION OF SLUDGE,
FMC Corp., Santa Clara, Calif. (assignee).
F. F. Sako, and S. S. Chandler.
U.S. Patent No 3,833,204, 4 p, 2 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 924, No 1, p 107, July 2, 1974.

Descriptors: *Patents, Liquid wastes, *Sewage treatment, *Activated sludge, *Aeration, Pollution abatement, *Wastewater treatment, Water pollution control, Water quality control, Electrodes, Separation techniques.

Liquid waste entering the activated sludge plant, after screening, comminuting, degritting and primary clarification, flows into an aeration basin. The mixed liquor discharged from the aeration zone is fed into a chamber for separation and densification of sewage sludge. This chamber is provided with electrodes. A difference of potential is imposed across the respective electrodes and current is passed in quantities to decompose water and produce fine bubbles of hydrogen and oxygen which rise in a dispersed form through the aqueous medium. As the sludge material is contacted by and has bubbles of gas adhered or occluded to it, a definite profile or lower limit of sludge blanket materializes. Effluent of acceptable quality can be discharged from any level intermediate the bottom of the sludge blanket being maintained by the rising bubbles and the electrodes. (Sinha-OEIS)
W74-11397

BIOTREATMENT PROCESS,
Sterling Drug, Inc., New York. (assignee).
A. H. Erickson, E. M. Pogainis, and G. H. Teletzke.
U.S. Patent No 3,824,186, 3 p, 1 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 924, No 3, p 631, July 16, 1974.

Descriptors: *Patents, *Wastewater treatment, *Aeration, *Biochemical oxygen demand, *Biological treatment, *Sewage treatment, Pollution abatement, Water pollution control, Water quality control, Dewatering, Organic wastes.

The method is achieved by feeding liquors to an aeration vessel containing a previously acclimated biological sludge, the loading rate of the liquors to the aeration vessel being between 1.0 and 5.0kg of biological oxygen demand per kg of mixed liquor volatile suspended solids. Then the mixture in the vessel is agitated for a period in excess of two hours with an oxygen containing gas while a dissolved oxygen content is maintained sufficient to support aerobic biological growth. The next step is to pass the mixture to a settling tank to separate accumulated biological sludge; recycle the settled biological sludge to the aeration tank; and remove from the aeration tank biological sludge at a rate approximately equivalent to the rate of accumulation of the biological sludge. (Sinha-OEIS)
W74-11398

AMMONIA ELIMINATION SYSTEM,
Environmental Protection Agency, Washington, D.C. (assignee).
D. H. Caldwell, and E. F. Barth.
U.S. Patent No 3,824,185, 4 p, 1 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 924, No 3, p 631, July 16, 1974.

Descriptors: *Patents, *Wastewater treatment, Water pollution control, Water quality control, Nitrogen, Ammonia, *Nitrification, *Denitrification, *Biological treatment, Nitrobacter sp, Nitromonas sp.

Air stripping is combined with biological nitrification and denitrification. The procedure involves air stripping the main flow waste water stream. However, rather than discharge the ammonia laden air to the atmosphere, the air thereafter passes through an ammonia absorber where the ammonia content is absorbed into an aqueous side stream. The ammonia absorber constitutes also a biologic reactor in which nitrifying organisms, Nitrobacter species and Nitromonas species, present on adsorber surfaces and in the absorber water convert ammonia to nitrate and nitrite. The process serves to transfer the dilute ammonia nitrogen originally present in the waste water into a concentrated nitrate/nitrite absorber product stream, then to convert the nitrate/nitrite to nitrogen gas which can be safely discharged to the atmosphere. (Sinha-OEIS)
W74-11399

DEVICE AND APPARATUS FOR TREATING LIQUIDS SUCH AS DRINKING WATER AND WASTE WATER,
Societe Industrielle du Traitement des Liquides et des Gaz, La Courneuve (France).
P. Chapsal.
U.S. Patent No. 3,823,923, 4 p, 4 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 924, No 3, p 569, July 16, 1974.

Descriptors: *Patents, *Waste water treatment, *Ozone, Pollution abatement, Water quality control, Bubbles, Potable water, Equipment, Water treatment.

The device comprises a tube which is immersed in liquid in a tank and communicates at its upper end with treating gas-supply means. A diffuser having radial vanes fixed to a rotating disc communicates with the lower end of the tube. A pump which is under and coaxial with the diffuser pumps the liquid from the tank through passages in the disc into chambers defined by the vanes so as to form in the chambers an emulsion of the gas and liquid which is thereafter ejected into the liquid in the tank. (Sinha-OEIS)
W74-11403

WATER TREATMENT FILTER BED FOR SEWAGE SYSTEMS,
J. L. Bergles, and M. A. Nelson.
U.S. Patent No 3,823,825, 3 p, 2 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 924, No 3, p 543, July 16, 1974.

Descriptors: *Patents, *Water treatment, *Filtration, *Sewage treatment, *Waste water treatment, Pollution abatement, Water pollution control, Water quality control, Tile drains, Treatment facilities, Equipment.

The trickle type water treatment filter bed has an absorption bed formed in the ground in which gravel is placed. A drain tile extends throughout the bed for conducting water from the sewage treatment plant and throughout the length of the bed. A drain wall is located in the ground and spaced a short distance from the absorption bed. The drain wall is formed at a depth lower than the depth of the absorption bed. It prevents surface and ground water from running into the absorption bed and thereby overloading the latter. It also functions to drain excessive sewer water from the absorption bed itself. (Sihna-OEIS)
W74-11405

PROCESS FOR TREATING WATER,
Economic Development Corp., Battleboro, Vt.
M. E. McLaughlin.
U.S. Patent No 3,823, 767, 10 p, 4 fig, 2 tab, 3 ref; Official Gazette of the United States Patent Office, Vol 924, No 3, p 529, July 16, 1974.

Descriptors: *Patents, *Waste water treatment, *Dissolved oxygen, *Cooling water, *Thermal pollution, *Aeration, Pollution abatement, *Sewage treatment, Water pollution control, Reservoirs, Oxygenation, Powerplants.

The process includes storing water in a reservoir at a selected height above the level of the body of water, periodically releasing specified quantities of water from the reservoir at a point below the level and in an upward direction toward the surface and into the body of water. The upward direction of the released water is accomplished by releasing the water against a deflector located near the base of the reservoir. The released water forms a translatory wave in the body of water and as it moves away from the reservoir, it breaks causing effective mixing of air and water, cooling the water and increasing the oxygen content of the water. This action accomplishes excellent mixing of air and water and where solid particles are present, breaking and pulverizing of the particles. The invention pertains to cooling water effluent from power generating stations to prevent thermal pollution of natural bodies of water. In another embodiment it pertains to a more efficient method of aerating and treating sewage. (Sinha-OEIS)
W74-11406

POLLUTED WATER PURIFICATION,
Phillips Petroleum Co., Bartlesville, Okla.
E. O. Box, Jr., and J. Farha, Jr.
U.S. Patent No 3,823,088, 5 p, 6 tab, 5 ref; Official Gazette of the United States Patent Office, Vol 924, No 2, p 342, July 9, 1974.

Descriptors: *Patents, *Water purification, *Catalysts, *Oxidation, Water pollution treatment, Pollution abatement, *Waste water treatment, Metals, Organic wastes.
Identifiers: Zinc aluminates.

Organically polluted waters are purified by contacting with a catalyst such as zinc aluminate and promoted with at least one metal active for initiating oxidative reactions in the liquid or gaseous phase under oxidizing conditions. Zinc aluminate can be prepared using any conventional method of preparation which will provide a solid material having a surface area of at least about one square meter per gram. One particularly suitable method is to intimately blend a mixture of aluminum oxide and zinc oxide, in essentially stoichiometric proportions, followed by a calcination step wherein the mixture is heated in air at temperatures of 1500-2200 deg F. Prior to the calcination, the mixture can be formed into conventional catalyst shapes such as pellets, extrudates, agglomerates, and the like. Some or all of the zinc aluminate can be in the spinel form. The process is particularly applicable for feeds in which the organic materials are hydrocarbons and/or oxygenated hydrocarbons. In vapor phase operation, the temperatures can be 600-1200 deg F., preferably 900-1000 deg F., and at any convenient pressure which will permit operation in the vapor phase. In liquid phase operation, the temperature within the reaction zone will generally be 350-550 deg F., preferably 400-500 deg F., and under a sufficient pressure to maintain a liquid phase within the reaction zone. (Sinha-OEIS)
W74-11407

ACID MINE WATER TREATMENT PROCESS,
Kettering Scientific Research, Inc., Yellow Springs, Ohio.
R. W. Treharne, and D. E. Wright.
U.S. Patent No 3,823,081, 3 p, 3 fig, 1 tab, 3 ref; Official Gazette of the United States Patent Office, Vol 924, No 2, p 341, July 9, 1974.

Descriptors: *Patents, *Acid mine water, *Waste water treatment, Pollution abatement, Water pollution control, Water quality control, *Water purification, *Water treatment, Electrolysis, Potable water.
Identifiers: Iron hydroxide precipitate, Sulfuric acid.

A process for electrolytically converting acid mine water to potable drinking water having a neutral pH and a negligible iron content is claimed. The electrolytic cell treatment process has a cathode compartment wherein the pH of the acid mine water is driven basic and an iron hydroxide precipitate is formed. A sand barrier separates the cathode compartment from the anode compartment. In the anode compartment the pH is driven more acidic as sulfuric acid is concentrated. Electrolytic hydrogen evolved in the cathode compartment and electrolytic oxygen evolved in the anode compartment are possible by-products as are the sulfuric acid produced and iron from the iron precipitate produced. Alternatively, the evolved hydrogen and oxygen may be used within the electrolytic system to increase the efficiency. (Sinha-OEIS)
W74-11408

EWAGE FLOCCULATING AND SEDIMENTA-ION TANK UNIT,
ohnson Construction Co. A. B. Solna (Sweden).
. R. Dunkers, and J. H. Johansson.
.S. Patent No 3,822,788, 4 p, 2 fig, 15 ref; Offi-ial Gazette of the United States Patent Office, ol 924, No 2, p 268, July 9, 1974.

escriptors: *Patents, *Flocculation, Sedimentation, *Sewage treatment, Pollution atement, *Waste water treatment, Equipment, reatment facilities, *Settling basins.
lentifiers: Clarification.

rectangular tank consists of two sections, a floc-ulating section and a sedimentation section. Com-artments are formed in each of the sections to ubstantially and uniformly distribute the incom-g sewage and length of the tank. Outlets at the ottom of each of the flocculating sections open to the sedimentation section to guide the sewage om the flocculating section in a direction perpen-icular to the longitudinal axis of the tank and up-ard towards the outlet weir for discharge as arified water. The sewage is agitated in each of e flocculating compartments. The deposited udge is collected and transported by a suction evice. (Sinha-OEIS)

PPARATUS FOR TREATING AND PURIFY-NG SEWAGE, PARTICULARLY SEWAGE ONTAMINATED WITH DETERGENTS,
. Marschall.
.S. Patent No 3,822,786, 3 p, 1 fig, 12 ref; Offi-al Gazette of the United States Patent Office, ol 924, No 2, p 267, July 9, 1974.

escriptors: *Patents, *Ozone, *Detergents, Sewage treatment, Pollution abatement, *Waste ater treatment, Water pollution control, Sedi-entation, Flocculation, Water purification, Ac-vated carbon, Filters.

ewage purification apparatus includes an ozoniz-g container in which the sewage is recirculated nd purified by contact with ozone at substantially tmospheric pressure after passing through a eparator container where oil, grease, fat, and sol-ents are separated and a reaction container where irt and colloidal matter sedimented by a flocculat-g agent are removed. The purified water ithdrawn from the ozonizing container passes rough an activated carbon filter where residual zone in the water is converted into oxygen, and e gases in the upper portion of the ozonizing ontainer pass through an activated carbon filter here surplus ozone is converted to oxygen be-re the gases escape to the atmosphere. (Sinha-EIS)

EWAGE TREATMENT PLANT EQUIPPED /ITH AN AERATION IMPELLER,
R. Kaelin.
.S. Patent No 3,820,764, 3 p, 4 fig, 6 ref; Official azette of the United States Patent Office, Vol 23, No 5, p 1811, June 28, 1974.

escriptors: *Patents, *Sewage treatment, *Waste ater treatment, *Aeration, Pollution abatement, /ater pollution control, Water quality control, reatment facilities.

he sewage treatment plant comprises a basin and motor driven aerator. The aerator is supported at ast at three points. Two supports extend laterally om a platform with at least that portion of each upport adjacent to the platform being inclined ownward and outward at an angle of less than 45 egrees to the horizontal and to the surface of quid in the basin. The third support element con-itutes a bridge or walkway which connects the erator with the basin rim or edge. (Sinha-OEIS)

UNDERWATER SEWAGE COLLECTION SYSTEM FOR DOCKED BOATS,
H. E. Johnson.
U.S. Patent No 3,820,488, 7 p, 7 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 923, No 5, p 1737, June 28, 1974.

Descriptors: *Patents, *Waste water treatment, *Pollution abatement, *Water pollution control, Sewage disposal, Boats, Equipment.
Identifiers: *Sewage collection.

A system is designed to permit the sewage from a boat or ship to be conducted directly to a collection and storage area. The connection comprises a manifold defining a hollow chamber having two sets of inlets and outlets. A float valve associated with the second inlet permits water flow into the manifold but prevents escape of sewage. The sewage from the boat is flushed through the sewage outlet port into the manifold where such sewage is swept with the water into the conduit means for conduction to the sewage receiving and storage equipment. (Sinha-OEIS)
W74-11416

APPLICATION OF BIOLOGICAL FILTERS IN WATER TREATMENT SYSTEMS.
NASA Tech Brief, B73-10404, November, 1973.

Descriptors: Bacteria, *Filters, *Bactericides, Equipment, Water treatment, *Filtration, *Waste water treatment, *Biological treatment.
Identifiers: *Silver iodide.

Regular bacteria filters tend to accumulate bacteria and, when nutrients become available, the bacteria increase exponentially, which increases the possibilities of a breakthrough. Present effective lifetime of most filters is about 10 days. If a bactericide is used to kill bacteria near the filter, the lifetime of the filters can be extended. Silver chloride placed on or close to the barrier will kill the bacteria as they arrive. Dead bacteria accumulate linearly rather than increasing exponentially and hence filter life can be extended up to 30 days. (Shaffer-FIRL)

THE COANDA-EFFECT OIL-WATER SEPARATOR: A FEASIBILITY STUDY,
Naval Civil Engineering Lab., Port Hueneme, Calif.
D. Pal.
Available from NTIS, Springfield, Va., 22161 as AD-774 080, Price $3.25 printed copy; $2.25 microfiche. Technical Note 1331, February 1974. 35 p, 20 fig, 2 tab, 4 ref, 2 append.

Descriptors: *Oily water, *Waste water treatment, *Oil pollution, *Ships, *Separation techniques, Jets, Boundary processes, Boundaries(Surfaces).
Identifiers: *Coanda effect.

An experimental investigation which establishes the feasibility of using the Coanda effect in developing an oil-water separator is described. Tests conducted on an experimental model with an oil-water mixture containing 6% oil showed that the oil content in the effluent can be reduced to less than 3%. A three-stage separator produced effluent in the range of 1%. Conceptual designs of a practical separator are discussed. The space requirement for a Coanda-effect separator when compared with typical parallel-plate type separators of the same capacity is considerably smaller. Analytical expressions useful in designing a Coanda-effect separator of a given size are also given.

OCEAN INCINERATION OF TOXIC WASTES.
Public Works, Vol 105, No 4, p 46-47, April, 1974.

Descriptors: *Hydrocarbons, Toxicity, *Incineration, *Oceans, Burning, Ships, Hydrochloric acid, Marine animals, *Waste treatment.
Identifiers: *Toxic wastes, *Ocean incineration, Combustion chambers, Vulcanus.

Chlorinated hydrocarbons and other toxic wastes may be destroyed by a new method, incineration at sea. A converted German cargo vessel was specially constructed so that its combustion chambers may take toxic wastes from British, Dutch, and Scandinavian companies. An American counterpart is proposed for 1975. The ship reduces the cost of incineration to nearly one half that of land incineration. Chlorinated hydrocarbon wastes are disposed of by incineration at 1400C. This temperature consumes 99 percent of the materials; fumes settle in the ocean and are converted into mild hydrochloric acid, which can be absorbed into the marine life without harm. Burning is done in combustion chambers in the rear of the ship and fumes fall astern into the wake. Burning in the North Sea is done fifty to sixty miles away from the nearest coastline, and clear of shipping lanes. Disposal is checked for conformance to government regulations after each trip. (Prague-FIRL)
W74-11132

THREE TONS IS ALL YOU GET.
Western Dairy Journal, Vol 29, No 8, p 12-13, June, 1973. 2 fig.

Descriptors: *Farm wastes, *Dairy industry, *Waste disposal, *Legal aspects, Cattle, Costs, Water Quality Control, Transportation, *California, Regulation.
Identifiers: *Manure.

A decision by California's Santa Ana Regional Water Quality Control Board states: The discharge of manure waste to lands owned or controlled by the discharger (dairyman) shall not exceed three tons (dry weight) per acre per year. The amount figures to the equivalent of 1.5 times the amount of manure produced by one cow in one year. The dairymen assume that if they can't put the manure on their own property, they must haul it away. But transportation and a place to haul it will be a problem. Also, the decision raises costs and could prevent dairymen from expanding herds to pay for those increases. The newest order requires a dairymen to report any increase in the number of animals by 25% or 100 head-whichever is smaller. (Cartmell-East Central)

5F. Water Treatment and Quality Alteration

INSPECTION OF NEW TREATMENT FACILITIES, THE ROCKVILLE WATER AND AQUEDUCT COMPANY,
Rockville Water and Aqueduct Co., Conn.
W. N. MacKenzie.
Journal of the New England Water Works Association, Vol 88, No 1, p 1-18, March, 1974.

Descriptors: *History, Organic wastes, Wastes, Water quality, Wastewater treatment, Potable water, Lakes, *Connecticut, *Treatment facilities, Water treatment, *Water pollution control.
Identifiers: Rockville(CT), Lake Snipsic.

The history of the Rockville Water and Aqueduct Company of Rockville, Connecticut is presented. A chronological summary of construction and events dating back almost 150 years is presented including a list of people important to the development of the company. The company was organized under a charter granted in April, 1893 as a result of the merger of the Rockville Water Power Company and Rockville Aqueduct Company. The company was concerned with controlled water pollution as early as 1907 when Lake Snipsic and its tributaries were examined for sources of pollution. The company acquired additional land for the sole purpose of protecting from pollution the drinking water supplied to the city. Anti-pollution rules were established in 1911 for those using the lake shore front. Organic wastes and refuse matter were forbidden to be deposited in the lake. (Merritt-FIRL)

ANDOVER GIVES SHOT TO SUPPLY,
Massachusetts Dept. of Public Works, Andover.
R. E. McQuade, and C. E. Fuller.
Water and Wastes Engineering, Vol 11, No 5, p 32-37, May, 1974. 11 fig.

Descriptors: *Water treatment, *Municipal water, *Treatment facilities, *Design criteria, *Costs, Filtration, Construction, Engineering, Water supply, *Massachusetts, Water supply, Potable water.
Identifiers: Public works, Andover(Mass).

Andover, Massachusetts recently completed construction of a new drinking water filtration plant with an ultimate capacity of 24 mgd. The plant currently draws water from Haggets Pond to supply the town's 24,000 residents and commercial and industrial users. In the future it is planned to augment this supply by drawing water from the Merrimack River. Included are the costs breakdown of building as well as basic design data, equipment used in the plant, and estimated operating costs for 1974. (Shaffer-FIRL)
W74-10944

APPLICATION OF MONITORING TECHNOLOGY (FOR ASSURING) DRINKING WATER QUALITY,
National Sanitation Foundation, Ann Arbor, Mich.
N. I. McClelland, J. R. Adams, R. R. Wood, and K. H. Mancy.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 54-55, 1974.

Descriptors: *Monitoring, *Water quality, *Automation, Data collections, Data processing, Municipal water, *Potable water.

Sensor systems were combined with newly developed automated electrochemical techniques in a mobile, computerized potable-water monitoring laboratory. Eighteen parameters are included in the system: temperature (thermistor); pH and alkalinity (glass electrodes); conductivity (a-c conductivity cell); turbidity (nephelometer); dissolved oxygen (voltammetric membrane electrode); chlorides, free and total fluorides, nitrates, and hardness (ion selective electrodes); free and total residual chlorine (galvanic cell); copper, cadmium, and lead (differential anodic stripping voltammetry); corrosion (polarization admittance technique); and deposition rate (calcium carbonate deposition test). TRACE ORGANIC CONTAMINANTS IN DRINKING WATER; EVALUATION OF SEMIPERMEABLE MEMBRANES AND OSMOTIC PUMPING TO ACHIEVE CONCENTRATION,
Gulf South Research Inst., New Orleans, La.
I. Cabasso, E. Klein, C. Eyer, and J. Smith.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 204-210, 4 tab, 7 ref.

Descriptors: Water analysis, *Membrane processes, *Potable water, Chemical analysis, Separation techniques, Analytical techniques, *Pollutant identification, Membranes, Reverse osmosis, *Organic compounds, *Water treatment, *Semipermeable membranes.
Identifiers: Trace organic compounds.

Concentration and retention for analysis of trace organic chemicals found in water were studied using membranes which are impermeable to organics and which are highly permeable to water. Three polymeric membranes were chosen for this study; two are asymmetric membranes of cellulose acetate and ethyl cellulose, and the third is a thin barrier coating polyethyleneimine condensate formed with toluene isocyanate in situ on a polysulfone porous support. The solute concentration in water was in the range of 100-1,000 ppm. Rejections were found to be significantly higher for the polyurea membrane than for the cellulosic derivatives. In general, rejection coefficients for ionizable species were much higher than those for the nonionizable ones. (See also W74-10947) (Knapp-USGS)

TRACE ORGANIC CONTAMINANTS IN DRINKING WATER; THEIR CONCENTRATION BY REVERSE OSMOSIS,
National Environmental Research Center, Cincinnati, Ohio.
M. Dienzer, R. Melton, D. Mitchell, F. Kopfler, and E. Coleman.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 211-217, 1974. 1 fig, 2 tab, 8 ref.

Descriptors: *Water analysis, *Membrane processes, *Potable water, Chemical analysis, Separation techniques, Analytical techniques, *Pollutant identification, Membranes, *Reverse osmosis, *Organic compounds, *Water treatment.
Identifiers: *Trace organic compounds.

A reverse osmosis method was developed for concentrating trace organic compounds in large volumes of water. Organic chemicals of sufficiently high molecular weights, arbitrarily defined as greater than 200, will diffuse very poorly through the membrane and will tend to be rejected, irrespective of their membrane solubilities. Compounds of low molecular weights with minimal spatial requirements but of poor membrane solubility will also be rejected. (See also W74-10947) (Knapp-USGS)

SPECIAL WATER FOR SPECIAL PAPER.
Rohm and Haas Reporter, Vol 32, No 1, p 15-17, Spring 1974. 4 illus.

Descriptors: *Industrial water, *Water treatment, *Boiler feed water, *Pulp and paper industry, *Water purification, *Water softening, *Ion exchange, Resins, Europe, Electric insulation, Water supply.
Identifiers: Amberlite ion-exchange resins, *Finland, Electrical papers, Capacitor paper, Dielectric papers.

Two Finnish paper mills use Amberlite ion-exchange resins for purification, especially deionization, of the process water supply needed in the manufacture of contaminant-free kraft pulps for use in electric insulation papers. Kemi Oy. in Karihaara near the Arctic Circle uses three separate water treatment lines, each comprising two large columns of mixed-bed ion-exchange resins. A similar installation is used for softening of boiler feed water supplied to the mill's power plant. In the vicinity of Helsinki in southern Finland, Tervakoski Oy. uses four trains, each comprising one cation-exchange, one weak and one strong anion-exchange, and one mixed-bed unit, to supply high-purity water needed in the manufacture of capacitor tissues and similar electrical papers. eservoirs, Copper sulfate, Algicides, Illinois,
trients, Biological treatment, Intakes, Destratification, Aeration, Ultrasonics, Hardness(Water), Rotifers, Viruses, Chemcontrol, Application methods, Environmental effects, Bottom sediments.

Various methods of algal growth control (nutrient control, biological control, water intake location, destratification, light exclusion, ultrasonic radiation, and alternative algicides) were compared with the copper sulfate method. The most direct and environmentally desirable solution in water supply reservoirs is control of critical nutrients input. A literature search, questionnaires to each state agency responsible for water supplies, and contacts with individuals actively pursuing research in the area of algal growth control revealed that a generally applicable method more environmentally desirable than copper sulfate application has not been found. In evaluating copper levels that are safe for fish and other aquatic organisms, the extreme variability in toxic limits depend on the physical and chemical characteristics of the water. Copper is most toxic in soft waters. Hard waters, common in Illinois, cause rapid precipitation of the added copper as hydroxide and/or carbonate, thus greatly reducing toxic effects. The potential exists for ecological harm due to buildup of copper in bottom muds of reservoirs and streams fed by reservoirs that receive copper sulfate over extended periods of time. However, studies reported in the literature generally have failed to demonstrate that aquatic organisms have been affected by copper buildup in the sediment. (Auen-Wisconsin)

STATE OF TEETH IN CHILDREN IN THE FOCUS OF ENDEMIC FLUOROSIS, (IN RUSSIAN),
Central Research Inst. of Stomatology, Moscow (USSR).
A. I. Rybakov, and G. V. Baziyan.
Stomatologiya. Vol 51, No 1, p 42-48. 1972. Illus. English summary.

Descriptors: *Fluorides, Public health, Potable water.
Identifiers: Children, Fluorosis, Kolomna(USSR), Teeth.

Data from a mass stomatological examination of children born and living in the focus of endemic fluorosis of Kolomna, USSR and of those in a control district of the same town where there is an optimal fluoride content in the drinking water were compared. The intensification of the fluoride influence on the milk teeth with increase of its concentration in the drinking water and an absence of effect on permanent teeth were revealed. This was probably due to differences in the degree of maturity of enamel of milk and permanent teeth directly after their dentition. Studies were made of the spread of dental fluorosis of different degrees of severity in preschool children and schoolchildren and the incidence of disorders of separate teeth. A computer study of stomatological examinations of 1741 children (10-17 yr old) established a relationship between the spread of dental fluorosis, the time of birth and the injurious effect of fluoride during the first yr of life. The canine teeth and second molars were most often affected. Teeth on the mandible were less often affected by fluorosis.--Copyright 1974, Biological Abstracts, Inc.

RIVER AVON COULD CONSIST LARGELY OF SEWAGE EFFLUENT.
Water and Wastes Treatment, Vol 17, No 1, p 13, January, 1974.

Descriptors: Water supply, *Water supply development, Water resources development, Rivers, Reservoirs, *Sewage, Effluents, *Water quality control, Groundwater resources.
Identifiers: *United Kingdom(River Avon), Bristol Avon River Authority(UK).

The report of the Bristol Avon River Authority warning that the River Avon could consist largely of sewage effluent is discussed. Water supplies are not limitless and the rising demand, which stems from increased per capita usage as well as population growth, could not only outstrip supply but also have a disastrous effect on the River Avon system. There are two solutions: water can be imported from other areas or local resources can be developed by river regulation and developing and optimizing groundwater resources. Future public water supply needs which by the year 2001 will exceed present resources by 66 million pgd can be met by constructing a new reservoir. (Merritt-FIRL)

A FIELD TRIAL OF ABATE LARVICIDE FOR THE CONTROL OF AEDES AEGYPTI IN BANGKOK, THAILAND,
World Health Organization, Bangkok (Thailand). Aedes Research Unit.
Y. H. Bang, and C. P. Pant.
Bull W H O. Vol 46, No 3, p 416-425, 1972.

Descriptors: *Aedes-aegypti, Breeding, Control, Fever, Larvicides(Abate), Mammals, *Thailand(Bangkok), Asia, Human diseases, Disease vectors.

In countries of southeast Asia, and particularly in Thailand, the practice of storing water for drinking and for household use in earthenware and cement jars in and around the house is widespread. These containers are the main breeding sites for Ae. aegypti, the vector of hemorrhagic fever in man. In the absence of a safe and effective vaccine against dengue hemorrhagic fever, vector control is the only way to prevent the spread of this disease at present. The low toxicity of Abate for mammals, combined with its long residual effectiveness against Aedes larvae at the low concentration of 1ppm and the fact that the active ingredient is released from the 1% sand granule formulation and retained by the walls of water containers, makes it feasible to use this formulation for long-term control of Ae. aegypti.--Copyright 1973, Biological Abstracts, Inc.

In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 56-60, 1974. 1 fig, 1 tab.

Descriptors: *Monitoring, *Water quality standards, *Automation, Water pollution, Industrial wastes, Sampling, Mercury, Phosphorus, Cadmium, Lead, Chromium, Arsenic compounds, Public health.
Identifiers: *Japan, Cyanide.

National Water Quality Criteria of Japan were established in April 1970. The criteria concerning human health were established for cyanide, alkyl mercury, organic phosphorous, cadmium, lead, chromate, arsenide, and total mercury. Aichi prefecture installed the first automatic monitoring system for river water quality. (See also W74-10947) (Knapp-USGS)

NPDES SELF-MONITORING AND REPORTING REQUIREMENTS,
Environmental Protection Agency, Washington, D.C. Permit Programs Div.
N. Lailas.
In: Preprints of Papers Presented at the 167th National Meeting of the American Chemical Society, April 1-5, 1974, Los Angeles, Calif: American Chemical Society, Division of Environmental Chemistry, Vol 14, No 1, p 108-110, 1974.

Descriptors: *Monitoring, *Water pollution sources, *Federal water pollution control act, *Regulation, *Water quality act, Water pollution control, Legislation, Law enforcement.

On October 18, 1972, the Federal Water Pollution Control Act Amendments of 1972 were enacted. One of the major features of this sweeping revision of the Federal Water Pollution Control Laws was the establishment of a new national permit system. This key water pollution control mechanism has the title of National Pollutant Discharge Elimination System (NPDES). This Act requires that industrial, municipal and other point source dischargers obtain permits for the discharge of any pollutants into the navigable waters of the United States. The permit that will be issued under the NPDES has a basic format of effluent limits, a compliance schedule, and monitoring requirements. (See also W74-10947) (Knapp-USGS)

A SYSTEMS APPROACH TO PROBLEM ORIENTED RESEARCH PLANNING: A CASE STUDY OF FOOD PRODUCTION WASTES,
International Research and Technology Corp., Arlington, Va.
T. B. Taylor, D. Coillett, R. McKenna, D. Overly, and S. Perelman.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-228 114; $4.50 in paper copy, $2.25 in microfiche. Final Report, IRT-244-R, June 1973. 105 p, 32 fig, 5 tab, 7 ref.

Descriptors: *Research and development, *Planning, *Systems analysis, *Agriculture, *Wastes, *Pollution abatement, Water pollution, Air pollution, Land, Environmental sanitation.
Identifiers: *Technology assessment, Food production, Disaggregation.

Considered are two separate but interrelated topics: (1) the development and assessment of a systems approach to the identification of research needs; and (2) use of this approach in formulating a research program on problems dealing with wastes which result from U.S. food production. The method utilizes hierarchical formats for describing systems for providing goods or services and possible problems and problem solutions associated with the systems. System components, problems and possible corrective measures are progressively disaggregated and analyzed at greater levels of detail. Reported is the application of such a systems approach to the area of environmental pollution caused by release of wastes produced during the cultivation and processing of food plants, the raising of food animals, and the processing of food animal products. Problems and possible solutions requiring further research have been identified and rank ordered. The procedures developed and used in this study can provide a practicable, systematic framework for planning research programs related to areas of major national concern. (Bell-Cornell)

FLOATING BOOM DEPLOYMENT APPARATUS,
Pacific Pollution Control, San Francisco, Calif. (assignee)

D. Tanksley.
S. Patent No. 3,807,617, 3 p, 3 fig, 2 ref; Official zette of the United States Patent Office, Vol , No 5, p 1923, April 30, 1974.

scriptors: *Patents, *Pollution abatement, *Oil lution, *Oil spills, Water quality control, Water lution control, Equipment, Separation hniques.
ntifiers: Deployment apparatus, *Booms.

e deployment apparatus is comprised of a reel storage, paying out and retrieval of the boom. lide is formed for support of the partition which ds the float. The slide is formed by a pair of s extending longitudinally in the direction of loyment of the partition and positioned in izontally spaced relation at a distance for eipt of the float between the rails. The rails are ported on vertical posts and have interconnect- cross members which define a channel for sage of the float between the rails. (Sinha-IS)

OATABLE BOOM STRUCTURE,
ıera Projecting A. B., Nordmaling (Sweden). signee)
D. Oberg.
S. Patent No. 3,798,911, 6 p, 15 fig, 5 ref; Offi- Gazette of the United States Patent Office, 1 920, No 4, p 1087, March 26, 1974.

scriptors: *Patents, *Oil spills, *Oil pollution, llution abatement, *Water pollution control, ater quality control, Equipment, Barrier.

e boom consists of buoyant tubular body sec- ıs arranged in series along the length of the m. Each body section defining therein at least closed compartment, mechanical expansion ans within each compartment, and expansion ices. The boom becomes buoyant when eased from a flat storage state. The tubular ly sections when expanded are positioned so t they project upward above the surface to an ent sufficient to contain floating impurities. Air sages into each compartment prevent the entry water into these compartments. (Sinha-OEIS)

L SLICK REMOVAL METHOD, SYSTEM D BAG THEREFOR,
L. Avey.
S. Patent No. 3,796,656, 4 p, 17 fig, 7 ref; Offi- Gazette of the United States Patent Office, 1 920, No 2, p 474, March 12, 1974.

scriptors: *Patents, *Oil spills, *Oil pollution, llution abatement, *Water pollution control, ater quality control, Separation techniques, uipment.

rge plastic bags, initially rolled on a drum, or erwise collapsed, are deployed horizontally so t the bags envelop a strip of oil slick on a body water. When each bag is fully deployed it is eased and the mouth, which is weighted, sinks he bottom of the body of water, or if the latter leep enough, the bag floats at the surface with weighted mouth hanging downward in the ter. The oil collects at the uppermost closed end the bag, where it can be removed either for se or disposal. (Sinha-OEIS)
4-11055

UNDERWATER LEAKAGE OIL COLLECTOR SYSTEM,
D. E. Rainey.
U.S. Patent No. 3,756,294, 3 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 914, No 1, p 124-25, September 4, 1973.

Descriptors: *Patents, *Oil pollution, *Pollution abatement, *Water quality control, *Water pollution control, Leakage, Equipment, Conduits.
Identifiers: *Pollution prevention, Underwater leakage.

To prevent leakage from an underwater break in an oil container by entrapping the escaping oil and conveying it to a new collector, an elongated, flexible and impervious conduit is attached to the source. The conduit has an inverted channel-shaped mouth composed of cushioned sealing material and flexible magnet for mating engagement with the leakage point. The bottom portion of the mouth remains open to permit entry of water into the conduit to float the entrapped oil and accelerate its passage upward through the conduit. (Sinha-OEIS)
W74-11056

APPARATUS FOR REMOVING A SUBSTANCE FLOATING AS A LAYER ON THE SURFACE OF A BODY OF LIQUID,
Bertin and Cie, Plasier (France); and Entreprise de Recherches et d'Activites Petrolieres, Paris (France). (assignees)
J-C. J. Mourlon, and E. M. R. Dubois.
U.S. Patent No, 3,800,951, 10 p, 37 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 921, No 1, p 173, April 2, 1974.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Pollution abatement, *Water quality control, *Water pollution control, Flotsam, Equipment, Separation techniques.

A screw impeller generates a whirlpool in the vicinity of the substance flotsam or oil. This causes a depression of downward tapering closed bottom cup-shaped outline. The unwanted substance which accumulates may thereafter be withdrawn. The operation of the equipment is as follows: A platform is brought to the area requiring treatment and is anchored. The motor is started up to turn the screw impeller. The light substance (oil) is centripetally drawn from the depression. A suction pump is started and is adjusted to a suitable flow-rate delivering the light substance to a collection tank. (Sinha-OEIS)
W74-11057

PROCESS FOR TREATING OIL SLICKS USING CHEMICAL AGENTS,
Chevron Research Co., San Francisco, Calif. (assignee)
R. L. Ferm.
U.S. Patent No. 3,810,835, 3 p, 3 tab, 5 ref; Official Gazette of the United States Patent Office, Vol 922, No 2, p 593, May 14, 1974.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Pollution abatement, Water pollution control, Water quality control.
Identifiers: *Chemical treatment, N,N-dialkyl amides, Glycols.

A chemical agent is applied to the vicinity of an oil spill in an effort to contain the spill. It is applied in such manner as to compress or gather the oil into a limited area. It is prefered to completely surround the slick with the chemical agent thereby compressing the oil spill into a limited area, preventing its spread. The chemical agent is selected from the group consisting of (1) N,N-dialkyl amides; (2) n-alkyl and n-alkylene monoethers of (a) ethylene glycol and (b) polyethylene glycol, (3) polyethylene glycol monoesters of n-alkyl acids; and (4) n-alkyl and n-alkylene monoesters of propylene glycol. (Sinha-OEIS)
W74-11059

FLOATING ANTIPOLLUTION BARRIER DEVICE.
Pneumatiques Caoutchouc Manufacture et Plastiques Kleber-Colombes (France).
L. Ballu.
U.S. Patent No. 3,811,285, 6 p, 6 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 922, No 3, p 712, May 21, 1974.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Pollution abatement, Water quality control, Water pollution control, *Barriers, Separation techniques.

A floating barrier has a submerged skirt-like structure that is supported by floating devices. It comprises a longitudinal band of an air-tight pliable material folded in the longitudinal direction to provide two walls with the fold in the upward direction and an opening in the downward direction. Pockets are formed between the two walls and expanded when filled with air. The air is trapped when the barrier is placed in the water. (Sinha-OEIS)
W74-11060

APPARATUS FOR COLLECTING SURFACE PARTICLES ON BODY OF WATER,
L. Carter.
U S Patent No 3,811,325, 3 p, 4 fig, 5 ref; Official Gazette of the United State Patent Office, Vol 922, No 3, p 722, May 21, 1974.

Descriptors: *Patents, *Sampling, *Water quality, Pollutants, Ecology, *Flotsam, Equipment, *Pollution abatement.

The sampling device which is towed on the surface of the water is supported by two parallel, longitudinal floats. A rigid tubular framework with two horizontal hydrofoil bodies transverse to the floats is secured to the framework within the profile of the floats. The vertically stacked hydrofoil bodies define an intake opening, with the lower hydrofoil maintaining the intake opening at a predetermined depth below the water without causing disruptive turbulence, while the upper hydrofoil causes the sampling device to ride over swells and waves. The towing motion causes surface water to flow into the intake opening, where the flotsam is collected by a funnel-shaped net which has its wide end secured to the intake opening. The net, with the narrow end terminated by a collecting screen, lies partially submerged between the floats. (Sinha-OEIS)

HISTORICAL DEVELOPMENT OF WATER POLLUTION CONTROL COST FUNCTIONS,
National Environmental Research Center, Washington, D.C.
D. P. Tihansky.
Journal of the Water Pollution Control Federation, Vol 46, No 5, p 813-833, May 1974. 31 fig, 2 tab, 151 ref.

Descriptors: *Reviews, *Bibliographies, *History, *Cost analysis, *Cost-benefit analysis, Mathematical studies, *Mathematical models, *Water quality control, *Water pollution control, Pollution abatement, Planning, Decision making, Social needs, Social aspects, Federal government, Legislation, Federal Water Pollution Control Act, Resource allocation, Research and Development, Costs, Cost-benefit theory, Comparative costs, Waste water treatment, Waste treatment.

Because functions depict the sensitivity of treatment costs to changes in the values of determinants, they are useful in selecting the least cost strategies of water quality control. The development of cost functions received its impetus from federal support in the mid-1960's. Major publications soon appeared, largely on municipal waste control, some on industrial waste control. Continuation of such studies was encouraged by recent amendments to the Federal Water Pollution Control Act. Although treatment cost estimates are important to decision makers, they do not reveal the complete framework of economic considerations. Costs should be compared to water use benefits if strategies are designed to improve social welfare. If maximization of social welfare is the goal, both cost and benefit functions will be valuable in water quality planning models. Research on benefit functions should progress rapidly, owing to congressional and other federal interest. Opportunity costs are also to be considered in optimized allocation of resources. Some of the most comprehensive and best known cost function reports are highlighted in this review; additional pertinent studies are also listed in the appended bibliography. (Brown-IPC)

ADAPTIVE CONTROL APPLIED TO A WATER QUALITY SYSTEM,
Newark Coll. of Engineering, N.J.
H. J. Perlis.
Instrument Society of America Transactions, Vol 13, No 1, p 31-34, 1974. 1 fig, 3 tab, 13 ref.

Descriptors: *Model studies, *Control, *Water pollution, *Computers, Costs, Biochemical oxygen demand, Dissolved oxygen, Loading, Streams, Temperature, Mathematical studies, *Water quality control, Effluents.
Identifiers: Open-loop adaptive control.

A model system for a crude form of adaptive control has been applied to water pollution control problems. Its principle is response to changes in temperature, reacting with a computer. This is called open-loop adaptive control. A two-element control vector in a number of reaches of stream (not contiguous) is used. Cost/benefit tradeoffs are incorporated into the scheme. Results show a reduction in overall theoretical cost and an improvement in DO level maintenance and BOD loading. (Prague-FIRL)

PROTECTION OF THE ENVIRONMENT DURING DEMOLITION ACTIVITIES,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Weapons Effects Lab.
F. W. Skinner, L. Miller, and W. Harvey.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-772 920, Price $3.75 printed copy; $2.25 microfiche. Miscellaneous Paper N-73-6, December 1973. 57 p, 6 fig, 2 tab, 42 ref.

Descriptors: *Construction, *Explosives, *Pollution abatement, *Water pollution control, Explosions.
Identifiers: *Environmental protection, *Demolition.

New demolition techniques were developed to minimize hazards to the environment in areas with demolition activities. Basic guidelines and optional plans of action to be considered in planning demolition projects are discussed. Current Army policies concerning protection of the environment from demolition operations are in step with broad Federal policies aimed at improving the national level of environmental quality. Preliminary guidance, aimed at protecting or improving the ambient environment, is provided for elements of the Army undertaking on-base demolition projects. (Knapp-USGS)

ANALYSIS OF LIGHTWEIGHT OIL CONTAINMENT SYSTEM SEA TRIALS,
Hydronautics, Inc., Laurel, Md.
E. Miller, W. Lindenmuth, and R. Altmann.
Available from NTIS, Springfield, Va 22161 as AD-770 344, Price $4.00 printed copy; $2.25 microfiche. Coast Guard Interim Technical Report No CG-D-22-74, October 1973. 128 p, 49 fig, 7 tab, 5 ref.

Descriptors: *Oil spills, *Water pollution treatment, Oily water, *Separation techniques, Sea water, Equipment, Pollution abatement.

Full scale tests of a lightweight oil containment system were carried out in March 1972 off Point Conception, California, using refined soy bean oil. The oil loss was a strong function of towing speed and sea conditions. The major mechanism of oil loss was entrainment of droplets formed at the headwave and by motions of the air bags. (Knapp-USGS)

Descriptors: *Water quality standards, *Trophic level, *Algae, Oxygen demand, Coliforms, Sampling, Bioindicators.
Identifiers: USSR, *Trophic character.

Based on the results of chemical, bacteriologica and biological tests the extension is recommende of parameters for determining the hygienic quality of surface waters (as based on oxygen consump tion, coliform counts, and saprobic character) The adoption of 'trophic character' is advised which is evaluated by the number of algae found i a volume of water. 'Trophic character' determine on the basis of floral organisms has no direct rela tionship with the saprobiological feature whic determines the group classification for hygieni surface water utilization. The water qualificatio involving new parameters generally results in worse grouping of classifications. Evaluation o floral microorganisms (algae) draws attention t biological phenomena (mass production, flourish ing of water) that influence water consumptio primarily from the technological point of view and hint at their effects (mechanical, taste an odor effects). Statistical evaluations also confirm the necessity of adopting the new parameters i water qualification. (Shaffer-FIRL)

National Oceanographic and Atmospheric Ad ministration, Juneau, Alaska.
D. R. Evans, and S. D. Rice.
Fishery bulletin, Vol 72, No 3, p 625-638, 1974. 7 ref.

Descriptors: *Publications, *Reviews, *Oil *Marine biology, Bibliographies, Documentation Oil spills, Ecosystems, Toxicity, Water pollutio sources, Water pollution effects, Organic com pounds, Environmental effects, Biodegradation Sediments, Food web, Laboratory tests, On-sit investigations.
Identifiers: *Crude oil, Long-term impacts Sublethal effects.

A broad selection of recent literature on the e fects of oil on marine ecosystems is reviewed. Th focus is on studies on crude oil, and the results a discussed with the purposes of providing a sum mary of findings that will be useful as a referenc for administrators and policy makers involved decisions concerning petroleum developments ar related activities. The characteristics of crude o and factors modifying its impact on the marine e vironment are discussed. Most research on t toxicity of oil has dealt with acute effects and da on long-term impacts at the community level a inconclusive. It is concluded that chronic low-lev pollution is potentially more damaging ecosystems than isolated catastrophic spills. De

sion makers are forced to rely on interpretive judgments rather than conclusive data. (Katz)

PROPELLING ARRANGEMENT FOR OIL AND GARBAGE SKIMMER CRAFT,
A. Y. Derzhavets, P. G. Kogan, V. N. Semenov, and V. I. Tabachnikov.
U.S. Patent No 3,823,828, 4 p, 2 fig, 1 reg; Official Gazette of the United States Patent Office, Vol 924, No 3, p 544, July 16, 1974.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Skimming, *Pollution abatement, Water pollution control, Water quality control, Flotsam, Equipment.
Identifiers: *Skimmers.

A propelling arrangement divides the water flow entering a skimmer craft into two streams. One stream is a surface layer of water which contains floating impurities entering the collecting receptacle. The other is the underlying layer of water entering the duct for delivery to the water jet. There is thus a simultaneous drawing in of the surface layer of water together with floating impurities towards the intake of the collecting receptable. At the same time, the water flow running through the duct towards the water jet, due to the effect of the ejection passage draws water off the collecting receptacle to provide a difference in the level of water in the collection receptacle and that of the surrounding water, which is needed for the inflow to the collecting receptacle of the layer of water which contains floating impurities. (Sinha-OEIS)
W74-11404

OIL SKIMMER MODULE WITH FREE FLOATING WEIR TROUGH,
A. J. Crisafulli.
U.S. Patent No 3,822,789, 5 p, 9 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 924, No 2, p 268, July 9, 1974.

Descriptors: *Patents, *Oil pollution, *Oil spills, *Pollution abatement, Water pollution control, Water quality control, Skimming, Equipment, Separation techniques, *Weirs.
Identifiers: *Skimmers.

The skimmer incorporates a sump box having a pump for conveying material from the sump box to the floating barge or vessel. A free floating weir is disposed forward of the sump box. The connection is such that the weir may rise in relation of the sump box which maintains its position in the water. Ball joint connections between the sump box and the weir guide the limited motion between them. The sump box is oriented so that at least a portion remains below the surface of the water. A gravity inlet receives a thin layer of water and the floating pollutants. (Sinha-OEIS)
W74-11409

METHOD FOR THE CONTROL OF OILS FLOATING ON WATER,
Tenneco Oil Co., Houston, Tex. (assignee)
R. E. Gilchrist, and J. C. Cox.
U.S. Patent No 3,821,109, 4 p, 7 ref; Official Gazette of the United States Patent Office, Vol 923, No 5, p 1891, June 28, 1974.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Pollution abatement, *Water pollution control, Water quality control, *Separation techniques, Catalysts.
Identifiers: Liquid alcohols, Glycerids, Ketones, Ethers, Chemical treatment.

Oil spills are controlled by dispersing on the surface, a composition of matter comprising a drying oil and a carrier for the drying oil. The drying oil contains a major proportion of a component selected from the class consisting of unsaturated fatty acids, glycerids of unsaturated fatty acids and mixture thereof. It should contain from about 50 to 90 percent by weight of a carrier selected from the class consisting of liquid alcohols, ketones and ethers; and from about 1 to 10 percent by weight of a water insoluble metallic soap catalyst. (Sinha-OEIS)
W74-11413

LEGAL CONTROLS OF POLLUTION IN THE GREAT LAKES BASIN,
Ontario Water Resources Commission, Toronto.
H. Landis.
Canadian Bar Review, Vol 48, p 66-157, 1970.

Descriptors: *Legal review, *Legislation, *Groundwater, *Surface water, *Pollution, *Law enforcement, *Canada, Great Lakes region, Harbors, Canals, Fisheries, Agriculture, Indian reservations, Water resources, Municipal water, Planning, Pesticides, Public health, Air pollution, Mining, Migratory birds.

Legal control of pollution of groundwater and surface waters in the Canadian part of the Great Lakes Basin is discussed, and the constitutional basis of such controls is considered. Provincial rather than federal primacy is recommended. Provisions of several laws are reported, including those of the Ontario Water Resources Commission Act; the Municipal, Drainage, Public Parks, and Planning acts; the Public Health and Pesticides Acts; the Conservation Authorities Act; the Energy, Gasoline Handling, and Air Pollution Control Acts; the Mining Act; the Lakes and Rivers Improvement, Public Lands, and Provincial Parks Acts; the Migratory Birds Convention Act; and the Canadian Water Act. Judicial decisions concerned with federal harbors, and canals, inland fisheries, agriculture, and Indian lands are also reviewed. (Shaffer-FIRL)
W74-11417

CONTROL OF SULFUR OXIDE POLLUTION FROM POWER PLANTS,
National Environmental Research Center, Research Triangle Park, N.C.
F. T. Princiotta.
Available from NTIS, Springfield, Va., 22161 as PB-228 706, Price $5.75 printed copy; $2.25 microfiche. March 14, 1972. 51 p, 12 fig, 6 tab.

Descriptors: *Sulfur compounds, *Air pollution, *Powerplants, Sulfates, Acids.
Identifiers: Air pollution control.

A significant contribution of SO2 control within the next five years is possible using the wet lime/limestone scrubbing process, wet magnesium oxide scrubbing, and catalytic-oxidation. At least 20 full-size desulfurization control processes for powerplants are in the design, construction or operation phase in the United States at this time. Nineteen of these use one of the three processes listed above; 16 of these are wet lime/limestone systems. The magnesium oxide (MgO) scrubbing process is similar to wet lime/limestone processes, except that the magnesium sulfite and sulfate reaction products are regenerated, producing a concentrated stream of SO2 for H2SO4 production and regenerated MgO for reuse. Wet lime/limestone processes have the lowest capital cost, followed by MgO; the catalytic oxidation process is the most expensive. The control processes discussed offer an economic incentive for use over low-sulfur fuel for many power plants, although power plant location and the fossil fuel type used strongly affect any comparison. ASSESSMENT OF SELECTED RANN ENVIRONMENTAL MODELLING EFFORTS,
Washington Univ., Seattle.
B. W. Mar, and W. T. Newell.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-227 217; $6.75 in paper copy, $2.25 in microfiche. Report No NSF/RA/E-73-004, June 1973. 64 p, 3 tab, 14 ref. NSF FI-36373.

Descriptors: *Mathematical models, *Assessments, *Environment, Data collections, Projects, Surveys, Costs, Systems analysis, *Model studies.
Identifiers: *Environmental modeling, *Interdisciplinary modeling, Experiments.

Reported are results of an experiment conducted to assess and document interdisciplinary environmental modelling activities. Groups of modellers visited each of 11 RANN projects to stimulate inter and intra project discussions of the process of modelling. Results indicate that the process is seldom recorded, and the technology of interdisciplinary modelling has not ben documented0 ffort fails to maximize use of past experiences, and three common issues are faced time and again: (1) how to define and bound the model; (2) how to direct the team to ad0ress the construction and validate the defined model; and (3) how to document and communicate the model or its results. The final step in the experiment was analysis and synthesis of the collected data. Data sets included: (1) response to survey of project modelling goals and concerns; (2) summary of project content and of on-site discussion of the project modelling process; and (3) reports generated by individual projects. The latter two items are summarized in an appendix. It is almost impossible to construct a model when some specific boundaries and structure are lacking. A major incentive for documentation of the process as well as the substance of the model is required. Needed is an accounting system which provides a measure of the real cost of model development and use. (Bell-Cornell)

W.A.L.R.U.S. WATER AND LAND RESOURCE UTILIZATION SIMULATION PLAYER'S MANUAL (WISCONSIN VERSION),
Wisconsin Univ., Madison.
C. Thurow, J. Steinhart, and T. Smith.
Available from the National Technical Information Service, Springfield, Va 22161 as COM-73-11951 $2.75 in paper copy, $2.25 in microfiche. University of Wisconsin, Sea Grant Advisory Report No. 3, May 1973. 3 fig, 3 tab, 19 p.

Descriptors: *Simulation analysis, *Resources, *Water utilization, *Land use, Environment, Constraints, Decision making, Governments, Regions, Industries, Water pollution, Effluents, Agriculture, Recreation, Legislation, Cities, Tax rates, Systems analysis, Sewers.
Identifiers: *Game theory, Goal establishment, Strategies, Environmental quality.

WALRUS is a game about the processes of establishing goals and strategies for implementing them in a heterogeneous environment. The environment is represented by the physical and social realities simulated in the game: a medium-size town, Walton, situated on a bay and surrounded by two predominately rural townships. The game is played in rounds which represent approximately a year's time. Players attempt to control, and possibly optimize, their own position and the status of the region with respect to any one or more of four basic elements: economic strength, political strength, personal status and prestige, and overall environmental quality of the water resources. The lack of consensus among possible goals, or the complexity of establishing a consensus, is probably one of the more realistic aspects of this simple form of simulation modeling. Players must deal with two major physical contraints; (1) natural limitations of available land and the inevitable trade-offs in land-use decisions; and (2) water pollution. The major complexity in the game's environment involves the interaction of teams and the governmental units. The game is controlled by 'man-made laws' and by 'natural laws.' The former exist for each of three political jurisdictions. The latter include land-use characteristics, water and sewer characteristics, and influents and votes. (Bell-Cornell)

THE INTEGRATION OF SYSTEM IDENTIFICATION AND SYSTEM OPTIMIZATION,
California Univ., Los Angeles.
Y. Y. Haimes.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-234 828, $10.70 in paper copy, $2.25 in microfiche. Ph D Dissertation, 1970. 147 p, 12 fig, 44 ref, 5 append. OWRR A-033-CAL(1).

Descriptors: *Optimization, *Analytical techniques, *Model studies, *Equations, Systems analysis, Algorithms, Constraints, Digital computers, Conjunctive use, Groundwater, Surface waters.
Identifiers: Production plants, Problem-solving.

The coupling relationship between system identification and system optimization is analyzed. Four approaches for the solution of the joint problem are proposed, as applied to both static and dynamic system modeling. The Equivalence Theorem shows the equivalency between the bicriterion problem where two objective functions are minimized. The epsilon-constraint approach which views one of the objective functions as a constraint is introduced and proved. Decomposition multilevel optimization are discussed in the context of solving the integrated problem. The epsilon-constraint method is investigated in detail and shown to be feasible. Two example problems are introduced, formulated, and solved. The production plant problem, which is a nonlinear static identification and static optimization problem, is solved via decomposition and multilevel optimization techniques following the epsilon-constraint approach. A static identification and dynamic optimization problem is solved via quasilinearization. Numerical results for both problems using the IBM 360/91 digital computer are presented. Conclusions and recommendations for further study are included. (Bell-Cornell)

Available from the National Technical Information Service, Springfield, Va 22161 as PB-234 627, $5.00 in paper copy, $2.25 in microfiche. Iowa Water Resources Research Institute, Ames, Report ISWRRI-50, October 1, 1973. 142 p. OWRR A-033-IA(1).

Descriptors: *Institutions, *Local governments, *State governments, *Administration, *Management, *River Basin Commissions, *Comprehensive planning, *Interstate Commissions, *Optimal development plans, *Alternate planning, Institutional constraints, Organizations, Land management, Interstate compacts, Water districts, Land use, Administrative agencies, Governmental interrelations, Water law.

The types of state water management agencies at the state and local level and the functions of these agencies are examined. State agencies have dominated the planning and regulatory activities, whereas the local agencies, such as city and county governments and special-purpose districts, have controlled project construction and operation activities. The problems of water resource management at the local level are examined. River basin management is explored by studying the problems of existing river basin agencies which result from the lack of a comprehensive, coordinated national plan. The strengths and weaknesses of past attempts at comprehensive river basin management are evaluated. Factors influencing the operational efficiency of comprehensive management institutions on the physical dimension of the area are discussed, and the viability of an optimal hydrologic solution in light of existing social, economic and political realities is examined. Alternative state institutional arrangements discussed include the consolidation of existing state agencies into an 'environmental superdepartment,' the addition of a state coordination council to the existing arrangement, and the formation of a state department of natural resources with a division of water resource management. Emphasis is placed on the need for coordination of land-use management with water management in an institutional arrangement. Local reorganization alternatives include a freeze of existing arrangements, the dissolution of special districts and assumption of their powers by county governments, and the creation of comprehensive water districts throughout the state on a river basin basis. Interstate reorganization of River Basin Commissions and compacts is recommended to encourage state participation in interstate water management only after the state institutions are reformed to phase out local districts and create a system of state natural resource districts.

DICIAL REVIEW OF ADMINISTRATIVE ECISIONS UNDER THE NATIONAL EN-RONMENTAL POLICY ACT OF 1969,
C. Geer.
nd and Water Law Review, Vol 9, No 1, p 145-7, 1974. 143 ref.

escriptors: *Legislation, *Judicial decisions, ederal project policy, Environmental effects, deral jurisdiction, Administrative agencies.
entifiers: *National Environmental Policy Act EPA), *Environmental Impact Statements.

e National Environmental Policy Act of 1969 EPA) was a congressional attempt to force all deral agencies to take note of the surrounding vironment and to provide for its protection. The cent flood of NEPA cases coming before the deral courts arises from the willingness of these urts to grant standing to sue to private citizens d environmental protection organizations. The preme Court has held that in general the estion of standing depends upon whether the rson has shown a 'personal stake in the outcome the controversy'. The decisions of federal agen-s made under NEPA are generally reviewable the federal courts. Both the agency's decision to whether the requirements of NEPA apply to e proposed project, and an analysis of the sub-ntive environmental factors actually taken into count are reviewable by the courts. In examin-g an agency's determination of the applicability NEPA and an agency's investigation of en-ronmental effects, the courts have applied vari-s standards at juducial review. (Ritchie-Florida)

HE ECONOMIC ZONE IN THE LAW OF THE A: SURVEY, ANALYSIS AND APPRAISAL F CURRENT TRENDS,
ode Island, Univ., Kingston. Law of the Sea st.
Johnston, and E. Gold.
ccasional Paper No 17, June 1973. 53 p, 4 tab, 49 f, append.

escriptors: *Law of the sea, *International law, ceans, Navigation, International waters, Trea-s.

n economic zone proposal establishes an exten-ve maritime zone beyond the twelve mile terri-rial limits within which a coastal state would ex-cise national jurisdiction, in the form of exclu-ve or preferential rights with sole or special sponsibility, for resources and related activities. ne concept evolved from the practice of Latin-merican states' extending their maritime ju-sdiction 200 miles from their coasts. The concept s been embraced by developing nations in both atin-America and Africa. The first two Law of e Sea Conferences have seen proposals for onomic zones ignored. A third Law of the Sea onference has been called, and it is predicted at this time the status quo will not be maintained. ne evolution of the economic zone concept and ree current proposals are discussed. The con-rees are analyzed to determine the diplomatic asibility of the economic zone proposal. It is ncluded that a trend toward the acceptance of onomic zones exists which will not be reversed the Third U.N. Conference on the Law of the a. (Craig-Florida)

OORHEAD BAYOU WATERSHED, SUN-LOWER COUNTY, MISSISSIPPI (FINAL EN-IRONMENTAL IMPACT STATEMENT).
il Conservation Service, Jackson, Miss.
vailable from National Technical Information ervice as EIS-MS-73-0905-F. May 1973. 43 p, 1 b, 2 map.

Descriptors: *Channel improvement, *Watershed management, *Watershed Protection and Flood Prevention Act, Channel erosion, Flood protection, Sedimentation.
Identifiers: *Environmental Impact Statements, *National Environmental Policy Act, *Moorhead Bayou, Miss.

This watershed project located in Sunflower County, Mississippi, involves conservation land treatment supplemented by channelization of forty miles of existing multiple purpose waterways to enhance watershed protection, flood prevention and agricultural water management. The area is dependent upon farming and related industries but the land is underproductive due to poor drainage. Erosion, sediment production and flood water damages would be significantly reduced by the project. Row crop and pasturelands will be more efficiently utilized. Approximately 230 acres of woodland will be lost along the channel banks but the economy of the area would be strengthened by providing additional employment. The turbidity of water will temporarily increase due to sediment disturbance during construction. The suggested alternatives, no action, less intensive use of the land, and conservation land treatment alone, would not be as economically desirable. The project is compatible with current and projected uses of the watershed in the county. The land required for installation of the project, labor and materials will be irretrievably committed. Comments were received by local, state and federal agencies. (Dillingham-Florida)

ENVIRONMENTAL DEFENSE FUND V. FROEHLKE (RESTRAINING ORDER UNDER NEPA).
348 F. Supp. 338-367 (W.D. Mo. 1972). 29 p.

Descriptors: *Judicial decisions, *Missouri, Dams, Reservoir construction.
Identifiers: *National Environmental Policy Act (NEPA), *Environmental Impact Statements.

Plaintiff Environmental Defense Fund brought action for declaratory judgment and an injunction restraining defendant Army Corps of Engineers from completing construction on a reservoir project and dam until an environmental impact statement (EIS) was completed and filed. The District Court held that since there would be no environmental impact from the mere construction but only from the actual operation of the dam, an injunction against the continuing building should not issue. The Corps stated that the EIS would be forthcoming prior to any closing of the dam. The plaintiff's contention that the National Environmental Policy Act (NEPA) requirement for an EIS mandated total and complete work stoppage was rejected. The court instead held that although the defendants were not in complete compliance with the NEPA, nevertheless an injunction should not issue automatically without consideration of all circumstances. In this case the disadvantages of a complete work stoppage in terms of contracts and economic damages were to be considered. Since the EIS was to be available prior to the closure of the dam, and since great economic harm would necessarily result, the plea for injunction was refused. The court did, however, retain jurisdiction over the issue should plaintiffs require a prompt remedy for questioning the sufficiency of the EIS, once published. (Salley-Florida)

CLAIMS TO THE OCEAN,
H. Rotkirch.
Environment, Vol 16, No 5, p 34-41, June, 1974. 7 fig.

Descriptors: *Law of the sea, *International law, *Oceans, *United Nations, Treaties, Continental shelf.
Identifiers: Law of the Seas Conference.

The United Nations will convene the third Law of the Sea Conference in June of 1974 in Caracas, Venezuela. The outcome of this conference will affect various users of the sea and its resources. Some of the main problems which will be raised at the upcoming conference are analyzed. The chief difficulty facing the conference is the diversity of interest groups involved. This diversity of interests is complicated by the fact that a single state may simultaneously represent several interests. One of the most important questions to be resolved is the extent a coastal nation may extend its jurisdiction. Another important question concerns a nation's right to limit freedom of passage. Closely related to this question is the preservation of the marine environment. Possible solutions to these problems are presented. (Gragg-Florida)
W74-11147

GULF OIL CORP. V. STATE MINERAL BOARD, ET AL. (ACTION ON MINERAL AND WATER BOTTOM RIGHTS).
291 So.2d 807 (La. App. 1974).

Descriptors: *Louisiana, *Judicial decisions, *Navigable waters, Gulf of Mexico, Oil.

Plaintiff seeks a declaratory judgment to quiet title to ownership of water bottoms against claims by Louisiana's State Mineral Board. The Mineral Board asserts that title to the bottoms vested in the state since 1910 when a statute forbade sale of such lands. Thus, plaintiff's claim of title is fatally defective. The court held that any sale of water bottoms was a nullity, as contrary to state law. Title had thus never been transferred from the state. The fact that plaintiffs and their ancestors-in-title had paid taxes on the land for six years did not stop the state from asserting its claim of right. Since the bottoms constituted a part of water bottom of a navigable body of water, the Gulf of Mexico, the sale of that land was a nullity and any royalties accruing to the owner of the land belong to the state. The Board of Commissioners had no authority to convey state bottom land, and the chain of title was irremediably faulty based on that defect. The court found the issues here were nearly identical to an earlier case, Winkler v. State, and that the holding of that case was dispositive. In Winkler the state's ownership of water bottoms, regardless of title in private claimants, was inalienable. A similar holding applied in this case. (Salley-Florida)
W74-11148

WATERS AND WATERCOURSES---LIABILITY FOR DIKING FLOODWATERS: REJECTION OF THE 'COMMON ENEMY' DOCTRINE.
Wash. Law Rev. Vol 44, p 516-522 1969. 30 ref.

Descriptors: *Washington, *Dikes, *Diversion structures, Flood plains, Flood plain zoning, Flood routing.
Identifiers: *Common enemy rule.

Construction of dikes to retain floodwaters within the confines of a river channel is an interference with the natural flow of the stream, and liability will result for damages caused by this interference. Washington courts had for many years followed the 'common enemy' doctrine. The doctrine states that naturally occurring precipitation and runoff is an outlaw which anyone can protect against, even though injury may result to others. Flood waters were held to be surface waters, but they could not be diverted out of a defined flood channel without incurring liability for damages. Any building of a dike, or deepening of a channel, which makes previously innocuous floods become the agent of erosion or damages property may create liability. Properties receiving benefits from flood control projects should carry the burden of property losses incurred in achieving those benefits. The technical and financial capacities of flood control projects have greatly increased and are now able to bear the economic costs they impose on others.

Possible alternatives to flood control structures, such as flood plain zoning, have negated the desirability of flood control projects if they are economically unsound. (Sperling-Florida)
W74-11149

A BILL TO PROVIDE FOR A FEDERAL ECOLOGICAL PRESERVE.
House Bill 3177, 93rd Cong, 1st Sess, 1973. 8 p.

Descriptors: *Continental shelf, *Offshore platforms, Oil wastes, Oil industry.
Identifiers: Coastal zone management.

This bill seeks to preserve a portion of the Outer Continental Shelf in the Santa Barbara Channel by providing for a moratorium on drilling operations. The moratorium would last until the ability to control and prevent pollution by oil discharges is improved and would be accomplished by labeling this area an ecological preserve. Offshore oil and gas production poses a serious threat of pollution of coastal waters. Present drilling and production methods and unsightly drilling rigs constitute an environmental and navigational hazard. The need for energy resources must be weighed against the need to develop the environment. All previous rights in leases issued pursuant to the Outer Continental Shelf Lands Act will be terminated, and the United States is vested with all rights in such leases. The holder of these leases is expressly authorized to bring an action for just compensation. A special account in the Treasury is specified to pay for these Santa Barbara leases and also what monies will go into the account. The suspension of drilling will last a maximum of five years. With the Secretary of the Interior's permission, the period can be shortened if the criteria previously outlined are satisfied. (Sperling-Florida)
W74-11150

WEBSTER V. ASKEW (ACTION TO ABATE ARMY CORPS ORDER TO CEASE LAND DEVELOPMENT).
371 F. Supp. 733 (N.D. Fla. 1973). 4 p.

Descriptors: *Florida, *Judicial decisions, Land use, Rivers and Harbors Act.

Plaintiff, a land developer, brought suit against the State of Florida and the Army Corps of Engineers. Plaintiff sought injunctive, declaratory, and monetary relief from a cease and desist order which served as notice of possible criminal sanctions for violations of the Rivers and Harbors Act. The plaintiff contended that the order was a tortious interference with his right to the use of his land. Defendants moved to dismiss the complaint on the grounds that the cease and desist order merely served as notice of an ongoing investigation and did not represent a final action by any agency. Since plaintiff had failed to exhaust his administrative remedies, the 'case and controversy' requirement for standing to sue was absent. The court sustained the motion to dismiss, holding that the court would have been required to postulate what the outcome of plaintiff's case would have been if he had followed the usual procedures of appeals and hearings at the agency level. This guesswork precluded a concrete and ripe controversy. Until all available administrative remedies were exhausted, a court hearing would be premature. (Salley-Florida)
W74-11151

BONELLI CATTLE COMPANY V. STATE OF ARIZONA (ACTION BROUGHT BY RIPARIAN OWNER TO QUIET TITLE TO LAND WHICH WAS ONCE SUBMERGED UNDER COLORADO RIVER).
94 S. Ct. 517 (1973). 14 p.

Descriptors: *Accretion(Legal aspects), *Arizona, *Submerged Lands Act, *Riparian rights, Riparian land, Colorado River.

Petitioner Bonelli brought an action to quiet title for lands exposed when a federal project on the Colorado River caused a shift in the river's course. Appellant State of Arizona contends that title remains vested in the State under either the equal footing doctrine or the Submerged Lands Act. Lower Arizona State courts found for Bonelli, but the Arizona Supreme Court held that title vested in the State. Petitioner appealed to the U.S. Supreme Court which held that under the equal footing doctrine states hold title to submerged lands to serve public purpose of maintenance of navigability, that once the waters receded that public purpose ended, and title to the land vests in the riparian owner as the newly exposed land represents an accretion. In effect, the State holds a fee on submerged lands that is defeasible on the event of a shift in the river course. Granting to the states of title to submerged lands was not intended as a windfall to the states, but rather as an implementation of the state's interest in preserving the public's access to navigable waters. Once that purpose is ended by a change in the river's course the public interest ends, and the common law concept of accretion controls. Since accretions vest in the riparian owner, petitioner's plea for quiet title must be honored. (Salley-Florida)
W74-11152

A BILL TO AMEND THE WILD AND SCENIC RIVERS ACT OF 1968.
House Bill 4326, 93rd Cong, 1st Sess, 1973. 2 p.

Descriptors: *Wild rivers, *California.
Identifiers: *Wild and Scenic Rivers Act of 1968, *American River.

This bill, provides that the Wild and Scenic Rivers Act of 1968 be amended by designating a portion of the American River in California, for potential addition to the national wild and scenic rivers system. The proposed amendment calls for Section 5, subsection (a) of the Wild and Scenic Rivers Act to include the North Fork of the American River from Cedars to Auburn Reservoir. The act also authorizes a study to be conducted by the Secretary of the Interior in accordance with provisions of the Wild and Scenic Rivers Act. The bill also designates both the completion date of the study and submission date to the President and the Congress. (Proctor-Florida)
W74-11154

DAMAGES FROM POLLUTION OF AIR AND OF SURFACE AND SUBTERRANEAN WATERS,
J. B. Anderson.
Idaho Law Review, Vol 10, No 1, p 1-26, Fall 1973. 111 ref.

Descriptors: *Penalties(Legal), Judicial decisions.
Identifiers: Injunctions.

The measure of damages resulting from pollution of air and both surface and ground waters is discussed. The analysis is based on Idaho cases. It is first necessary to determine whether the injury complained of is permanent in the legal sense or merely temporary, or recurrent. A different measure of damages applies to each. The analysis can be divided into damage to real property, personal property and to crops, trees and shrubs. The Idaho cases involve apportionment of damages between independent tort-feasors. Although there is a dearth of pollution cases in Idaho, the measure of damages is substantially the same regardless of the cause of the interference with property. (Gragg-Florida)

SPECIAL FLOOD HAZARD INFORMATION REPORT, OCHLOCKONEE RIVER, FLORIDA, LAKE TALQUIN TO ALLEN LANDING.
Army Engineer District, Mobile, Ala.
November, 1971. 7 p, 1 tab, 12 plate.

Descriptors: *Reservoir operation, *Flood control, *Florida, Multiple purpose reservoirs, Flood plains.

Ownership of Jackson Bluff Dam and reservoir, Lake Talquin, on the Ochlockonee River in Leon and Gadsden Counties, Florida, has been transferred by the Florida Power Company to the State of Florida. The Division of Recreation and Parks of the Florida Department of Natural Resources assumed operation of the facility on June 1, 1971. The Department of Natural Resources requested a report on the flood probability for Ochlockonee River for the purpose of providing information and guidance for developing the flood plain. Rainfall reports from the National Weather Service and basin and river stage reports from the Geological Survey gauge at Bloxham, Florida, are used by the River Forecast Center at Atlanta, Georgia, to prepare flood predictions. The flood season is generally in the winter and spring. The flood plain is wide and very flat. Major natural floods occurred in the spring of 1948 and early fall of 1969. A dam failure in early fall in 1957 created flood conditions. The facility will be maintained for recreational purposes, and in addition programs for flood plain management have been instituted. e to increased awareness of the environmental
ation by the public, it has grown increasingly
ficult to undertake massive new airport con-
uction on land. As a result, a number of
shore airports have been proposed or are under
struction in the coastal areas of the United
tes. Some reasons that offshore airports
nimize environmental impact are: closeness to
jor metropolitan centers; buffering effect of the
ter barrier between the disagreeable features of
development and the general public; the
velopment is screened from view by the water
rier; there is a ready water supply for cooling
waste dispersion; and, in some cases
laimed land is actually cheaper than existing
shore land. Related types of developments that
y find it desirable to locate in an offshore
ting include power plants, deep draft ports,
vage treatment plants, desalination plants, ex-
ctive industries, meat packing plants, steel
ls, founderies and metal processing industries,
neries, solid waste disposal plants, and com-
nication systems industries. The basic methods
relamation are earth fill, poldering, pile support,
floating structures. A discussion of ongoing
jects and costs is included. (Shaffer-FIRL)

scriptors: *Heated water, *Water cooling,
oasts, *Offshore platforms, Cooling towers,
clear powerplants, Electric powerplants, Elec-
power production.

anel discussion on policy for location of power
nts in coastal areas was held in Charleston, S.C.
stimony was presented by experts representing
ee interests: the environmentalists', the utility
npany, and the U.S. Atomic Energy Commis-
n. Each member of the discussion recognized
need to increase production of electricity. The
el members recommended the following poli-
cies regarding location of power plants in coastal areas be implemented: identify and inventory the critical areas concerned; identify and obtain site approval for electrical power; and begin implementation of a public education program. Most power plants should not be sited in areas of critical environmental concern and must use modified intake and discharge structures to minimize entrainment. Power plants may be located offshore when the appropriate health and safety requirements are met. Differences in design and operation of power plants are necessary to insure that the specialized requirements of the marine and estuarine areas are satisfied. (Craig-Florida)

Descriptors: *Analytical techniques, *Filtration, Properties, *Rheology, *Flow, Laminar flow, Turbulent flow, Viscosity, Velocity, Pressure, Stress, Porous media, Capillary action, Curves, Equations.
Identifiers: USSR.

Correct experimental conditions for investigations of nonlinear filtration effects and rheological properties of a fluid are described. Modeling of a real porous body by cylindrical capillaries of similar or varying cross-section and disregard for processes of relaxation of a fluid structure are incorrect whenever studies are made of the character of nonlinear filtration effects and of the rheology of a moving fluid. To successfully conduct investigations, stability of filtration flow through time should be rigorously maintained, and possible development of osmotic effects and boundary-layer movement should be controlled. A rheological curve of structured fluids and velocity variation during transition from laminar to turbulent flow are diagrammed. (Josefson-USGS)

CTD SENSORS, SPECIFIC CONDUCTANCE AND THE DETERMINATION OF SALINITY,
North Carolina State Univ., Raleigh. Inst. of Marine Sciences.
C. E. Knowles.
Available from NTIS, Springfield, Va. 22161 as COM-73-11690, Price $3.00 printed copy; $2.25 microfiche. Sea Grant Publication 73-16 (North Carolina Center for Marine and Coastal Studies Report No 73-3), August 1973. 14 p, 5 tab, 10 ref. NOAA Grants 2-35178 and 04-3-158-40.

Descriptors: *Salinity, *Sea water, *Electrical conductance, Water temperature, On-site tests, Data collections.
Identifiers: *Specific conductance.

To convert the specific conductance measured by a conductivity-temperature-depth sensor to salinity it is necessary to establish a means of estimating the specific conductance of seawater having a salinity of 3.5%. Third order polynomial expressions were formulated for one Red Sea Water and two Normal Water samples, each having a salinity of 3.5%. (Knapp-USGS)

R. Kolmel.
Marine Biology, Vol 25, No 2, p 163-168, 1974. 6 fig, 13 ref.

Descriptors: *Sediments, *Sampling, Technology, Bottom sampling, Assay, Benthos.
Identifiers: Meiofauna, Quantitative sampling.

A new method has been developed to obtain meiofauna samples from very soft and muddy sediments with high organic and water contents. The construction of the new instrument is described. It consists of a bottomless plexiglass box, the cover and front of which are easily removable. It does not cause compression of the sampled sediment, and hardly disturbs it. The semi-liquid surface of the sediment is kept in place by the use of a 'sledge' and a strip of tape inside the sampler. (Katz)

WATER DATA -- A NEW AWARENESS,
Geological Survey, Reston, Va.
W. W. Doyel.
Water Resources Bulletin, Vol 10, No 4, p 710-718, August 1974. 13 ref.

Descriptors: *Hydrologic data, *Data collections, *Data storage and retrieval, *Information exchange, *Data processing, Basic data collections, Computers, Data transmission, Networks, Automation, Water management(Applied).
Identifiers: *Water data.

One of the most significant changes in the field of hydrology in the past few years has been the increase in demand for basic data resulting from new awareness on the part of planners, developers

and managers of the essential nature of such data. For many years data collection has been an onerous, routine operation, following which the data were processed and stored - either in publications or file drawers - and the job considered completed. Two developments have changed that picture: the realization that we are drastically altering the environment, and the advent of the computer. The first forced a recognition of the need for accurate basic data and the second provided a new methodology for handling and using it. The change is evidenced in many ways and numerous activities are underway at both State and Federal level for all facets of the acquisition and handling of water data. The collection of basic data still involves hard routine work and a conscientious effort to maintain a high level of quality. Hopefully, recognition of the absolutely essential nature of an adequate data base will result in the continued enhancement of the basic-data collector and the concomitant increase in support of his activities. RIVER MILE INDEX, SEVIER LAKE BASIN, UTAH AND MINOR BASINS IN WESTERN UTAH AND EASTERN NEVADA.
Forest Service (USDA), Ogden, Utah. Intermountain Region.
Pacific Southwest Interagency Committee River Mile Index Report, June 1974. 41 p.

Descriptors: *Rivers, *Southwest US, Surveys, Maps, *Utah, *Nevada, River basins.
Identifiers: *River mile index, *Sevier Lake Basin(UT).

This river mile index for the Sevier Lake basin and minor streams in western Utah and eastern Nevada is one of a series of reports for stream basins in the Pacific Southwest. River mileages were determined from independent measurements made on U.S. Forest Service planimetric maps or U.S. Geological Survey topographical quadrangles. River mile distances were measured upstream from the mouth to the nearest tenth mile. Tributaries are shown as entering from the right or left from a position facing downstream. Streams and points of interest are based on the volume of flow, size of drainage, and degree of development. (Knapp-USGS)

HYDROLOGIC DATA FOR MOUNTAIN CREEK, TRINITY RIVER BASIN, TEXAS, 1972,
Geological Survey, Austin, Tex.
H. D. Buckner.
Open-file report, May 1974. 13 p, 1 fig.

Descriptors: *Basic data collections, *Rainfall-runoff relationships, *Small watersheds, *Texas, *Water yield, Data collections, Hydrologic data, Hydrographs, Discharge(Water).
Identifiers: Mountain Creek(TX), *Trinity River basin(TX).

Records of streamflow and reservoir content of Mountain Creek, Texas for the year are given in a form which facilitates their use in detailed analyses of the hydrologic system. This report covers the 1972 water year. The stream-gaging stations on Mountain Creek near Cedar Hill and Walnut Creek near Mansfield provide hydrologic data to define runoff characteristics from small drainage basins. They also serve as index stations for inflow into the reservoir and provide operational data for the reservoir. In addition, the station Walnut Creek near Mansfield is equipped with a recording rain gage. The stage station near Duncanville provides data pertinent to operation of the gates in the Mountain Creek Lake Dam. The reservoir-content station at the dam provides records of reservoir stage and contents. The stream-gaging station Mountain Creek at Grand Prairie provides records of outflow from Mountain Creek Lake and the basin. (Knapp-USGS
W74-11441

HYDROLOGIC DATA FOR PIN OAK CREEK, TRINITY RIVER BASIN TEXAS, 1972,
Geological Survey, Austin, Tex.
B. B. Hampton.
Open-file report, May 1974. 26 p, 2 fig, 3 tab.

Descriptors: *Basic data collections, *Rainfall-runoff relationships, *Small watersheds, *Texas, Data collections, Hydrologic data, Hydrographs, Sediment load, Discharge(Water), Water resources development.
Identifiers: Pin Oak Creek(TX), *Trinity River basin(TX).

This report, which is the thirteenth in a series of basic-data reports published annually for the Pin Oak Creek study area in Texas, contains the rainfall and runoff data collected during the 1972 water year for the 17.6-square-mile area above the stream-gaging station Pin Oak Creek near Hubbard, Texas. The locations of floodwater-retarding structures (ungaged) and hydrologic-instrument installations in the Pin Oak Creek study area are shown. The records collected before watershed development (1956-65) and after complete watershed development (1965-72) are to be used in the analyses of rainfall-runoff relationships. Four recording and two nonrecording rain gages are located in the study area to determine the amount and intensity of rainfall. The rain gages were located to give the best geometric coverage of the study area. Basin rainfall is computed as the arithmetic average of the six gages. Daily rainfall observed at the nonrecording gages is distributed to storm periods on the recorded rainfall. The stream-gaging station, Pin Oak Creek near Hubbard, continuously records the stage, which together with measurements of streamflow are used to compute runoff from the study area. (Knapp-USGS)

RECOMMENDATIONS FOR INSTALLING PVC GRAVITY SEWER PIPING,
Plastics Pipe Inst., New York.
R. Durazo.
Public Works, Vol 105, No 4, p 80-81, April, 1974. 2 fig.

Descriptors: Pipes, Engineering structures, *Sewers, *Plastic pipes, *Pipe foundations.
Identifiers: PVC pipes.

Procedures are described for installing PVC sewer pipe to get the best results. The pipe should be bedded true to line and grade with uniform and continuous support from a firm base. Blocking should not be used to bring the pipe to grade. Lateral restraint should be provided by properly placed and compacted backfill material. Appropriate material should be used for bedding, haunching, and initial backfilling. In addition, care should be taken during excavation to provide as narrow a trench as practical at a point level with the top of the pipe. Well points or underdrains may be required when excavating below ground water level. USCS Soil Classification System (FHA Bulletin No. 373) is described, and haunching and initial backfill procedures during various conditions and for the various soil classifications are described. (Murphy-FIRL)

EPOXY TAR LINES BIRMINGHAM'S TRUNK,
D. Hayward.
New Civil Engineer, p 40-41, January 31, 1974. 3 fig.

Descriptors: *Sewers, *Tunnels, *Linings, Engineering structures, Concrete pipes, *Epoxy resins, Protective coatings.
Identifiers: Epoxy tar, Glass fiber, *United Kingdom(Birmingham).

To deal with the problem of chemical attack and corrosion, Birmingham, England, is trying a new method of coating the inside of its sewer tunnel's smooth precast concrete lining with epoxy tar. The coating was developed by Spun Concrete and consists of fiber glass tissue sandwiched between two layers of epoxy tar. The fiber glass is for strength and abrasion resistance. A trowel is used to apply the coating. The 35 percent increase in cost will be offset by reduced maintenance and replacement. The tunnel is 1.5 meters in diameter and runs through rock riddled with coal seams, ironstone and fireclay. The coal seams had been worked and were open or filled with debris, presenting the danger of local subsidence. To accommodate this probable eventuality flexible pipes and linings were used (Flexilok - Extraflex segments made by Spun Concrete). The epoxy coating survived the construction process well. HYDRAULIC PERFORMANCE OF PENNSYLVANIA HIGHWAY DRAINAGE INLETS INSTALLED IN PAVED CHANNELS,
Lehigh Univ., Bethlehem, Pa. Dept. of Civil Engineering.
P. P. Yee, W. H. Graf, and A. W. Brune.
Available from NTIS, Springfield, Va 22161 as PB-222 488, Price $6.25 printed copy; $2.25 microfiche. Office of Research, Fritz Engineering Laboratory Interim Report 364-3, November 1972. 74 p, 23 fig, 8 tab, 11 ref, 2 append. Penn DOT 68-31.

Descriptors: *Intakes, *Drainage systems, *Road design, *Pennsylvania, Hydraulics, Hydraulic models, Design, Highways, Open channel flow, Runoff, Storm runoff.
Identifiers: *Drainage inlets.

The capacities of three different standard inlets gratings installed in paved channels by the Pennsylvania Department of Transportation were determined in a paved drainage channel equipped with adjustable slopes. The longitudinal slope ranged from 0.5% to 8%; one side slope ranged from 48:1 to 12:1; and the other slope was at an inclination of either 3:1 or 1/8:1. The drainage inlets studied were Type J Inlet, Type 4-Ft. Special Inlet, and Type 6-Ft. Special Inlet. Model inlets were built to half the scale of the actual inlets. Each inlet was tested under a variety of channel configurations and of channel flow rates. The capacity of an inlet was determined by actual measurements, and the efficiency of each inlet was obtained. A series of curves, relating efficiency to capacity for an inlet, are presented. The curves show that as more water flows in the channel toward an inlet the efficiency of the inlet decreased. (Knapp-USGS)

SMOKE TESTING PINPOINTS SURFACE WATER INFLOW,
Superior Signal Co., Spotswood, N.J.
F. M. Nichols.
Deeds and Data (Water Pollution Control Federation), p D2, D6, June 1974.

Descriptors: *Treatment facilities, *Pipelines, *Engineering structures, *Surface waters, *Conduits, *Smoke, *Sewerage, *Hydraulic structures, *Aquifer testing, *Testing procedures, *Leakage, *Seepage control, *Infiltration, Rainfall, Operation and maintenance, Runoff, Subsurface runoff.
Identifiers: Smoke tests(For pipe openings), Defects.

Openings that allow surface water inflow are the principal cause of the overloading of waste water treatment plants and collection systems during a rainfall. Blowing a large volume of air mixed with smoke into the system is an economic and rapid way for locating such openings in sewage mains, laterals, and even house plumbing simultaneously regardless of pipe diameter. The cost of smoke testing is only a few cents per foot, including labor, equipment, and materials. Operating techniques of this method are outlined, and two illustrative case histories are cited. Smoke tests may reveal infiltration sources that are easily missed by other procedures, including camera surveys. They are also effective for acceptance inspection of new lines, if done within 72hr of backfilling before soil compaction. One or two sections of a main may be tested within 5-10min, much faster than other line testing methods. (Brown-IPC)

STEEL PIPELINE DESIGN,
Crest Engineering Co., Tulsa, Okla.
R. C. Hughes, W. R. DeKeyser, L. L. Elder, and G. R. Wilson.
Civil Engineering-American Society of Civil Engineers, Vol 44, No 3, p 64-67, March, 1974. 1 fig.

Descriptors: *Pipelines, *Design criteria, Standards, *Slurries, Temperature, Fluid temperature, *Corrosion control, Pressure, Structures, Engineering structures, Communication, Research.
Identifiers: *Steel pipelines, *Liquid petroleum, Water pipelines, Stress.

Design criteria differ for steel pipelines used for slurry, liquid petroleum, gas, and water. Experts in each area discuss differences between them. Slurry pipeline design refers to long distance transportation of a designed slurry; both liquid and solid stresses are discussed. Corrosion/erosion resistant linings are essential for reducing required wall thickness. For liquid petroleum pipelines, criteria for internal and external pressures defined in various codes and standards are the minimum requirements rather than the limits for the engineer. Factors to be considered in design are temperature, fluid temperature, dynamic effects, longitudinal stress, corrosion, threading and grooving, and wall thickness and defect tolerances. Gas pipelines follow similar criteria, with additional limitations due to possible internal corrosion. The discussion of water pipelines includes those buried for water supply and transmission pipelines with pipe in diameters 24 inches and larger. Internal pressures, external loads and protective lining and coatings, cathodic protection, and types of field joints are described. Standardized symbols in coding as well as communication between en

ineers in these subfields were deemed necessary.

escriptors: *Surveys, *Surveying instruments, Measurement, Light, Optical properties, Physics, ench marks, *Instrumentation, Refractivity.
lentifiers: *Lasers.

he forces and influences that act upon a precise rveying system were studied to attempt to entify the cause of detrimental influences and to vestigate the feasibility of minimizing these in-uences in practical applications. The effects of mperature, pressure, humidity, wind, and fog on ght paths were determined. The effects of eleva-on on survey lines, length of line, and laser out-it were also studied. In dam galleries, horizontal onuments in the form of stainless steel plates ould be grouted permanently into the gallery alls, to serve as precise survey positions, and as pports for instrument brackets, lateral ad-stors, and surveying instruments. Prior to and ring surveys, care should be taken to minimize e flow of air through the gallery from dif-rentially heated sources. To minimize the effect differential heating of the concrete, survey lines ould be at least 12 in. from the gallery walls. In ew dams, survey lines should be established mid-ay between gallery walls so that the effect of ydration heat will be equalized. During the sur-ey, personnel should stand at least 16 in. from the rvey line so that body heat does not create air mperature anomalies that may distort the survey ne. Survey lines should be located in regions of inimum air mixing. (Knapp-USGS)

ETHOD OF TREATING SUBTERRANEAN ORMATION TO IMPROVE PERMEABILITY,
exaco, Inc., New York.
. B. Thigpen, Jr., and J. F. Tate.
.S. Patent 3,807,500. Issued April 30, 1974. Offi-al Gazette of the U.S. Patent Office, Vol 921, No p 1893-1894, April 30, 1974. 1 fig.

Descriptors: *Patents, *Aquifer management, *Permeability, *Subsurface drainage, *Artificial recharge, Infiltration, Clays.

A method is described for treating subterranean formations containing water sensitive clays which have sustained permeability damage due to contact with fresh water. To increase the permeability of the subterranean formations a solution of potassium chloride is injected into the formation via wells drilled into the formations. Treatment with a heated fluid including steam having a temperature of at least 300F for several hours follows. The formation is then further treated with mud acid or retarded mud acid. (Murphy-FIRL)

APPLICATION HYDROLOGIC AND HYDRAULIC RESEARCH TO CULVERT SELECTION IN MONTANA--VOL II, APPENDICES,
Montana State Univ., Bozeman. Dept. of Civil Engineering and Engineering Mechanics.
E. R. Dodge.
Available from NTIS, Springfield, Va. 22161 as PB-220 094, Price $3.00 printed copy; $2.25 microfiche. Final Report to Montana Department of Highways Planning and Research Bureau, September 15, 1972. 141 p, 5 append.

Descriptors: *Design flow, *Culverts, *Montana, Regression analysis, Frequency analysis, Flood frequency, Peak discharge, Flood forecasting, Streamflow forecasting, Hydraulics.

A regional frequency analysis was performed, involving both natural and synthetic streamflow records, to estimate flood magnitude of various recurrence intervals for each of 230 Montana Watersheds. Using regression analysis, flood peak prediction equations for the 2, 5, 10, 25 and 50 year recurrence intervals were developed for each of 9 contiguous geographic regions in Montana. These equations predict the flood peak as the product of powers of various hydrologic watershed parameters. (Knapp-USGS)
W74-11022

LONG WAVE EXCITATION IN HARBOURS--AN ANALYTICAL STUDY,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
U. Unluata, and C. C. Mei.
Available from NTIS, Springfield, Va. 22161 as AD-770 842, Price $6.50 printed copy; $2.25 microfiche. Ralph M. Parsons Laboratory for Water Resources and Hydrodynamics, Technical Report No 171, October 1973. 284p, 48 fig, 24 ref, 5 append. Navy Contract N00014-67-A-024-0036.

Descriptors: *Waves(Water), *Surges, *Seiches, *Harbors, Hydraulics, Wind tides, Mathematical studies, Winds, Resonance.

Harbor oscillations were studied analytically. Ignoring real fluid effects, the method of matched asymptotics was utilized by assuming that the large bodies of water in a harbor system communicate with each other through junctions of much smaller dimensions. In the neighborhood of a junction, the flow is approximated by a potential flow whereas in the greater part of the fluid, the junction can be represented by a source or a sink. The finite length of a short junction can be incorporated with the width to define an effective width, thereby enabling previous results for a gap in a thin breakwater to be extended. For a long and narrow bay the position of a partitioning breakwater with a gap is important for general modes. Improper positioning may adversely affect the inner bay. For a harbor with two coupled basins of equal size, the proliferation of resonant peaks is important. The effect of a river at the back of a harbor basin was also studied. Due to additional energy radiation, the response is in general less severe than the riverless harbor. (Knapp-USGS)

THE USE OF STANDARD BODIES TO MEASURE THE CAVITATION STRENGTH OF WATER,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
E. Silberman, F. R. Schiebe, and E. Mrosla.
Project Report No 141, September 1973. 49 p, 12 fig, 2 tab, 29 ref, 3 append. ONR Contract N00014-67-A-0113-0032.

Descriptors: *Cavitation, *Hydraulic models, Fluid mechanics, Bubbles, Laboratory tests.

A technique for measuring the cavitation strength of water is based on counting cavitation events as a function of cavitation number on a standard body, thereby producing cavitation characteristic curves. It is assumed that water cavitates because of nuclei carried in the water and that the measured characteristic curves must therefore be related to the nuclei which are present. It was hypothesized that the nuclei could be represented by a distribution of equivalent gas bubbles of neutral density. By calculating cavitation characteristic curves for various bubble numbers and size distributions and comparing the calculated curves with measured curves for the same body, it was possible to infer the specifications for the equivalent bubble nuclei that were present in any test. Incipient cavitation should be predictable. (Knapp-USGS)

THE RANDOM MODEL IN FLUVIAL GEOMORPHOLOGY,
Thomas J. Watson Research Center, Yorktown Heights, N.Y.
J. S. Smart.
Available from NTIS, Springfield, Va. 22161 as AD-768 040, Price $3.00 printed copy; $2.25 microfiche. Technical Report No 10, August 1973. 40 p, 7 fig, 1 tab, 33 ref. ONR Contract No N00014-70-C-0188.

Descriptors: *Geomorphology, *Statistical models, Hortons law, Stochastic processes, *Drainage patterns(Geologic), Erosion, Weathering, *Drainage density.

A statistical model of drainage basin composition is primarily based on two postulates suggested by investigations of the role of randomness in drainage network development. The postulates are: (1) the topology of channel networks is random; (2) link lengths are independent random variables drawn from a common distribution. Examples of the application of the random model in description, estimation, and explanation of drainage basin properties are given. (Knapp-USGS)
W74-11035

OFFSET BREAKWATER CONFIGURATION,
W. L. Moore.
U.S. Patent No 3,800,543, 4 p, 19 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 921, No 1, p 68, April 2, 1974.

Descriptors: *Patents, *Shore protection, *Breakwaters, Equipment, Beaches, Shores, Barriers.

A breakwater provides wave reflecting surfaces designed so that when part of the wave is reflected at one surface, another part is reflected at a surface which is displaced by approximately one-half the wavelength of the incident wave. The displacement of the reflecting surfaces serves to balance and cancel out wave forces on the structure itself and can be adjusted to correspond to the desired or expected range of incident wavelengths. VARIED FLOW FUNCTIONS FOR ELLIPTIC CHANNELS,
Iowa Univ., Iowa City. Inst. of Hydraulic Research.
O. Gueven.
Journal of Hydraulic Research. Vol 12, No 1, p 1-23, 1974. 5 fig, 8 tab, 6 ref, 1 append.

Descriptors: *Gradually varied flow, *Flow profiles, *Open channel flow, *Non-uniform flow, Flow, Channels, Hydraulics, Uniform flow, Equations, Dimensional analysis, Critical flow, Curves, Depth-area curves, Numerical analysis.
Identifiers: *Elliptic channels, Prismatic channels, Varied flow functions, Flow depth, *Nondimensional analysis, Channel geometry.

The equation of gradually varied flow is written in a suitable nondimensional form and two varied flow functions are defined. Numerical values for these functions are tabulated for elliptic channels with several different ratios of the semimajor axis to the semiminor axis. Dimensional and nondimensional flow profiles can be obtained with the aid of the two varied flow functions. Nondimensional curves are presented to aid in the calculation of uniform flow in elliptic channels. (Humphreys-ISWS)

ENERGY DISSIPATOR FOR SANTA PAULA CREEK, SANTA CLARA RIVER, CALIFORNIA, HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
J. H. Ables, Jr.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-762 540, Price $3.00 printed copy; $2.25 microfiche. Technical Report H-73-11, June 1973. 52 p, 4 fig, 20 plate, 17 photo.

Descriptors: *Energy dissipation, *Hydraulic models, *Drops(Structures), Hydraulic structures, Hydraulic jump, Hydraulics, Spillways, Open channel flow, *California.
Identifiers: *Santa Clara River(CA).

The Santa Paula energy dissipator at the confluence of Santa Paula Creek and Santa Clara River, California, reduces velocities and dissipates energy from floodflows. Since floodflows could occur in the Santa Paula Channel with little or no tailwater effect from flow in the Santa Clara River, an energy dissipator that will function satisfactorily regardless of tailwater elevation is desirable. Thus, a design with impact blocks placed throughout the structure to gradually reduce velocities and induce backwater in the channel was used. A model investigation was conducted on a 1:20-scale model reproducing a 570-ft-long by 60-ft-wide high-velocity approach channel, a 750-ft-long energy dissipator, and a 500-ft-wide schematic portion of the Santa Clara River. Tests were concerned with flow conditions in the superelevated approach immediately upstream from the energy dissipator, the optimum size and configuration of the dissipator, and stability of the riprap plan at the confluence of Santa Paula Creek and Santa Clara River. Tests revealed that flow conditions in the high-velocity channel and curve immediately upstream of the energy dissipator were satisfactory, while conditions in the original design energy dissipator were unsatisfactory. An energy dissipator was developed and resulted in satisfactory flow conditions with design discharge conditions (27,000 cfs) as well as a full range of flows. (Knapp-USGS)
W74-11210

LOCK AND DAM NO. 8, ARKANSAS RIVER NAVIGATION PROJECT, HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
J. J. Franco, and C. D. McKellar, Jr.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-763 174, Price $3.00 printed copy; $2.25 microfiche. Technical Report H-73-10, May 1973. 91 p, 4 fig, 42 plate, 2 tab.

Descriptors: *Hydraulic models, *Arkansas, *Dams, *Canals, *Locks, Dredging, Sedimentation, Navigation, Channel improvement, River training.
Identifiers: *Arkansas River.

A movable-bed model reproducing 11.0 miles of the Arkansas River, with a horizontal scale of 1:120 and a vertical scale of 1:80, was used to determine the suitability of a proposed site for a lock and dam structure, adequacy of proposed regulating works in the reach upstream and downstream of the structures and modifications required to provide adequate channel dimensions and satisfactory navigation conditions, and relative effectiveness of various sizes of dredged channels. Development of an adequate channel in the reach was affected by the natural tendency for the channel to cross toward the right bank upstream of the proposed damsite and by the tendency for the channel to meander in the long flat bend downstream of the dam. Because of these tendencies, considerable modification of the proposed training structures to provide a reasonably stable channel of adequate dimensions would be required. (Knapp-USGS)

HYDROLOGIC ENGINEERING METHODS FOR WATER RESOURCES DEVELOPMENT: VOLUME I, REQUIREMENTS AND GENERAL PROCEDURES,
Hydrologic Engineering Center, Davis, Calif.
L. R. Beard, A. J. Fredrich, and E. F. Hawkins.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-758 904, $6.00 in paper copy, $2.25 in microfiche. Report HEC-IHD-100, October 1971. 578 p, 31 ref.

Descriptors: *Hydrology, *International Hydrological Decade, *Computer programs, *Flood protection, Flood control, Reservoirs, Water supply, Hydroelectric power, Wate resources development, Hydrograph analysis, Systems analysis.
Identifiers: *Hydrologic engineering.

Hydrologic engineering methods are presented fo use in regions of sparse data. Procedures an methods are described that have been used suc cessfully in Corps of Engineers studies or are be lieved to be of significant interest. Description are presented of computer programs and man recently developed techniques for use in hydrolo ic studies. The types of water resources discusse include local flood protection, flood control b reservoirs, water supply by reservoirs, hydroele tric power developments, multipurpose reservoir and water resources systems. Three generalize computer programs covering different phases o hydrologic engineering are included. The first pr gram (HEC-1, Flood Hydrograph Package) cove most types of problems generally associated wit flood hydrograph analysis. HEC-2, Water-Surfac Profiles, is primarily concerned with investig tions related to river hydraulics problems. Th third program, HEC-3, Reservoir System Analy sis, deals with problems related to the planning design, and operation of a system of reservoirs fo conservation purposes. HYDROLOGIC ENGINEERING METHOD FOR WATER RESOURCES DEVELOPMENT VOLUME 10. PRINCIPLES OF GROUND WATER HYDROLOGY,
Hydrologic Engineering Center, Davis, Calif.
R. L. Cooley, J. F. Harsh, and D. C. Lewis.
Available from NTIS, Springfield, Va 22161 a AD-758 906, Price $6.00 printed copy; $2.2 microfiche. Report HEC-IHD-1000, Vol 10, Apr 1972. 342 p, 56 fig, 6 tab, 6 ref.

Descriptors: *Hydrogeology, *Groundwate movement, Water resources development, Finit element analysis, Computer programs, Porou media, Surface-groundwater relationships.

The fundamental concepts which govern the oc currence and movement of groundwater an described and the basic principles of hydrology geology, hydraulics, and physics as they relate t groundwater are explained. The information is su ficient to guide hydrologic engineers in th identification and initial considerations of ground water aspects of water resource development stu dies. A generalized computer program description 'Finite Element Solution of Steady-State Potenti Flow Problems,' is included. This program is in tended for application to problems involvin steady two-dimensional flow through heterogene ous, anisotropic porous media of any internal o external geometry. MARINA PROTECTIVE WAVE BREAKER,
L. C. Strawn, and V. W. Stanton, Sr.
U.S. Patent No 3,822,555, 4 p, 5 fig, 5 ref; Offici Gazette of the United States Patent Office, V 924, No 2, p 204, July 9, 1974.

Descriptors: *Patents, *Marinas, *Breakwater Equipment, Hydraulics.
Identifiers: *Wave action, *Wave breakers.

A simplified air burst wave breaker is designed f protection against wave action in Marina install tions. The air burst unit comprises a duct in t form of two vertical U portions arranged with th openings toward each other, having a common l and in which at least the bottom free leg is long than the common leg. The lower free leg provid a water inlet stem and the upper free leg provid the air burst or burp outlet stem. The U porti opens at the bottom of an air inlet connection the upper bend thereof. Air introduced into the

nlet duct displaces water to an equal extent, substantially, from the inlet stem and the common leg of the U sections until air commences to enter the bottom of the outlet stem. The weight of the water n the outlet stem is reduced below the pressure of he water in the inlet stem with the result that the mbalance in pressure increases at a rapid rate and vater rushes into the inlet stem to fill the entire levice an in so doing, abruptly expells the air reviously accumulated in a sudden gush out of he top of the outlet stem. The pressure of the air ed to the plurality of burpers forming the breakvater chain is selected to exceed the hydrostatic ressure of the water at the selected level of subnersion of the burpers. ROST PROTECTION FOR WATERLINES.
Effluent and Water Treatment Journal, Vol 14, No , p 55, January 1974.

Descriptors: *Heat treatment, *Pipes, *Frost revention.
dentifiers: *Heater strip, England.

A new approach to the problem of frost protection f water lines has been provided by the introducion of a self-limiting heater strip available from Chemelex Heat Ltd. The heater strip consists of n electrically insulated polymeric conductive elenent in contact with two electrodes which are uitable for direct connection to a power supply. The current flows from one electrode to another cross the strip in a parallel circuitry configuration uch that the heater strip can be cut to length on ite, limited only by the maximum current rating of 0 amps per circuit. The self-limiting feature in onjunction with the parallel circuitry permits the trip to be used in any circuitry layout including vrapping over itself when tracing valves and pipe ittings. Each section of the heater strip behaves ndependently of any other section and adjusts its eat output according to its local temperature, vhich will depend on the balance between heat nput and heat loss rates. These factors depend on ipe diameter, insulation grade and thickness, and ariations in ambient temperature. The heater strip nay be used on different pipe sizes in the same lectrical circuit. METHOD OF CLEARING A PATH THROUGH ICE,
Global Marine Inc., Los Angeles, Calif.
C. E. Bastian, Jr.
U.S. Patent No. 3,808,997, 5 p, 10 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 922, No 1, p 115, May 7, 1974.

Descriptors: *Patents, *Ice, *Navigation, *Ice-water interfaces, Equipment.
Identifiers: *Ice breakup.

An icebreaking arrangement is described in which air is applied under sufficient pressure to lower the surface of the water at an ice-water interface to a level below the bottom of the ice over an area which extends on either side of the interface. The unsupported weight of the ice in the region in which the water level is depressed produced failure and breaking off of pieces of ice at the interface. The increased pressure is produced by an air-tight platform having a downward extending skirt around the periphery, air under pressure being admitted to the region below the platform. The platform may be mounted on the bow of a ship or moved ahead of a ship to clear a channel through the ice. (Sinha-OEIS)

CONCRETE ARMOR UNITS FOR PROTECTION AGAINST WAVE ATTACK, REPORT OF AD HOC COMMITTEE ON ARTIFICIAL ARMOR UNITS FOR COASTAL STRUCTURES.
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-774 800, Price $4.00 printed copy; $2.25 microfiche. Miscellaneous Paper H-74-2, January 1974, R. Y. Hudson, editor. 39 p, 42 fig, 7 tab, 2 append.

Descriptors: *Coastal engineering, *Shore protection, Jetties, Breakwaters, Design, Waves(Water), Concrete structures, Design criteria, Structural shapes.

Special-shaped concrete armor units for use in the protective cover layer of rubble-mound structures exposed to storm-wave action have been developed throughout the world in the past 20 to 25 years. Quarrystone armor units may be used when available at a competitive price and when the wave conditions at the structure site are not too severe. Design information and guidance is provided for selecting the shape and size of concrete armor units for use in constructing rubble-mound structures that will be stable at a minimum cost. The factors that determine the choice of design waves are described. A stability formula and stability coefficients are given for different amounts of damage to the structure. The casting of armor units, the problems of breakage, and the legal aspects of using concrete armor units of special shape are discussed. The tetrapod, tribar, and dolos armor units should be considered for use in the design of rubble-mound breakwaters and jetties when the use of quarrystone is not feasible. The dolos armor unit is the most efficient, and procedures for the design of a typical breakwater cross section, using these armor units for the protective cover layer, are presented. (Knapp-USGS)

CONTRIBUTIONS TO THE STUDY OF STERLET (ACIPENSER RUTHENUS RUTHENUS L.) ARTIFICIAL BREEDING: II. FRY AND FINGERLING FEEDING IN BASINS WITH CIRCULAR WATER FLOW, (IN RUMANIAN),
H. Fuhrmann, E. Fuhrmann, S. Dragasanu, and A. Cristea.
Bul Cercet Piscic. Vol 31, No 1/2, p 101-122. 1972. Illus. English summary.

Descriptors: *Fry, Fish diets.

In 1971 a breeding station was set up to produce fish for stocking the Danube in the section upstream from the Iron Gates dam (Romania). This was the first opportunity for obtaining and breeding sterlet fry. Two possibilities existed to apply methods used in sturgeon feeding. Good results were obtained in feeding fry with Enchytraeidae, Artemia salina and Chironomidae. To improve fodder consumption as well as to make possible the use of chironomids too large to be eaten as such, the following mixture was employed: 30% minced chironomids, 25% chrysalid meal, 15% fish meal, 8% meat and bone meal, 2% dried yeast and 20% water. The chironomid proportion may be diminished as the fry are accustomed to the artificial food. The coagulated fresh blood with a high protein and essential amino-acid content comparable to the most important natural food elements was consumed. Fingerling growth rate is given. The inactivated zooplankton and the fresh blood serve to improve the quality of food.--Copyright 1974, Biological Abstracts, Inc.

RESTORATION OF AN OYSTER RESOURCE DESTROYED BY NATURAL CAUSES,
Alabama Dept. of Conservation and Natural Resources, Montgomery.
E. May.
Available from the National Technical Information Service, Springfield, Va 22161 as COM-73-11130, $3.00 in paper copy, $2.25 in microfiche. Completion Report NOAA-73052112, July 1972. 4 p, 1 fig.

Descriptors: *Anaerobic conditions, *Oysters, *Planting management, Fish, Shellfish, Fishkill, Dissolved oxygen, Fisheries.
Identifiers: Mobile Bay(AL).

A naturally occurring area of low dissolved oxygen concentration, discovered on August 4, 1971 in Pt. Clear Reef in Mobile Bay, Alabama resulted in a fish kill estimated at 10,588,705 fish, shrimp and crab. The anaerobic condition was not the result of water pollution as this episode has recurred in this area for more than 100 years but rarely resulted in fish kills. The August 1971 period of low oxygen in the bottom waters caused a 95% mortality of the oysters. In order to replace the lost resource, cultch material was planted in a more suitable area in the vicinity, on a portion of Whitehouse Reef. This reef had not been productive because of the lack of cultch material, however it contains a firm bottom and the area has shown no problem with low dissolved oxygen or pollution. Approximately 439 barrels of marsh clam shells were planted per acre on 253.4 acres of the area by the Alabama Department of Conservation and Natural Resources and the site is expected to yield seed oysters and commercial harvest. (Auen-Wisconsin)

CONNECTICUT RIVER ECOLOGICAL STUDY--A STUDY OF THE RATE AND PATTERN OF SHAD MIGRATION IN THE CONNECTICUT RIVER--UTILIZING SONIC TRACKING APPARATUS,
McGill Univ., Montreal (Quebec). Dept. of Biology.
W. C. Leggett, and R. A. Jones.
Available from NTIS, Springfield, Va 22161 as COM-73-11043, Price $3.00 printed copy; $2.25 microfiche. Essex Marine Laboratory Report No 5, February 1973. 118 p, 32 fig, 7 tab, 18 ref.

Descriptors: *Fish migration, *Connecticut River, Fish barriers, Connecticut, Salinity, Saline water-freshwater interfaces, Fisheries.
Identifiers: *Shad, Commercial fisheries.

The rates and patterns of movement of adult shad in the Connecticut River were determined with particular reference to the important commercial fishing area located in the lower 45 km of the river, the heated water discharge are of the Connecticut Yankee Atomic Power Company's powerplant at Haddam Neck, and in the nonchanneled area of the river north of Hartford. Two hundred and thirty shad were fitted with ultrasonic tags; 27 in 1967, 115 in 1968, and 88 in 1969. The migration is complex in nature, with considerable deviation from a straight line, continuous upriver migration. Soon after entering the river from the sea, shad begin to experience the effects of rapid reductions in salinity. These changes in the physical environment are reflected in greatly reduced swim speeds and prolonged meandering at the region of the salt-freshwater interface. Shad are very vulnerable at this stage in the migration, being both weakened and, presumably, concentrated because of the barrier effect of the interface which impedes their progress for up to 70 or more hr. Once through the salt-freshwater interface and fully freshwater-adapted, the migrations become more vigorous and more direct. Shad favor the channeled areas of the river; this has considerable importance with respect to the situating of industrial intake and discharge structures in relation to the river channels. (Knapp-USGS)
W74-11227

KENTUCKY LAKE COMMERCIAL CATFISH CATCH ANALYSIS,
Murray State Univ., Ky. Biological Station.
P. J. Matthai.
Available from NTIS, Springfield, Va., 22161, as COM-73-11185, Price $3.50 printed copy; $2.25 microfiche. Kentucky Department of Fish and Wildlife Resources, Frankfort, Project Report 4-70-R, June 30, 1972. 51 p, 3 fig, 24 tab, 7 ref.

Descriptors: *Catfishes, *Kentucky, *Commercial fish, Fish harvest, Fish populations, Lake fisheries, Creel census.
Identifiers: *Kentucky Lake(KY), Blue catfish.

The total catch of fish from Kentucky Lake of commercial fishermen was studied as the fish were caught. Age, growth, and condition of blue and channel catfish were compared with previous data. A total of 497 bait lines captured 3595 fish of 14 species in 1970-71, and 531 lines captured 4611 fish of 13 species in 1971-72. Blue and channel catfish constituted 92 to 95% of the total catch. A total of 141 gill nets captured 401 fish of 11 species during the first year, and 155 gill nets yielded 453 fish of 11 species during the second. Percentage compositions of the five most numerous species in 1970-71 were: buffalofishes, 42%; blue catfish, 15%; carp and freshwater drum 13% each; and paddlefish, 11%. Comparatively, the compositions in 1971-72 were: buffalofishes, 41%; paddlefish, 20%; carp, 15%; blue catfish, 8%; and freshwater drum, 6%. Comparison of calculated weights of the two species between 10 and 20 inches inclusive shows that blue catfish attainments exceeded those of channel catfish by 8%. Channel catfish condition indices exhibited a slow decline from 32.4 to 30.8, while those of the blue channel catfish were experiencing some degree of retardation, whereas the blue catfish experienced little or no impairment. Comparison with average seven-year length attainments computed for previous surveys indicated that average attainment by channel catfish of the present survey was approximately 4% below that of the preceding study in Kentucky Lake, Kentucky; 26% above that of the Kentucky Lake, Tennessee, study; and 3% below those of both the Norris Reservoir and Watts Bar surveys. The Occurrence of Some Trace Metals in Coastal Organisms with Particular Reference to the Solent Region,
W74-11332 5B

Interrelationship of Biochemical Responses to the Absorption of Inorganic Lead,
W74-11362 5C

ACCLIMATION
The Use of a Mobile Laboratory to Study Temperature Response of Fish,
W74-11297 5C

ACCRETION (LEGAL ASPECTS)
Bonelli Cattle Company V. State of Arizona (Action Brought by Riparian Owner to Quiet Title to Land Which Was Once Submerged Under Colorado River).
W74-11152 6E

ACCUMULATION
Use of Neritic Trophodynamic Chain of Molluscs for the Study of the Transfer of Metallic Pollutants, (Utilisation D'une Chaine Trophodynamique De Type Neritique A Mollusques Pour L'etude Des Transferts Des Polluants Metalliques),
W74-11287 5C

ACID MINE WATER
Coal Humates for the Removal of Water Pollutants Associated With the Use of Coal,
W74-10993

Acid Mine Water Treatment Process,
W74-11408 5D

ACTIVATED CARBON
Filter Systems,
W74-11044 5C

Activated Carbon Adsorption of Petrochemicals,
W74-11086 5D

ACTIVATED SLUDGE
Purifying Plant for Sewage,
W74-11052 5D

Flocculation and Decantation of Paper Industry Waste Waters (Floculation et decantation pes eaux residuaires de papeterie),
W74-11080 5D

New Swiss System for Secondary Treatment is First in North America.
W74-11085 5D

Wisconsin Tissue Effluent Plant Pioneers European Process Here.
W74-11097 5D

Dynamics of the Utilization of Organic Pollutants in Waste Water of the Olaine Chemical-Pharmaceutical Plant by the Heterotrophic Biocoenosis of Active Silt, (in Russian),
W74-11184 5D

The Effect of Surplus Activated Sludge in Filter Press Performance,
W74-11248 5D

Facilities for Controlling the Activated Sludge Process by Mean Cell Residence Time,
W74-11254 5D

Method and Apparatus for Separation of Sludge,
W74-11397 5D

ACTIVATION ANALYSIS (CHARGED PARTICLE)
Determination of Lead Using Charged Particle Activation Analysis,
W74-11349 5A

ACTIVITY
Oxygen Consumption and Activity of the White Sucker (Catostomus Commersoni), In Lethal and Nonlethal Levels of the Organochlorine Insecticide, Methoxychlor,
W74-11320 5C

ADAPTATION
Adaptation of the Polychaete Nereis Diversicolor to Estuarine Sediments Containing High Concentrations of Zinc and Cadmium,
W74-11337 5C

ADMINISTRATION
Rational Institutional Arrangements for Water Resources Management,
W74-10901 6E

ADRIATIC
Changes and Succession in The Benthic Algal Associations of Slightly Polluted Habitats,
W74-11286 5C

ADRIATIC SEA
Long-Term Annual Fluctuations of Mercury in the Zooplankton of the East Central Adriatic,
W74-11291 5B

ADSORPTION
The Use of Magnetic Iron Oxide for Recovery of Virus From Water,
W74-10905 5D

Cation-Exchange Removal of Copper from Ammoniacal Aqueous Solution,
W74-11027 5D

Activated Carbon Adsorption of Petrochemicals,
W74-11086 5D

The Concentration Control of Soluble Copper in a Mine Tailings Stream,
W74-11361 5B

AEDES-AEGYPTI
A Field Trial of Abate Larvicide for the Control of Aedes aegypti in Bangkok, Thailand,
W74-10934 5G

AERATION
Method and Apparatus for the Treatment of Influent Waters Such as Sewage,
W74-10933 5D

Water Aeration Equipment,
W74-11047 5D

Purifying Plant for Sewage,
W74-11052 5D

Sewage Treatment Apparatus,
W74-11053 5D

Aeration Device for the Surface Aeration of Liquids,
W74-11062 5D

Process for Treating Domestic and Industrial Liquid Wastes,
W74-11064 5D

Flocculation and Decantation of Paper Industry Waste Waters (Floculation et decantation pes eaux residuaires de papeterie),
W74-11080 5D

Use of Ozone and Oxygen in Advanced Waste Water Treatment,
W74-11103 5D

A Novel Device for Improved Air and Liquid Mixing (Ujtipusu Keszulek Folyadekok Erintkeztetesere es Keveresere Levegovel),
W74-11116 5D

Method and Apparatus for Separation of Sludge,
W74-11397 5D

Biotreatment Process,
W74-11398 5D

Process for Treating Water,
W74-11406 5D

Sewage Treatment Plant Equipped with an Aeration Impeller,
W74-11415 5D

AEROBIC CONDITIONS
Toxicity of Chromium Compounds Under Aerobic Conditions,
W74-11360 5C

AEROBIC TREATMENT
Use of Pipelines as Aerobic Biological Reactors,
W74-10925 5D

Light Energized Oxidation of Organic Wastes,
W74-10990 5D

A Novel Device for Improved Air and Liquid Mixing (Ujtipusu Keszulek Folyadekok Erintkeztetesere es Keveresere Levegovel),
W74-11116 5D

Aerobic Treatment of Feedlot Runoff,
W74-11281 5D

AEROSOLS
Symposium on Environmental Quality Monitoring; Symposium on Sources and Evolution of the Atmospheric Aerosol; General Papers.
W74-10947 5A

Overview of the California Aerosol Characterization Experiment,
W74-10953 5A

Physical Characterization of California Aerosols,
W74-10954 5A

Photochemical Aerosol Formation in the Atmosphere and in an Environmental Chamber,
W74-10955 5B

AEROSOLS

Sulfate and Nitrate Chemistry in Photochemical Smog,
W74-10956 5A

Characterization and Analysis of Airborne Particulate Material by Infrared Spectroscopy,
W74-10957 5A

H2SO4/(NH4)2SO4 Aerosol: Optical Detection in St. Louis Region,
W74-10965 5A

Direct Determination of the Total Atmospheric Aerosol Mass Distribution,
W74-10967 5A

Comparison of Volume and Mass Distribution for Denver Aerosols,
W74-10968 5B

Mass and Composition of an Urban Aerosol as a Function of Size for Several Visibility Levels,
W74-10969 5B

The Production Rate of Sulfate Aerosol in the Stratosphere: Environmental Implications of a Stratospheric Aircraft Fleet,
W74-10999 5B

Intercomparison of Several Types of Cascade Impactors,
W74-11008 5A

AGE

Trace Metals in Lake Cayuga Lake Trout (Salvelinus Namaycush) in Relation to Age,
W74-11336 5C

AGRICULTURAL RUNOFF

Effects of Spreading Manure on Groundwater and Surface Runoff,
W74-11240 5B

Aerobic Treatment of Feedlot Runoff,
W74-11281 5D

AGRICULTURE

A Systems Approach to Problem Oriented Research Planning: A Case Study of Food Production Wastes,
W74-11040 5G

AIR POLLUTION

Overview of the California Aerosol Characterization Experiment,
W74-10953 5A

Physical Characterization of California Aerosols,
W74-10954 5A

Photochemical Aerosol Formation in the Atmosphere and in an Environmental Chamber,
W74-10955 5B

Sulfate and Nitrate Chemistry in Photochemical Smog,
W74-10956 5A

Characterization and Analysis of Airborne Particulate Material by Infrared Spectroscopy,
W74-10957 5A

The Urban Plume of St. Louis,
W74-10964 5B

H2SO4/(NH4)2SO4 Aerosol: Optical Detection in St. Louis Region,
W74-10965 5A

SO2 Oxidation Mechanism in Olefin-NOx-SO2 Smog,
W74-10966 5B

Direct Determination of the Total Atmospheric Aerosol Mass Distribution,
W74-10967 5A

Coal Humates for the Removal of Water Pollutants Associated With the Use of Coal,
W74-10993 5D

The Elemental Composition of the Aerosol in Pasadena, California,
W74-10994 5A

A Spectroscopic Study of Pasadena Smog,
W74-10995 5A

Photochemical Reactions in a Dual Outdoor Smog Chamber,
W74-10996 5A

Kinetic Studies of the Stabilities of Chloromethyl Methyl Ether and BIS (Chloromethyl) Ether in Humid Air,
W74-10997 5B

Carbon-Monoxide-Induced Particles from Hopcalite Catalyst,
W74-10998 5B

The Production Rate of Sulfate Aerosol in the Stratosphere: Environmental Implications of a Stratospheric Aircraft Fleet,
W74-10999 5B

Detection of Hydrocarbons by Chemiluminescence with Active Nitrogen at 388 nm,
W74-11000 5A

A Colorimeter System for Determination of The Method 6 Thorin Titration Endpoint,
W74-11001 5A

Operation Characteristics of NO2 Permeation Devices,
W74-11002 5A

A Piezoelectric Sensor for Mercury in Air,
W74-11003 5A

The Fluorescence Detection of Nitric Oxide,
W74-11004 5A

Chemical Analysis of the Smoky-Burnt Odor Complex in Diesel Exhaust,
W74-11005 5A

An Automated Instrument for the Continuous Measurement of Reactive Hydrocarbons,
W74-11007 5A

Intercomparison of Several Types of Cascade Impactors,
W74-11008 5A

Determination of Total Mercury in Air by Charcoal Adsorption and Ultraviolet Spectrophotometry,
W74-11363 5A

Control of Sulfur Oxide Pollution from Power Plants,
W74-11431 5G

AIR-WATER INTERFACES

Rate of Evaporation of Water From Capillaries of Different Diameter Into Moist Air (Skorost' ispareniya vody iz kapillyarov raznykh diametrov vo vlazhnyy vozdukh),
W74-11448 2D

AIRCRAFT

The Production Rate of Sulfate Aerosol in the Stratosphere: Environmental Implications of a Stratospheric Aircraft Fleet,
W74-10999 5B

AIRPORTS

Offshore Airports Ease Environmental Problems,
W74-11127 6G

ALASKA

The Distribution and Succession of Aquatic Vascular Plant Communities in Relation to Physical-Chemical Characteristics of Various Lakes and Ponds of The Tanana Valley, Central Alaska,
W74-11282 5C

Flood Plain Information, Hoadley Creek, Ketchikan, Alaska.
W74-11427 4A

Flood Plain Information, Whipple Creek, Ketchikan, Alaska.
W74-11428 4A

Flood Plain Information, Carlanna Creek, Ketchikan, Alaska.
W74-11429 4A

Flood Plain Information, Ketchikan Creek, Ketchikan, Alaska.
W74-11430 4A

ALBANY (NY)

The Pressure Sewer: A New Alternative to the Gravity Sewer,
W74-10946 5D

ALDRIN

Chlorinated Insecticide Residues in the Eggs of Some Freshwater Fish,
W74-11323 5C

ALFALFA

Calcium, Magnesium, and Potassium Saturation Ratios in Two Soils and Their Effects Upon Yields and Nutrient Contents of German Millet and Alfalfa,
W74-11269 3F

ALGAE

The Intensity of the Filamentous Algal Photosynthetic Activity in the Flood Plain Lake Nizhnii Ustup and Middle Dnieper, (In Russian),
W74-11157 5C

Information on the Recent Practice of Hygienic Qualifications of Surface Waters, (Tajekoztato a Felszini Vizek Higienes Minositesenek Jelenlegi Gyakorlatarol),
W74-11256 5G

The Effect of Polluted Water on The Assimilation Rate of The Brown Algae Ascophyllum Nodosum (L.) Le Jol. and Fucus Vesiculosus (L.) (Preliminary Experiment),
W74-11284 5C

Changes and Succession in The Benthic Algal Associations of Slightly Polluted Habitats,
W74-11286 5C

Heavy Metal Tolerance of Marine Phytoplankton. I. The Tolerance of Three Algal Species to Zinc in Coastal Sea Water,
W74-11329 5C

ALGAL CONTROL

Algae Control in Water Supply Reservoirs,
W74-11165 5F

ALGEBRAIC TECHNOLOGICAL FUNCTION

Nonlinear Technological Functions for Aquifers Whose Transmissivities Vary with Drawdown,
W74-11424 2F

LGICIDES
The Effect of CuSo4 Algicide Doses Upon the Routine Metabolism of Common Carp (Cyprinus carpio L.) And Prussian Carp (Carassius auratus gibelio (Bloch)), (In Rumanian),
W74-11176 5C

LGORITHMS
A Finite Element Approach to Watershed Runoff,
W74-10937 2A

LIPHATIC AMINES
Effect of Cattle Feedlot Volatiles, Aliphatic Amines, on Chlorella Ellipsoidea Growth,
W74-11238 5C

LKALI SOILS
Growth, Mineral Composition, and Seed Oil of Sesame (Sesamum indicum L.) as Affected by Boron and Exchangeable Sodium,
W74-11278 3C

LTERNATE PLANNING
Rational Institutional Arrangements for Water Resources Management,
W74-10901 6E

LUMINUM
Filter Pore-Size Effects on the Analysis of Al, Fe, Mn, and Ti in Water,
W74-11421 5A

MERICAN RIVER
A Bill to Amend The Wild and Scenic Rivers Act of 1968.
W74-11154 6E

MINO ACIDS
Free Amino Acid Variations in the Anchovy, Engraulis Mordax (Girard) from the Los Angeles Coastal Area,
W74-11294 5C

MMONIA REMOVAL
Advanced Waste Treatment Process Selection, Part Three,
W74-11135 5C

MMONIUM PYROLLIDINE
THIOCARBAMATE/METHYL ISOBUTYL
ETONE SYSTEM
The Solvent Extraction Atomic Absorption Analysis of Effluents and Water,
W74-11260 5A

MU-DAR'YA RIVER (USSR)
Catalog of USSR Glaciers. Volume 14. Soviet Central Asia. No. 3. Amu-Dar'ya. Part 6. Surkhob River Basin Between Mouths of the Obikhingou and Muksu Rivers (Katalog lednikov SSSR. Tom 14. Srednyaya Aziya. Vypusk 3. Amu-Dar'ya. Chast' 6. Basseyn r. Surkhob mezhdu ust'yami rek Obikhingou i Muksu),
W74-11215 2C

NAEROBIC CONDITIONS
Restoration of an Oyster Resource Destroyed by Natural Causes,
W74-11163 8I

NAEROBIC DIGESTION
Digestion Byproduct May Give Answer to Energy Problem,
W74-10935 5D

NALYTICAL PROCEDURES
Determination of Lead Using Charged Particle Activation Analysis,
W74-11349 5A

Mercury Determinations in Natural Waters by Persulfate Oxidation,
W74-11378 5A

ANALYTICAL TECHNIQUES
A Preliminary Evaluation of a Discrete Sample Analyzer for Chemical Analysis of Water,
W74-10936 5A

Validation of Environmental Data by Intercalibration and Laboratory Quality Control Programs,
W74-10950 5A

Colorimetric Method for the Determination of Arsenic (III) in Aquatic Environment,
W74-10984 5A

An Improved Field Method for Determination of Discontinuous Capillary Moisture (Usovershenstvovannyy polevoy metod opredeleniya vlazhnosti razryva kapillyarnoy svyazi),
W74-11014 2G

Method of Investigation of Nonlinear Filtration Effects (O metodike issledovaniya nelineynykh fil'tratsionnykh effektov),
W74-11016 7B

The Integration of System Identification and System Optimization,
W74-11042 6A

APDC-MIBK Extraction System for the Determination of Copper and Iron in 1 Cu Cm of Sea Water by Flameless Atomic-Absorption Spectrometry,
W74-11078 5A

A Potentiometric Method for the Determination of Chloride in Boiler Waters in the Range 0.1 to 10 Microgram Per Ml of Chloride,
W74-11079 5A

The Determination of Vanadium in Sea Water by Hot Graphite Atomic Absorption Spectrometry on Chitosan After Separation from Salt,
W74-11109 5A

A Study of the Possibility of Indicating Bacteria in Water by a Spectroultramicroscopic Method, (In Russian),
W74-11121 5A

A Method for Rapid Identification of Typhoid and Dysentery Bacteria in Water,
W74-11162 5C

The Solvent Extraction Atomic Absorption Analysis of Effluents and Water,
W74-11260 5A

A Modified Ion Exchange Technique for the Determination of Stability Constants of Metal-Soil Organic Matter Complexes,
W74-11262 5A

The Utilization of a Simple Experimental Device for Study of Water Pollution in Situ: Comparative Effects of Three Anti-Petroleum Emulsifying Agents,
W74-11334 5C

Potentiometric Measurement of Copper in Seawater with Ion 1 = 1 Selective Electrodes,
W74-11350 5A

Spectrochemical Method For the Determination of 36 Elements in Industrial Effluent,
W74-11351 5A

Trace Metal Analysis in Water by Proton-Induced X-Ray Emission Analysis of Ion-Exchange Membranes,
W74-11355 5A

Determination of Total Mercury in Air by Charcoal Adsorption and Ultraviolet Spectrophotometry,
W74-11363 5A

Solvent Extraction for the Separation of Metals,
W74-11365 5A

The Determination of Trace Quantities of Molybdenum by Atomic Absorption Spectroscopy,
W74-11371 5A

Lead-Poisoning Detector.
W74-11377 5A

Determination of Submicrogram Amounts of Mercury by the Oxygen Bomb Combustion Method,
W74-11388 5A

Analysis of Organic Mercury Compounds by Gas Chromatography,
W74-11390 5A

Design and Evaluation of a Vidicon Scanning Spectrometer for Molecular Absorption and Atomic Emission Spectrometry,
W74-11394 5A

Filter Pore-Size Effects on the Analysis of Al, Fe, Mn, and Ti in Water,
W74-11421 5A

ANGARA RIVER (USSR)
Catalog of USSR Glaciers. Volume 16. Angara-Yenisey Region. No. 1. Yenisey. Parts 3-5. No. 2. Angara. Part 1. (Katalog lednikov SSSR. Tom 16. Angaro-Yeniseyskiy rayon. Vypusk 1. Yenisey. Chasti 3-5. Vypusk 2. Angara. Chast' 1),
W74-11213 2C

ANIMAL MANURE
Soil Columns for Simulating Animal Manure Recycling,
W74-11242 5D

ANIMAL PATHOLOGY
Scientists Find How Mercury Damages Cells,
W74-11369 5C

The Interaction of Mercury with Cadmium and Zinc in Mammalian Embryonic Development,
W74-11375 5C

ANIMAL POPULATIONS
Role of the Environment in the Formation of Density Dynamics of the Muskrat of Yakutsk, (in Russian),
W74-11198 2C

ANIONS
Analyses of Paper Machine Waters with Ion-Specific Electrodes. Part I. Effect of pH and Ionic Strength of Solution on Calcium, Cupric, Chloride, Sodium, and Nitrate Ion Specific Electrodes,
W74-11093 5A

Analyses of Paper Machine Waters with Ion-Specific Electrodes, Part II. Calcium, Cupric, Chloride, Sodium and Nitrate Ion Specific Electrode Potentials at Various Temperatures and in Composite Solutions,
W74-11094 5A

ANIONS

Effect of Water Hardness on the Toxicity of an Anionic Detergent to Fish,
W74-11310 5C

ANNELIDS
The Sublethal Effects of Environmental Variables on Polychaetous Annelids,
W74-11292 5C

Influence of Salinity and Ionic Equilibrium on the Contamination of Arenicola Marina L. (Annelide: Polycheate) by Cesium-137, (Influence de la Salinite et de L'Equilibre Ionique Sur la Contamination D'Arenicola Marina L. (Annelide: Polychete) Par le Caesium-137.),
W74-11328 5C

ANOXIC SEDIMENT
Oxidation Effect on the Analysis of Iron in the Interstitial Water of Recent Anoxic Sediments,
W74-11379 5B

ANTHROPOGENIC ADDITIONS
Mercury Organic Matter Associations in Estuarine Sediments and Interstitial Water,
W74-11122 5B

ANTIPOLLUTION PRODUCTS
Ichthyotoxic Effects of Some Anti-Pollution Products,
W74-11327 5C

AQUATIC DRIFT
Seasonal Changes in the Drift and Benthic Macroinvertebrates in the Unchannelized Missouri River in South Dakota,
W74-11160 5C

AQUATIC FAUNA
Laboratory and Controlled Experimental Stream Studies of the Effects of Kraft Effluents on Growth and Production of Fish,
W74-11087 5C

Potential Effects of Thermal Discharges on Aquatic Systems,
W74-11107 5C

AQUATIC INSECTS
Seasonal Changes in the Drift and Benthic Macroinvertebrates in the Unchannelized Missouri River in South Dakota,
W74-11160 5C

AQUATIC LIFE
The Vanadium and Selected Metal Contents of Some Ascidians,
W74-11353 5A

AQUATIC MICROORGANISMS
Preliminary Laboratory Studies of the Decolorization and Bactericidal Properties of Ozone in Pulp and Paper Mill Effluents,
W74-11089 5D

AQUATIC PLANTS
Aquatic-Bog Vegetation of the Samur River Basin, (In Russian),
W74-11172 2I

The Distribution and Succession of Aquatic Vascular Plant Communities in Relation to Physical-Chemical Characteristics of Various Lakes and Ponds of The Tanana Valley, Central Alaska,
W74-11282 5C

AQUEOUS SOLUTIONS
Mercury Determinations in Natural Waters by Persulfate Oxidation,
W74-11378 5A

AQUICULTURE
Experimental Hydroponic Gardening with Municipal Waste Water,
W74-10917 5D

AQUIFER MANAGEMENT
Method of Treating Subterranean Formation to Improve Permeability,
W74-10931 8B

AQUIFER TESTING
Smoke Testing Pinpoints Surface Water Inflow,
W74-11082 8A

AQUIFERS
Artificial Aquifer Stops Storm Pollution.
W74-10929 5D

Comparison of the Efficiencies of Vertical and Horizontal Drainage (Sravnitel'naya effektivnost' vertikal'nogo i gorizontalnogo drenazha),
W74-10939 3F

Hydrogeology of the USSR. Volume 15: Bashkir ASSR (Gidrogeologiya SSSR. Tom XV. Bashkirskaya ASSR).
W74-11017 2F

Hydrogeology of the USSR. Volume 29: Kamchatka, and the Kuril and Komandorskiye Islands (Gidrogeologiya SSSR. Tom XXIX. Kamchatka, Kuril'skiye i Komandorskiye ostrova).
W74-11018 2F

Hydrogeology of the USSR. Volume 38: Turkmen SSR (Gidrogeologiya SSSR. Tom XXXVIII. Turkmenskaya SSR).
W74-11019 2F

Hydrogeology of the USSR. Volume 40: Kirgiz SSR (Gidrogeologiya SSSR. Tom XL. Kirgizskaya SSR).
W74-11020 2F

Nonlinear Technological Functions for Aquifers Whose Transmissivities Vary with Drawdown,
W74-11424 2F

ARENICOLA MARINA
Influence of Salinity and Ionic Equilibrium on the Contamination of Arenicola Marina L. (Annelide: Polycheate) by Cesium-137, (Influence de la Salinite et de L'Equilibre Ionique Sur la Contamination D'Arenicola Marina L. (Annelide: Polychete) Par le Caesium-137.),
W74-11328 5C

ARID CLIMATES
Evaporation of Water from Sand, 3: The Loss of Water into the Atmosphere from a Sandy River Bed Under Arid Climatic Conditions,
W74-11266 2D

ARIZONA
Tucson Tackles Two Problems.
W74-10945 5D

Bonelli Cattle Company V. State of Arizona (Action Brought by Riparian Owner to Quiet Title to Land Which Was Once Submerged Under Colorado River).

An Improved Field Method for Determination of Discontinuous Capillary Moisture (Usovershenstvovannyy polevoy metod opredeleniya vlazhnosti razryva kapillyarnoy svyazi),
W74-11014 2G

Rate of Evaporation of Water From Capillaries of Different Diameter Into Moist Air (Skorost' ispareniya vody iz kapillyarov raznykh diametrov vo vlazhnyy vozdukh),
W74-11448 2D

CAPILLARY WATER
An Improved Field Method for Determination of Discontinuous Capillary Moisture (Usovershenstvovannyy polevoy metod opredeleniya vlazhnosti razryva kapillyarnoy svyazi),
W74-11014 2G

CAPITAL COSTS
Use of Ozone and Oxygen in Advanced Waste Water Treatment,
W74-11103 5D

CARASSIUS AURATUS
The Effect of Heavy Metal on Protein Synthesis in Crustaceans and Fish,
W74-11295 5C

CARBOHYDRATES
Fluorimetric Determination of Carbohydrates in Sea Water,
W74-11110 5A

CARLANNA CREEK (AK)
Flood Plain Information, Carlanna Creek, Ketchikan, Alaska.
W74-11429 4A

CARP
Contributions to the Comparative Study of the Seasonal Biorhythm of Gonads and Pituitary Nuclei Acids in Ctenopharyngodon Idelia (Val.) Reared in Ponds or Living in Natural Waters, (In Rumanian),
W74-11128 2H

Experiments in the Nutrition of Carp Growing in Cages,
W74-11190 2H

Determination of the Hematocrit Value of Carp and Its Influencing with Cobalt, (Stanoveni Hematodritove Hodnoty Kapru a Jeji Ovlivneni Kobaltem),
W74-11316 5C

CASCADE IMPACTORS
Intercomparison of Several Types of Cascade Impactors,
W74-11008 5A

CATALYSTS
Carbon-Monoxide-Induced Particles from Hopcalite Catalyst,
W74-10998 5B

Polluted Water Purification,
W74-11407 5D

CATFISHES
Kentucky Lake Commercial Catfish Catch Analysis,
W74-11434 8I

CATIONS
Analyses of Paper Machine Waters with Ion-Specific Electrodes. Part I. Effect of pH and Ionic Strength of Solution on Calcium, Cupric, Chloride, Sodium, and Nitrate Ion Specific Electrodes,
W74-11093 5A

Analyses of Paper Machine Waters with Ion-Specific Electrodes, Part II. Calcium, Cupric, Chloride, Sodium and Nitrate Ion Specific Electrode Potentials at Various Temperatures and in Composite Solutions,
W74-11094 5A

CATOSTOMUS COMMERSONI
Oxygen Consumption and Activity of the White Sucker (Catostomus Commersoni), In Lethal and Nonlethal Levels of the Organochlorine Insecticide, Methoxychlor,
W74-11320 5C

CATTLE
A Beef Confinement Building with an Oxidation Ditch,
W74-11241 5D

More Beef on the Hoof Goal of Ohio Research.
W74-11244 5D

Fecal Elimination of Estrogens by Cattle Treated with Diethylstilbestrol and Hexestrol,
W74-11245 5B

CAVITATION
The Use of Standard Bodies to Measure the Cavitation Strength of Water,
W74-11034 8B

CELLULOSE
Membranes for Reverse Osmosis,
W74-10932 5D

CELLULOSE ACETATE
Membranes for Reverse Osmosis,
W74-10932 5D

CENTRIFUGATION
Scale-Up Solid Bowl Centrifuge Performance,
W74-10914 5D

CERASTODERMA EDULE
Trace Metals in Sediments and Bivalve Mollusca in Southampton Water and the Solent,
W74-11288 5B

CESIUM
Influence of Salinity and Ionic Equilibrium on the Contamination of Arenicola Marina L. (Annelide: Polycheate) by Cesium-137, (Influence de la Salinite et de L'Equilibre Ionique Sur la Contamination D'Arenicola Marina L. (Annelide: Polychete) Par le Caesium-137.),
W74-11328 5C

CHANNEL FLOW
The Determination of Zones of Intense Contribution to Stream Flow as Related to the Concept of Partial Area Contributions,
W74-10904 2A

CHANNEL IMPROVEMENT
Moorhead Bayou Watershed, Sunflower County, Mississippi (Final Environmental Impact Statement).
W74-11143 6E

Tombigbee River (East Fork), Itawamba County, Mississippi. Operation and Maintenance.
W74-11144 4A

CHARA RIVER BASIN (USSR)
Catalog of USSR Glaciers. Volume 17. Lena-Indigirka Region. No. 2. Middle Lena. Part 1; No. 5. Lower Lena. Part 2. (Katalog lednikov SSSR. Tom 17. Lensko-Indigirskiy rayon. Vypusk 2. Srednyaya Lena. Chast' 1; Vypusk 5. Nizhnyaya Lena. Chast' 2.),
W74-11218 2C

CHEGEM RIVER BASIN (USSR)
Catalog of USSR Glaciers. Volume 8. Northern Caucasus. Part 6. Chegem River Basin. Part 7. Cherek River Basin(Katalog lednikov SSSR. Tom 8. Severnyy Kavkaz. Chast' 6. Basseyn r. Chegema. Chast' 7. Basseyn r. Chereka),
W74-11216 2C

CHELATION
Application of Chelating Ion Exchange Resins for Trace Element Analysis of Geological Samples Using X-Ray Fluorescence,
W74-11364 5A

Predicting Chelate Performance in Boilers,
W74-11380 5B

Comparison of Observed and Calculated Concentrations of Dissolved Al and Fe in Stream Water,
W74-11422 5A

CHELONIA MYDAS
Polychlorinated Biphenyls and P,P' DDE in Green Turtle Eggs from Ascension Island, South Atlantic Ocean,
W74-11335 5C

CHEMICAL ANALYSIS
A Preliminary Evaluation of a Discrete Sample Analyzer for Chemical Analysis of Water,
W74-10936 5A

Colorimetric Method for the Determination of Arsenic (III) in Aquatic Environment,
W74-10984 5A

Determination of Chlorination Effects on Organic Constituents in Sewage Treatment Plant Effluents: A Coupled 36Cl Tracer--High-Resolution Chromatographic Technique,
W74-10989 5D

Operation Characteristics of NO2 Permeation Devices,
W74-11002 5A

Chemical Analysis of the Smoky-Burnt Odor Complex in Diesel Exhaust,
W74-11005 5A

The Determination of Vanadium in Sea Water by Hot Graphite Atomic Absorption Spectrometry on Chitosan After Separation from Salt,
W74-11109 5A

Determination of Trace Metals in Sodium Dithionite-Citrate Extracts of Soils and Sediments by Atomic Absorption,
W74-11425 5A

CHEMICAL OXYGEN DEMAND
Total Oxygen Demand: A New Tool for Wastewater Analysis,
W74-11083 5D

CHEMICAL-PHYSICAL TREATMENT
Computer Simulation of Waste Water Treatment by Chemical-Physical Processes,
W74-11037 5D

CHEMICAL PRECIPITATION
Predicting Chelate Performance in Boilers,
W74-11380 5B

CHEMICAL REACTIONS
Photochemical Reactions in a Dual Outdoor Smog Chamber,
W74-10996 5A

Formation of Methylmercury in a Terrestrial Environment,
W74-11393 5B

CHEMICAL TREATMENT
Process for Treating Oil Slicks Using Chemical Agents,
W74-11059 5G

Selective Adsorption of Phenols from Solution in Water,
W74-11063 5D

Process for Treating Domestic and Industrial Liquid Wastes,
W74-11064 5D

CHEMICALS
Markets for Chemicals Grow and Grow,
W74-11118 5D

CHEMILUMINESCENCE
Detection of Hydrocarbons by Chemiluminescence with Active Nitrogen at 388 nm,
W74-11000 5A

The Fluorescence Detection of Nitric Oxide,
W74-11004 5A

CHEREK RIVER BASIN (USSR)
Catalog of USSR Glaciers. Volume 8. Northern Caucasus. Part 6. Chegem River Basin. Part 7. Cherek River Basin(Katalog lednikov SSSR. Tom 8. Severnyy Kavkaz. Chast' 6. Basseyn r. Chegema. Chast' 7. Basseyn r. Chereka),
W74-11216 2C

CHESAPEAKE BAY
Data Bank Inventory: Vol. II--Chesapeake Bay, Edition 1, 1949 Through 1970,
W74-11026 2L

Oxidation Effect on the Analysis of Iron in the Interstitial Water of Recent Anoxic Sediments,
W74-11379 5B

CHEZY EQUATION
Roughness Coefficients of Vegetated Flood Plains,
W74-11136 2E

CHLORDANE
Chlorinated Insecticide Residues in the Eggs of Some Freshwater Fish,
W74-11323 5C

CHLORELLA ELLIPSOIDEA
Effect of Cattle Feedlot Volatiles, Aliphatic Amines, on Chlorella Ellipsoidea Growth,
W74-11238 5C

CHLORIDES
A Potentiometric Method for the Determination of Chloride in Boiler Waters in the Range 0.1 to 10 Microgram Per Ml of Chloride,
W74-11079 5A

CHLORINATED HYDROCARBON PESTICIDE
Chlorinated Insecticide Residues in the Eggs of Some Freshwater Fish,
W74-11323 5C

CHLORINATED HYDROCARBON PESTICIDES
The Use of an Electron Capture Detector for the Determination of Pesticides in Water,
W74-11077 5A

Oxygen Consumption and Activity of the White Sucker (Catostomus Commersoni), In Lethal and Nonlethal Levels of the Organochlorine Insecticide, Methoxychlor,
W74-11320 5C

DDT, DDE, and PCBs In the Tissues of Reef Dwelling Groupers (Serranidae) In the Gulf of Mexico and the Grand Bahamas,
W74-11347 5B

The Avifauna of Sweden as Indicators of Environmental Contamination with Mercury and Chlorinated Hydrocarbons,
W74-11367 5B

CHLORINATION
An Amperometric Membrane Halogen Analyzer,
W74-10980 5A

Determination of Chlorination Effects on Organic Constituents in Sewage Treatment Plant Effluents: A Coupled 36Cl Tracer--High-Resolution Chromatographic Technique,
W74-10989 5D

Advanced Waste Treatment Process Selection Part Three,
W74-11135 5C

CHLOROMETHYL METHYL ETHER
Kinetic Studies of the Stabilities of Chloromethyl Methyl Ether and BIS (Chloromethyl) Ether in Humid Air,
W74-10997 5E

CHLOROPHYLL
Copepod and Chlorophyll a Concentrations in Receiving Waters of a Nuclear Power Station and Problems Associated With Their Measurement,
W74-11343 5E

HROMATOGRAPHY
The Determination of Benzidine in Wastewaters,
W74-10991 5A

Fluorescence Spectroscopic Determination of Anti-Ovulatory Steroids in Water and Water and Waste Water on the Thin Layer Chromatography Plate, (in Russian),
W74-11195 5A

Ion-Exchange Paper Chromatography of Metal Ions with Mixed Aqueous-Organic Solvents Containing Mineral Acid and a Selective Extractant,
W74-11374 5A

HROMIUM
Trace Metals in Lake Cayuga Lake Trout (Salvelinus Namaycush) in Relation to Age,
W74-11336 5C

Toxicity of Chromium Compounds Under Aerobic Conditions,
W74-11360 5C

HU RIVER (USSR)
Catalog of USSR Glaciers. Volume 14. Soviet Central Asia. No. 2. Kirgizia. Part 3. Basin in Upper Reaches of the Chu River (Katalog lednikov SSSR. Tom 14. Srednyaya Aziya. Vypusk 2. Kirgiziya. Chast' 3. Basseyn verkhov'yev r. Chu),
W74-11219 2C

Catalog of USSR Glaciers. Volume 14. Soviet Central Asia. No. 2. Kirgizia. Part 2. Basins of Left-Bank Tributaries of the Chu River Downstream from Mouth of the Komorchek River (Katalog lednikov SSSR. Tom 14. Srednyava Aziya. Vypusk 2. Kirgiziya. Chast' 2. Basseyny levykh pritokov r. Chu nizne ustya r. Komorchek),
W74-11221 2C

HUYA RIVER BASIN (USSR)
Catalog of USSR Glaciers. Volume 15. Altay and West Siberia. No. 1. Gornyy Altay and Upper Irtysh. Part 6. Chuya River Basin (Katalog lednikov SSSR. Tom 15. Altay i Zapadnaya Sibir'. Vypusk 1. Gornyy Altay i Verkhniy Irtysh. Chast' 6. Basseyn r. Chui),
W74-11214 2C

ITIES
Urbanization and the Environment--Engineering Implications,
W74-11124 4C

LARIFICATION
Polyelectrolytes as Primary Coagulants for Potable Water Systems,
W74-11117 5F

LAY MINERALS
Filter Pore-Size Effects on the Analysis of Al, Fe, Mn, and Ti in Water,
W74-11421 5A

LIMATOLOGY
Causes for Precipitation Increases in the Hills of Southern Illinois,
W74-11138 2B

Glaciohydroclimatology of Mountainous Countries (Glyatsiogidroklimatologiya gornykh stran).
W74-11446 2C

CLOUD PHYSICS
A Summary of the U.S. Navy Program and FY 1970 Progress in Weather Modification and Control.
W74-11203 3B

CLOUD SEEDING
Warm Fog Area Seeding Studies,
W74-11032 3B

Atmospheric Water Resources Management Program,
W74-11229 3B

COAGULATION
Vacuum Filtration of Sludge,
W74-11084 5D

COAL MINE WASTES
Coal Humates for the Removal of Water Pollutants Associated With the Use of Coal,
W74-10993 5D

COANDA EFFECT
The Coanda-Effect Oil-Water Separator: A Feasibility Study,
W74-11436 5D

COASTAL ENGINEERING
Concrete Armor Units for Protection Against Wave Attack, Report of AD HOC Committee on Artificial Armor Units for Coastal Structures.
W74-11209 8F

COASTS
A National Overview of Existing Coastal Water Quality Monitoring.
W74-11010 5A

Policy For Location of Power Plants in Coastal Areas,
W74-11145 6G

COBALT
Contamination of Marine Trophic Chains by Cobalt 60 (Consumption of Contaminated Arenicolae by Plaice and Crabs), (Contamination De Chaines Trophiques Marines Par Le Cobalt 60 (Consommation d'Arenicoles Contaminees Par Des Plies et Des Crabes)),
W74-11289 5C

The Accumulation and Retention of 59Fe and 58Co by the Plaice, Pleuronectes Platessa L.,
W74-11300 5C

The Accumulation from Sea Water of 65Zn, 54Mn, 58Co and 59Fe by the Thornback Ray, Raja Clavata L.,
W74-11304 5C

Determination of the Hematocrit Value of Carp and Its Influencing with Cobalt, (Stanoveni Hematodritove Hodnoty Kapru a Jeji Ovlivneni Kobaltem),
W74-11316 5C

COBALT RADIOISOTOPES
Contamination of Marine Trophic Chains by Cobalt 60 (Consumption of Contaminated Arenicolae by Plaice and Crabs), (Contamination De Chaines Trophiques Marines Par Le Cobalt 60 (Consommation d'Arenicoles Contaminees Par Des Plies et Des Crabes)),
W74-11289 5C

COD
Investigations on the Toxicity of Sea Water-Extracts of Three Crude Oils on Eggs of Cod (Gadus Morhua L.),
W74-11298 5C

COLIFORMS
Preliminary Laboratory Studies of the Decolorization and Bactericidal Properties of Ozone in Pulp and Paper Mill Effluents,
W74-11089 5D

COLLABORATIVE TESTS
Validation of Environmental Data by Intercalibration and Laboratory Quality Control Programs,
W74-10950 5A

Need for Collaborative Studies of Standard Methods,
W74-10951 5A

COLLOIDS
Possibilities of Using Chemical-Physical Purification Process for Waste Waters (Einsatzmoeglichkeiten chemischphysikalischer Reinigungsverfahren bei Restabwaessern),
W74-11099 5D

COLOR
Preliminary Laboratory Studies of the Decolorization and Bactericidal Properties of Ozone in Pulp and Paper Mill Effluents,
W74-11089 5D

Decolorization of Bleach Plant Effluent and Chloride Handling,
W74-11092 5D

Ozone Decolorization of Effluents from Secondary Treatment,
W74-11095 5D

DESIGN FLOW
Application Hydrologic and Hydraulic Research to Culvert Selection in Montana--Vol II, Appendices,
W74-11022 8B

DETERGENTS
Relations Between the Pollution of the Cortiou Sector by Anionic Detergents and Modifications in Populations of Cystoseira stricta, (In French),
W74-11174 5C

Effect of Water Hardness on the Toxicity of an Anionic Detergent to Fish,
W74-11310 5C

Apparatus for Treating and Purifying Sewage, Particularly Sewage Contaminated with Detergents,
W74-11411 5D

DEWATERING
Modern Processes of Sludge Dewatering (Moderne Verfahren zur Schlammentwaesserung),
W74-11066 5D

Vacuum Filtration of Sludge,
W74-11084 5D

Use of the Multiroll Press for Dewatering Clarifier Sludge,
W74-11096 5D

The Effect of Surplus Activated Sludge in Filter Press Performance,
W74-11248 5D

DIALYSIS
Heavy Metal Tolerance of Marine Phytoplankton. I. The Tolerance of Three Algal Species to Zinc in Coastal Sea Water,
W74-11329 5C

DIATOMS
Galltrasket: The Geological Development and Palaeolimnology of a Small Polluted Lake in Southern Finland,
W74-11173 2H

DIELDRIN
Short Term Fate of Dietary Dieldrin in the Digestive Tract of Juvenile Lake Trout (Salvelinus Namaycush),
W74-11308 5C

Chlorinated Insecticide Residues in the Eggs of Some Freshwater Fish,
W74-11323 5C

DIETHYLSTILBESTROL
Fecal Elimination of Estrogens by Cattle Treated with Diethylstilbestrol and Hexestrol,
W74-11245 5B

DIFFUSION
New Analytical Solutions for Dye Diffusion Equations,
W74-11021 2E

DIGESTION
Short Term Fate of Dietary Dieldrin in the Digestive Tract of Juvenile Lake Trout (Salvelinus Namaycush),
W74-11308 5C

DIKES
Waters and Watercourses---Liability for Diking Floodwaters: Rejection of The 'Common Enemy' Doctrine.
W74-11149 6E

DILUTION FACTOR
Localized Thermal Pollution in Shallow Streams, (Near-Field Temperature Distributions),
W74-10902 5B

DILUTION WATER
Continuous-Flow Bioassays with Aquatic Organisms: Procedures and Applications,
W74-11326 5A

DIPTERA
Introduction to the Faunistic Study of Diptera in a Stream From the Pyrenees Near the Atlantic Coast: The Lissuraga, (In French),
W74-11179 2E

DISCHARGE (WATER)
Groundwater Discharge from the Edwards and Associated Limestones, San Antonio Area, Texas, 1973,
W74-11440 2F

DISINFECTION
Preliminary Laboratory Studies of the Decolorization and Bactericidal Properties of Ozone in Pulp and Paper Mill Effluents,
W74-11089 5D

DISPERSANTS
Toxicity Study of Two Oil Spill Reagents Toward Hudson River Fish Species,
W74-11344 5C

DISPERSION
New Analytical Solutions for Dye Diffusion Equations,
W74-11021 2E

Toxicity Study of Two Oil Spill Reagents Toward Hudson River Fish Species,
W74-11344 5C

DISSOLVED OXYGEN
Dissolved Oxygen and Primary Production in Hypertrophic Shallow Lakes in the District of the River Havel,
W74-11170 2K

The Sublethal Effects of Environmental Variables on Polychaetous Annelids,
W74-11292 5C

Process for Treating Water,
W74-11406 5D

DISTILLATION
Multistage Evaporator,
W74-11050 3A

A Study on the Fractionation of Organic Matter in Natural Water by Ultrafiltration Techniques,
W74-11187 2K

Evaporating Method and Evaporating Apparatus,
W74-11396 3A

Desalinzation System,
W74-11400 3A

Multiple Effect Evaporating Apparatus,
W74-11401 3A

Evaporating Method and Apparatus,
W74-11402 3A

Distillation of Saline Water by Direct Contact Heat Exchange with Immiscible Liquid,
W74-11414 3A

DISTRIBUTION
The Distribution and Succession of Aquatic Vascular Plant Communities in Relation to Physical-Chemical Characteristics of Various Lakes and Ponds of The Tanana Valley, Central Alaska,
W74-11282 5C

The Effect of Polluted Water on The Assimilation Rate of The Brown Algae Ascophyllum Nodosum (L.) Le Jol. and Fucus Vesiculosus (L.) (Preliminary Experiment),
W74-11284 5C

The Concentration Control of Soluble Copper in a Mine Tailings Stream,
W74-11361 5B

The Distribution of Trace Metals in the Surficial Sediments Surrounding Keweenaw Point, Upper Michigan,
W74-11391 5B

DISTRIBUTION PATTERNS
The Determination of Zones of Intense Contribution to Stream Flow as Related to the Concept of Partial Area Contributions,
W74-10904 2A

Direct Determination of the Total Atmospheric Aerosol Mass Distribution,
W74-10967 5A

Comparison of Volume and Mass Distribution for Denver Aerosols,
W74-10968 5B

DIURNAL
Biogeochemistry of a Reservoir Ecosystem,
W74-11164 5C

DIVERSION STRUCTURES
Waters and Watercourses---Liability for Diking Floodwaters: Rejection of The 'Common Enemy' Doctrine.
W74-11149 6E

DIVERSITY INDEX
Numerical Indices Applied to the Results of a Survey of the Macro-Invertebrate Fauna of the Tamar Catchment (Southwest England),
W74-11322 5B

DOMESTIC WASTES
Evaluation of a Multifiltration Water Reclamation Subsystem to Reclaim Domestic Clothes Wash Water,
W74-11029 5D

DRAINAGE
Comparison of the Efficiencies of Vertical and Horizontal Drainage (Sravnitel'naya effektivnost' vertikal'nogo i gorizontalnogo drenazha),
W74-10939 3F

A Long-Time Water-Table Study of an Irrigation Project in Southern Alberta,
W74-11271 3F

DRAINAGE DENSITY
The Random Model in Fluvial Geomorphology,
W74-11035 8B

DRAINAGE INLETS
Hydraulic Performance of Pennsylvania Highway Drainage Inlets Installed in Paved Channels,
W74-11009 8A

DRAINAGE PATTERNS (GEOLOGIC)
The Random Model in Fluvial Geomorphology,
W74-11035 8B

DRAINAGE SYSTEMS
Storm Drainage Systems Design Made Adaptable for Computers,
W74-10916 4A

Hydraulic Performance of Pennsylvania Highway Drainage Inlets Installed in Paved Channels,
W74-11009 8A

DRAWDOWN
Nonlinear Technological Functions for Aquifers Whose Transmissivities Vary with Drawdown,
W74-11424 2F

DREDGING
Maintenance Dredging, New Haven Harbor, Connecticut (Final Environmental Impact Statement).
W74-11140 4C

DRIED POULTRY WASTES
Poultry Anaphage is Here to Stay,
W74-11246 5D

DROPS (STRUCTURES)
Energy Dissipator for Santa Paula Creek, Santa Clara River, California, Hydraulic Model Investigation,
W74-11210 8B

DROUGHT
Free Proline and Water Deficit in Plant Tissues, (in Russian),
W74-11192 2I

DUAL MEDIA FILTERS
Niagara Falls Water Plant Converts Gravity Filters Hydraulically.
W74-10943 5D

DUSTS
Direct Determination of the Total Atmospheric Aerosol Mass Distribution,
W74-10967 5A

The Elemental Composition of the Aerosol in Pasadena, California,
W74-10994 5A

Intercomparison of Several Types of Cascade Impactors,
W74-11008 5A

DYE DISPERSION
New Analytical Solutions for Dye Diffusion Equations,
W74-11021 2E

DYE RELEASES
New Analytical Solutions for Dye Diffusion Equations,
W74-11021 2E

DYE-SENSITIZED PHOTO-OXIDATION
Light Energized Oxidation of Organic Wastes,
W74-10990 5D

DYES
Ozone Treatment of Dye Waste,
W74-11101 5D

DYNAMIC PROGRAMMING
Systems Analysis of a Multi-Stage Tubular Module Reverse Osmosis Plant for Sea Water Desalination,
W74-11039 3A

EARTHWATCH
Evolution of Monitoring for Earthwatch,
W74-10948 5A

ECOLOGICAL ANALYSIS
Problems on Pollution and Water Resources in the New York City Metropolitan Area,
W74-10942 5D

ECOLOGY
Methods for the Direct Determination of Heavy-Metal Pollutants in the Environment,
W74-10923 5A

Oil Pollution and Marine Ecology,
W74-11166 5C

ECONOMIC EFFICIENCY
Preliminary Laboratory Studies of the Decolorization and Bactericidal Properties of Ozone in Pulp and Paper Mill Effluents,
W74-11089 5D

EDWARDS AQUIFER (TX)
Groundwater Discharge from the Edwards and Associated Limestones, San Antonio Area, Texas, 1973,
W74-11440 2F

EFFLUENTS
Characteristics of Zinc Smelting Industrial Waste and Simultaneous Removal of Toxic Elements and Phosphates from It,
W74-11354 5D

EGGS
Effect of Waste Management and Egg Processing on the Flavor of Cooked Eggs,
W74-11236 5C

Investigations on the Toxicity of Sea Water-Extracts of Three Crude Oils on Eggs of Cod (Gadus Morhua L.),
W74-11298 5C

Polychlorinated Biphenyls and P,P' DDE in Green Turtle Eggs from Ascension Island, South Atlantic Ocean,
W74-11335 5C

ELECTRICAL CONDUCTANCE
CTD Sensors, Specific Conductance and the Determination of Salinity,
W74-11033 7B

ELECTRICAL CONDUCTIVITY
Note on Lithium in Saline Groundwaters,
W74-10908 5B

ELECTRODES
Use of Chemical-Sensing Electrodes in Monitoring,
W74-10972 5A

ELECTRODES

Analyses of Paper Machine Waters with Ion-Specific Electrodes. Part I. Effect of pH and Ionic Strength of Solution on Calcium, Cupric, Chloride, Sodium, and Nitrate Ion Specific Electrodes,
W74-11093 5A

Analyses of Paper Machine Waters with Ion-Specific Electrodes, Part II. Calcium, Cupric, Chloride, Sodium and Nitrate Ion Specific Electrode Potentials at Various Temperatures and in Composite Solutions,
W74-11094 5A

ELECTROLYSIS
Pollution Abatement in a Copper Wire Mill.
W74-11383 5D

ELECTRON MICROSCOPY
A Study of the Possibility of Indicating Bacteria in Water by a Spectroultramicroscopic Method, (In Russian),
W74-11121 5A

ELLIPTIC CHANNELS
Varied Flow Functions for Elliptic Channels,
W74-11139 8B

EMBRYONIC GROWTH STAGE
Investigations on the Toxicity of Sea Water-Extracts of Three Crude Oils on Eggs of Cod (Gadus Morhua L.),
W74-11298 5C

The Interaction of Mercury with Cadmium and Zinc in Mammalian Embryonic Development,
W74-11375 5C

ENERGY
Some Current Paper Industry Environmental Protection Problems,
W74-11126 5D

ENERGY DISSIPATION
Energy Dissipator for Santa Paula Creek, Santa Clara River, California, Hydraulic Model Investigation,
W74-11210 8B

ENERGY SOURCES
Digestion Byproduct May Give Answer to Energy Problem,
W74-10935 5D

Water Power Apparatus,
W74-11049 8C

ENGINEERING GEOLOGY
Hydrogeology of the USSR. Volume 29: Kamchatka, and the Kuril and Komandorskiye Islands (Gidrogeologiya SSSR. Tom XXIX. Kamchatka, Kuril'skiye i Komandorskiye ostrova).

ENGRAULIS MORDAX
Free Amino Acid Variations in the Anchovy, Engraulis Mordax (Girard) from the Los Angeles Coastal Area,
W74-11294 5C

ENTEROVIRUS
The Use of Magnetic Iron Oxide for Recovery of Virus From Water,
W74-10905 5D

ENVIRONMENT
Evolution of Monitoring for Earthwatch,
W74-10948 5A

The Assessment of Environmental Impact--Water Quality and Quality Assurance Considerations,
W74-10952 5A

Assessment of Selected Rann Environmental Modelling Efforts,
W74-11038 6A

ENVIRONMENTAL ENGINEERING
Urbanization and the Environment--Engineering Implications,
W74-11124 4C

ENVIRONMENTAL IMPACT STATEMENTS
The Assessment of Environmental Impact--Water Quality and Quality Assurance Considerations,
W74-10952 5A

Maintenance Dredging, New Haven Harbor, Connecticut (Final Environmental Impact Statement).
W74-11140 4C

Judicial Review of Administrative Decisions Under the National Environmental Policy Act of 1969,
W74-11141 6E

Moorhead Bayou Watershed, Sunflower County, Mississippi (Final Environmental Impact Statement).
W74-11143 6E

Tombigbee River (East Fork), Itawamba County, Mississippi. Operation and Maintenance.
W74-11144 4A

Environmental Defense Fund V. Froehlke (Restraining Order Under Nepa).
W74-11146 6E

ENVIRONMENTAL MODELING
Assessment of Selected Rann Environmental Modelling Efforts,
W74-11038 6A

ENVIRONMENTAL PROTECTION
Protection of the Environment During Demolition Activities,
W74-11208 5G

ENVIRONMENTAL QUALITY
A Seasonal Survey of the Fishes in the Mystic River, a Polluted Estuary in Downtown Boston, Massachusetts,
W74-11302 5B

EPIDEMICS
Water-Borne Transmission of Chloramphenicol-Resistant Salmonella typhi in Mexico,
W74-10906 5C

EPOXY RESINS
Epoxy Tar Lines Birmingham's Trunk,
W74-10920 8A

EQUATIONS
New Analytical Solutions for Dye Diffusion Equations,
W74-11021 2E

The Integration of System Identification and System Optimization,
W74-11042 6A

EQUIPMENT
Vacuum Filtration of Sludge,
W74-11084 5D

ERIPHIA SPINIFRONS
The Effect of Heavy Metal on Protein Synthesis in Crustaceans and Fish,
W74-11295 5C

EROSION
Erosional and Depositional Aspects of Hurricane Camille in Virginia, 1969,
W74-11233 2J

EROSION RATES
Erodibility of Soils Under Storm Runoff Conditions (Erodiruyemost' pochv v usloviyakh livnevogo stoka),
W74-11449 2J

ESCHERICHIA COLI
The Influence of Certain Toxic Substances, Contained in Domestic Wastes, on the Bacteria Escherichia Coli and Pseudomonas Flourescens, (L'Influence De Certaines Substances Toxiques, Contenues Dans Les Eaux D'egouts Municipaux, Sur Les Bacteries Escherichia Coli Et Pseudomonas Flourescens),
W74-11301 5C

ESTIMATING
A Scheme for Assessing the Reliability of Interpolated Rainfall Estimates,
W74-10941 2B

ESTROGENS
Fecal Elimination of Estrogens by Cattle Treated with Diethylstilbestrol and Hexestrol,
W74-11245 5B

ESTUARIES
A National Overview of Existing Coastal Water Quality Monitoring.
W74-11010 5A

Reproduction of the Bloodworm (Glycera dibranchiata) in the Sheepscot Estuary, Maine,
W74-11043 2L

Well-Mixed Estuaries with Nonlinear Resistance,
W74-11137 2L

Adaptation of the Polychaete Nereis Diversicolor to Estuarine Sediments Containing High Concentrations of Zinc and Cadmium,
W74-11337 5C

Adaptation of the Polychaete Nereis Diversicolor to Manganese in Estuarine Sediments,
W74-11338 5C

Copper Content in the Inshore and Estuarine Waters Along the Central West Coast of India,
W74-11358 5B

Monitoring Toxaphene Contamination in a Georgia Estuary,
W74-11443 5B

EUTROPHICATION
The Phosphorus Status of Eutrophic Lake Sediments as Related to Changes in Limnologi-

cal Conditions--Total, Inorganic and Organic Phosphorus,
W74-11131 5C

The Influence of the Eutrophic Process of Waters by Eroded Soil Material, (In German),
W74-11207 5C

Influence of Organic Pollution on Lake Mariut, A Highly Eutrophicated Lake South of Alexandria,
W74-11283 5C

The Flagellata Examined From Polluted Water of the Inland Sea, Setonaikai,
W74-11342 5C

Eutrophication: Recent Directions for New Perspectives,
W74-11357 5C

EVALUATION
Numerical Indices Applied to the Results of a Survey of the Macro-Invertebrate Fauna of the Tamar Catchment (Southwest England),
W74-11322 5B

EVAPORATION
Evaporation of Water from Sand, 3: The Loss of Water into the Atmosphere from a Sandy River Bed Under Arid Climatic Conditions,
W74-11266 2D

Evaporation of Water from Sand, 4: The Influence of the Depth of the Water-Table and the Particle Size Distribution of the Sand,
W74-11267 2D

Evaporating Method and Evaporating Apparatus,
W74-11396 3A

Multiple Effect Evaporating Apparatus,
W74-11401 3A

Evaporating Method and Apparatus,
W74-11402 3A

Rate of Evaporation of Water From Capillaries of Different Diameter Into Moist Air (Skorost' ispareniya vody iz kapillyarov raznykh diametrov vo vlazhnyy vozdukh),
W74-11448 2D

EVAPORATORS
Multistage Evaporator,
W74-11050 3A

Evaporating Method and Evaporating Apparatus,
W74-11396 3A

Multiple Effect Evaporating Apparatus,
W74-11401 3A

EVAPOTRANSPIRATION
Evaporation of Water from Sand, 3: The Loss of Water into the Atmosphere from a Sandy River Bed Under Arid Climatic Conditions,
W74-11266 2D

A Weighing System for Lysimeters,
W74-11277 2D

EXPLOSIVES
Protection of the Environment During Demolition Activities,
W74-11208 5G

EXTRACTION
Analysis of Organic Mercury Compounds by Gas Chromatography,
W74-11390 5A

EXUDATION
An Alternative Explanation for the Apparently Active Water Exudation in Excised Roots,
W74-11072 3F

FACILITIES
Offshore Airports Ease Environmental Problems,
W74-11127 6G

FALLOWING
Crop Residue, Soil Water, and Soil Fertility Related to Spring Wheat Production and Quality After Fallow,
W74-11264 3F

FARM WASTES
Agricultural Waste Water Accommodation and Utilization by Various Forages,
W74-10903 5D

Effect of Waste Management and Egg Processing on the Flavor of Cooked Eggs,
W74-11236 5C

Three Tons is All You Get.

Effect of Cattle Feedlot Volatiles, Aliphatic Amines, on Chlorella Ellipsoidea Growth,
W74-11238 5C

Effects of Spreading Manure on Groundwater and Surface Runoff,
W74-11240 5B

A Beef Confinement Building with an Oxidation Ditch,
W74-11241 5D

Soil Columns for Simulating Animal Manure Recycling,
W74-11242 5D

Reducing Labor During Broiler Growout,
W74-11243 5D

More Beef on the Hoof Goal of Ohio Research.
W74-11244 5D

Fecal Elimination of Estrogens by Cattle Treated with Diethylstilbestrol and Hexestrol,
W74-11245 5B

Poultry Anaphage is Here to Stay,
W74-11246 5D

FAYETTE COUNTY (KY)
The Hydrology of the Lexington and Fayette County, Kentucky Area,
W74-11201 4A

FEDERAL PROJECT POLICY
Judicial Review of Administrative Decisions Under the National Environmental Policy Act of 1969,
W74-11141 6E

FEDERAL WATER POLLUTION CONTROL ACT
NPDES Self-Monitoring and Reporting Requirements,
W74-10970 5G

FEED LOTS
Effect of Cattle Feedlot Volatiles, Aliphatic Amines, on Chlorella Ellipsoidea Growth,
W74-11238 5C

Aerobic Treatment of Feedlot Runoff,
W74-11281 5D

FEEDING BEHAVIOR
Effects of Crude Oil on the Feeding Behavior of the Lobster Homarus Americanus,
W74-11333 5C

FEEDING RATES
Effects of Crude Oil on the Feeding Behavior of the Lobster Homarus Americanus,
W74-11333 5C

FEEDS
Poultry Anaphage is Here to Stay,
W74-11246 5D

FERMENTATION
A Novel Device for Improved Air and Liquid Mixing (Ujtipusu Keszulek Folyadekok Erintkeztetesere es Keveresere Levegovel),
W74-11116 5D

FERTILITY
Determination of Total Phosphorous in Soils: A Rapid Perchloric Acid Digestion Procedure,
W74-11273 2G

FERTILIZERS
Crop Residue, Soil Water, and Soil Fertility Related to Spring Wheat Production and Quality After Fallow,
W74-11264 3F

FIBERS (PLANT)
Float Wash Clarifies White Water for Paper Machine Re-use,
W74-11091 5D

FILMS
Rate of Evaporation of Water From Capillaries of Different Diameter Into Moist Air (Skorost' ispareniya vody iz kapillyarov raznykh diametrov vo vlazhnyy vozdukh),
W74-11448 2D

FILTERS
Niagara Falls Water Plant Converts Gravity Filters Hydraulically.
W74-10943 5D

Effluent Polishing with a Biological Filter,
W74-11081 5D

Vacuum Filtration of Sludge,
W74-11084 5D

Pilot Plant Studies of Turbidity and Residual Cell Material Removal from Mill Effluents by Granular Media Filtration,
W74-11088 5D

Pollution: Filters for Localized Purification (Pollution: des filtres pour une epuration localisee).
W74-11098 5D

Possibilities of Using Chemical-Physical Purification Process for Waste Waters (Einsatzmoeglichkeiten chemischphysikalischer Reinigungsverfahren bei Restabwaessern),
W74-11099 5D

Hygienic Evaluation of a Portable Ion Exchange Filter For Field Purification of Drinking Water, (In Russian),
W74-11175 5F

Purification of Water Polluted with DDT and Hexachlorocyclohexane,
W74-11183 5D

Oil-Water Regenerative Separator--Final Report of Phase I Development Program of a

Continuous Regenerating Moving Bed to Remove Oil from Oil-Water Suspensions,
W74-11225 5D

Application of Biological Filters in Water Treatment Systems.
W74-11418 5D

FILTRATION
Direct-Filtration Studies for Metropolitan Toronto,
W74-10928 5D

Niagara Falls Water Plant Converts Gravity Filters Hydraulically.
W74-10943 5D

Method of Investigation of Nonlinear Filtration Effects (O metodike issledovaniya nelineynykh fil'tratsionnykh effektov),
W74-11016 7B

Evaluation of a Multifiltration Water Reclamation Subsystem to Reclaim Domestic Clothes Wash Water,
W74-11029 5D

Filter Systems,
W74-11044 5C

Effluent Polishing with a Biological Filter,
W74-11081 5D

Vacuum Filtration of Sludge,
W74-11084 5D

Pilot Plant Studies of Turbidity and Residual Cell Material Removal from Mill Effluents by Granular Media Filtration,
W74-11088 5D

Pollution: Filters for Localized Purification (Pollution: des filtres pour une epuration localisee).
W74-11098 5D

Possibilities of Using Chemical-Physical Purification Process for Waste Waters (Einsatzmoeglichkeiten chemischphysikalischer Reinigungsverfahren bei Restabwaessern),
W74-11099 5D

Prototype Study of Microstraining at a Paper Mill Complex,
W74-11104 5D

Treatment of Alkali Extraction Effluents by Ultrafiltration (Traitement des effluents de sodation par ultrafiltration),
W74-11114 5D

A Study on the Fractionation of Organic Matter in Natural Water by Ultrafiltration Techniques,
W74-11187 2K

Oil-Water Regenerative Separator--Final Report of Phase I Development Program of a Continuous Regenerating Moving Bed to Remove Oil from Oil-Water Suspensions,
W74-11225 5D

Water Treatment Filter Bed for Sewage Systems,
W74-11405 5D

Application of Biological Filters in Water Treatment Systems.
W74-11418 5D

Filter Pore-Size Effects on the Analysis of Al, Fe, Mn, and Ti in Water,
W74-11421 5A

FINITE ELEMENT ANALYSIS
A Finite Element Approach to Watershed Runoff,
W74-10937 2A

Galerkin Approximation of the Time Derivative in the Finite Element Analysis of Groundwater Flow,
W74-11423 2F

FINLAND
Special Water for Special Paper.
W74-11113 5F

FISH
Fish Toxicity Survey of Four Prairie Province Pulp Mill Effluents,
W74-11075 5C

Laboratory and Controlled Experimental Stream Studies of the Effects of Kraft Effluents on Growth and Production of Fish,
W74-11087 5C

Potential Effects of Thermal Discharges on Aquatic Systems,
W74-11107 5C

Coughing Fish May Monitor Water Quality.
W74-11257 5A

Mercury Pollution,
W74-11368 5B

Effects of Regulatory Guidelines of the Intake of Mercury from Fish - the MECCA Project,
W74-11372 5C

The Determination of Mercury in Commercially Important Aquatic Organisms,
W74-11438 5A

FISH AGE
Trace Metals in Lake Cayuga Lake Trout (Salvelinus Namaycush) in Relation to Age,
W74-11336 5C

FISH BEHAVIOR
Factors Affecting Acute Toxicity Bioassays with Pulp Mill Effluent,
W74-11076 5C

FISH CONSUMPTION
Methylmercury Exposure, Mercury Levels in Blood and Hair, and Health Status in Swedes Consuming Contaminated Fish,
W74-11330 5B

FISH DISEASES
Carcinogenic Sources in Fish Tumors Found in the Fox Valley Water Shed,
W74-11006 5C

FISH EGGS
Chlorinated Insecticide Residues in the Eggs of Some Freshwater Fish,
W74-11323 5C

FISH MANAGEMENT
Determination of the Hematocrit Value of Carp and Its Influencing with Cobalt, (Stanoveni Hematodritove Hodnoty Kapru a Jeji Ovlivneni Kobaltem),
W74-11316 5C

FISH MIGRATION
Connecticut River Ecological Study--A Study of the Rate and Pattern of Shad Migration in the Connecticut River--Utilizing Sonic Tracking Apparatus,
W74-11227 8I

FISH PARASITES
Energetics of a Host-Parasite Relationship as Illustrated by the Leech Malmiana nuda, and the Shorthorn Sculpin Myoxocephalus scorpius,
W74-10940 5C

FISH PHYSIOLOGY
Experiments in the Nutrition of Carp Growing in Cages,
W74-11190 2H

Determination of the Hematocrit Value of Carp and Its Influencing with Cobalt, (Stanoveni Hematodritove Hodnoty Kapru a Jeji Ovlivneni Kobaltem),
W74-11316 5C

FISH TUMORS
Carcinogenic Sources in Fish Tumors Found in the Fox Valley Water Shed,
W74-11006 5C

FLAME PHOTOMETRY
The Carbon Rod Atomic Absorption Analysis of Arsenic in Plant and Animal Tissues,
W74-10985 5A

Evaluation of Digestion Techniques for the AAS Determination of Metal Concentrations in Kelp,
W74-10986 5A

Determination of Trace Metals in Sodium Dithionite-Citrate Extracts of Soils and Sediments by Atomic Absorption,
W74-11425 5A

FLAVOR
Effect of Waste Management and Egg Processing on the Flavor of Cooked Eggs,
W74-11236 5C

FLINT (MI)
Sewer-Within-Sewer Saves City $400,000,
W74-10921 5D

FLOATING SLUDGE
Inverse Separation of Heat-Treated Sludge,
W74-11249 5D

FLOCCULATION
Direct-Filtration Studies for Metropolitan Toronto,
W74-10928 5D

Conversion of Sven-Pedersen Flotation Units into a Horizontal Scraper Conveyor-Sedimentation Unit at the Miziya Pulp and Paper Mill (Nyakoi tekhnicheski soobrazheniya po preustroivaneto na flotatsionnite kletki 'Sven Pedersen' v K.Ts.Kh. (Kombinat Tseluloza i Khartiya) Miziya za rabota kato khorizontalni skrebkovi utaiteli),
W74-11073 5D

Flocculation and Decantation of Paper Industry Waste Waters (Floculation et decantation pes eaux residuaires de papeterie),
W74-11080 5D

Possibilities of Using Chemical-Physical Purification Process for Waste Waters (Einsatzmoeglichkeiten chemischphysikalischer Reinigungsverfahren bei Restabwaessern),
W74-11099 5D

Flocculation of Aqueous Quartz Suspensions with Neutral and Cationic Polymers in the Presence of Co(II), Ca(II), or Fe(III),
W74-11235 5D

Sewage Flocculating and Sedimentation Tank Unit,
W74-11410 5D

ONSIL
Chlorinated Insecticide Residues in the Eggs of Some Freshwater Fish,
W74-11323 5C

OOD CONTROL
Special Flood Hazard Information Report, Ochlockonee River, Florida, Lake Talquin to Allen Landing.
W74-11155 6F

OOD FREQUENCY

Catalog of USSR Glaciers. Volume 15. Altay and West Siberia. No. 1. Gornyy Altay and Upper Irtysh. Part 6. Chuya River Basin (Katalog lednikov SSSR. Tom 15. Altay i Zapadnaya Sibir'. Vypusk 1. Gornyy Altay i Verkhniy Irtysh. Chast' 6. Basseyn r. Chui),
W74-11214 2C

Catalog of USSR Glaciers. Volume 14. Soviet Central Asia. No. 3. Amu-Dar'ya. Part 6. Surkhob River Basin Between Mouths of the Obikhingou and Muksu Rivers (Katalog lednikov SSSR. Tom 14. Srednyaya Aziya. Vypusk 3. Amu-Dar'ya. Chast' 6. Basseyn r. Surkhob mezhdu ust'yami rek Obikhingou i Muksu),
W74-11215 2C

Catalog of USSR Glaciers. Volume 8. Northern Caucasus. Part 6. Chegem River Basin. Part 7. Cherek River Basin(Katalog lednikov SSSR. Tom 8. Severnyy Kavkaz. Chast' 6. Basseyn r. Chegema. Chast' 7. Basseyn r. Chereka),
W74-11216 2C

Catalog of USSR Glaciers. Volume 14. Soviet Central Asia. No 1. Syrdar'ya. Part 4. (Katalog lednikov SSSR. Tom 14. Srednyaya Aziya. Vypusk 1. Syrdar'ya. Chast' 4.),
W74-11217 2C

Catalog of USSR Glaciers. Volume 17. Lena-Indigirka Region. No. 2. Middle Lena. Part 1; No. 5. Lower Lena. Part 2. (Katalog lednikov SSSR. Tom 17. Lensko-Indigirskiy rayon. Vypusk 2. Srednyaya Lena. Chast' 1; Vypusk 5. Nizhnyaya Lena. Chast' 2.),
W74-11218 2C

Catalog of USSR Glaciers. Volume 14. Soviet Central Asia. No. 2. Kirgizia. Part 3. Basin in Upper Reaches of the Chu River (Katalog lednikov SSSR. Tom 14. Srednyaya Aziya. Vypusk 2. Kirgiziya. Chast' 3. Basseyn verkhov'yev r. Chu),
W74-11219 2C

Catalog of USSR Glaciers. Volume 14. Soviet Central Asia. No. 1. Syrdar'ya. Part 6. Atbashi River Basin (Katalog lednikov SSSR. Tom 14. Srednyaya Aziya. Vypusk 1. Syrdar'ya. Chast' 6. Basseyn r. Atbashi),
W74-11220 2C

Catalog of USSR Glaciers. Volume 14. Soviet Central Asia. No. 2. Kirgizia. Part 2. Basins of Left-Bank Tributaries of the Chu River Downstream from Mouth of the Komorchek River (Katalog lednikov SSSR. Tom 14. Srednyaya Aziya. Vypusk 2. Kirgiziya. Chast' 2. Basseyny levykh pritokov r. Chu nizne ustya r. Komorchek),
W74-11221 2C

Evaluation of Glacier Mass Balance by Observing Variations in Transient Snowline Positions,
W74-11437 2C

GLACIOHYDROLOGY
Glaciohydroclimatology of Mountainous Countries (Glyatsiogidroklimatologiya gornykh stran).
W74-11446 2C

GLACIOLOGY
Glaciohydroclimatology of Mountainous Countries (Glyatsiogidroklimatologiya gornykh stran).
W74-11446 2C

GONIOTRICHUM ALSIDII
Growth Stimulation of Axenic Red Algae By Simple Phenolic Compounds,
W74-11346 5C

GORNO-ALTAYSK AUTONOMOUS OBLAST (USSR)
Catalog of USSR Glaciers. Volume 15. Altay and West Siberia. No. 1. Gornyy Altay and Upper Irtysh. Part 6. Chuya River Basin (Katalog lednikov SSSR. Tom 15. Altay i Zapadnaya Sibir'. Vypusk 1. Gornyy Altay i Verkhniy Irtysh. Chast' 6. Basseyn r. Chui),
W74-11214 2C

GOVERNMENTS
Focus on Control of Water Pollution in Sao Paulo State and its Relationship to the Pulp and Paper Industries (Enfoque do controle de poluicoa das aguas no estado de Sao Paulo e seu relacionamento com as industrias de celulose e papel),
W74-11090 5D

GRADUALLY VARIED FLOW
Varied Flow Functions for Elliptic Channels,
W74-11139 8B

GRASSES
Effect of Different Levels of N-Nutrition of Grass Species Upon their Persistency, Hay Production and the Content of N-Matter on Temporary Swamp Sites, (In Czech),
W74-11108 2G

GRASSLANDS
Moisture Regime of Meadow Soils on the Oka River Flood Plain (Rezhim vlazhnosti poymennykh pochv okskikh lugov),
W74-11204 2G

GRAVITY
Niagara Falls Water Plant Converts Gravity Filters Hydraulically.
W74-10943 5D

GREAT LAKES
Mercury Pollution,
W74-11368 5B

GROUNDWATER
Comparison of the Efficiencies of Vertical and Horizontal Drainage (Sravnitel'naya effektivnost' vertikal'nogo i gorizontalnogo drenazha),
W74-10939 3F

Hydrogeology of the USSR. Volume 15: Bashkir ASSR (Gidrogeologiya SSSR. Tom XV. Bashkirskaya ASSR).
W74-11017 2F

Hydrogeology of the USSR. Volume 29: Kamchatka, and the Kuril and Komandorskiye Islands (Gidrogeologiya SSSR. Tom XXIX. Kamchatka, Kuril'skiye i Komandorskiye ostrova).
W74-11018 2F

Hydrogeology of the USSR. Volume 38: Turkmen SSR (Gidrogeologiya SSSR. Tom XXXVIII. Turkmenskaya SSR).
W74-11019 2F

Hydrogeology of the USSR. Volume 40: Kirgiz SSR (Gidrogeologiya SSSR. Tom XL. Kirgizskaya SSR).
W74-11020 2F

Availability of Groundwater in the Lower Pawcatuck River Basin, Rhode Island,
W74-11023 4B

Groundwater Basic Data for Adams and Bowman Counties, North Dakota,
W74-11024 2F

Water Levels in Artesian and Nonartesian Aquifers of Florida, 1971-72,
W74-11025 4A

The Hydrology of the Lexington and Fayette County, Kentucky Area,
W74-11201 4A

Effects of Spreading Manure on Groundwater and Surface Runoff,
W74-11240 5B

A Long-Time Water-Table Study of an Irrigation Project in Southern Alberta,
W74-11271 3F

Legal Controls of Pollution in the Great Lakes Basin,
W74-11417 5G

Prospects of Groundwater Use in the Neman and Neris River Valleys (Perspektivy ispol'zovaniya podzemnykh vod rechnykh dolin Nyamunas i Neris),
W74-11447 4B

GROUNDWATER AVAILABILITY
Availability of Groundwater in the Lower Pawcatuck River Basin, Rhode Island,
W74-11023 4B

GROUNDWATER BASINS
Hydrogeology of the USSR. Volume 15: Bashkir ASSR (Gidrogeologiya SSSR. Tom XV. Bashkirskaya ASSR).
W74-11017 2F

Hydrogeology of the USSR. Volume 38: Turkmen SSR (Gidrogeologiya SSSR. Tom XXXVIII. Turkmenskaya SSR).
W74-11019 2F

GROUNDWATER MOVEMENT
Hydrologic Engineering Methods for Water Resources Development: Volume 10. Principles of Ground-Water Hydrology,
W74-11232 8B

Galerkin Approximation of the Time Derivative in the Finite Element Analysis of Groundwater Flow,
W74-11423 2F

Digital Modeling of Radioactive and Chemical Waste Transport in the Snake River Plain Aquifer at the National Reactor Testing Station, Idaho,
W74-11439 5B

GROUNDWATER RESOURCES
Hydrogeology of the USSR. Volume 40: Kirgiz SSR (Gidrogeologiya SSSR. Tom XL. Kirgizskaya SSR).
W74-11020 2F

GROUPER
DDT, DDE, and PCBs In the Tissues of Reef Dwelling Groupers (Serranidae) In the Gulf of Mexico and the Grand Bahamas,
W74-11347 5B

GROWTH RATES
The Growth Kinetics of Isochrysis Galbana in Cultures Containing Sublethal Concentrations of Mercuric Chloride,
W74-11340 5C

GROWTH STIMULATION VANILLIN
Growth Stimulation of Axenic Red Algae By Simple Phenolic Compounds,
W74-11346 5C

GULF OF MEXICO
DDT, DDE, and PCBs In the Tissues of Reef Dwelling Groupers (Serranidae) In the Gulf of Mexico and the Grand Bahamas,
W74-11347 5B

GULF OF TRIESTE
Typical Level of Lead in Mytilus Galloprovincialis LMK From The Gulf of Trieste,
W74-11290 5B

HABITATS
Resistance and Respiratory Physiology of Intertidal Meiofauna to Oxygen-Deficiency,
W74-11309 5C

HARBORS
Long Wave Excitation in Harbours--An Analytical Study,
W74-11031 8B

Maintenance Dredging, New Haven Harbor, Connecticut (Final Environmental Impact Statement).
W74-11140 4C

HARDNESS (WATER)
Effect of Water Hardness on the Toxicity of an Anionic Detergent to Fish,
W74-11310 5C

The Toxicity of Zinc Sulphate to Rainbow Trout in Very Hard Water,
W74-11321 5C

HAWAII
Effects of Heated Effluent on Hermatypic Corals at Kahe Point, Oahu,
W74-11303 5C

HEAT EXCHANGE
Distillation of Saline Water by Direct Contact Heat Exchange with Immiscible Liquid,
W74-11414 3A

HEAT FLOW RATIO
Localized Thermal Pollution in Shallow Streams, (Near-Field Temperature Distributions),
W74-10902 5B

HEAT TRANSFER
Distillation of Saline Water by Direct Contact Heat Exchange with Immiscible Liquid,
W74-11414 3A

HEAT TREATMENT
Frost Protection for Waterlines.
W74-10910 8C

Inverse Separation of Heat-Treated Sludge,
W74-11249 5D

The Effect of Heat Treatment on the Solubilization of Heavy Metals, Solids and Organic Matter From Digested Sludge,
W74-11250 5D

HEATED WATER
Localized Thermal Pollution in Shallow Streams, (Near-Field Temperature Distributions),
W74-10902 5B

Policy For Location of Power Plants in Coastal Areas,
W74-11145 6G

Effects of Heated Effluent on Hermatypic Corals at Kahe Point, Oahu,
W74-11303 5C

HEATER STRIP
Frost Protection for Waterlines.
W74-10910 8C

HEAVY METALS
Methods for the Direct Determination of Heavy-Metal Pollutants in the Environment,
W74-10923 5A

Transmethylation of Heavy Metal Ions in Water,
W74-10983 5B

Carbon-Monoxide-Induced Particles from Hopcalite Catalyst,
W74-10998 5B

Reverse Osmosis Separation of Some Heavy Metallic Salts in Aqueous Solution (in Japanese),
W74-11105 5D

The Effect of Heat Treatment on the Solubilization of Heavy Metals, Solids and Organic Matter From Digested Sludge,
W74-11250 5D

Use of Neritic Trophodynamic Chain of Molluscs for the Study of the Transfer of Metallic Pollutants, (Utilisation D'une Chaine Trophodynamique De Type Neritique A Mollusques Pour L'etude Des Transferts Des Polluants Metalliques),
W74-11287 5C

HEAVY METALS

The Effect of Heavy Metal on Protein Synthesis in Crustaceans and Fish,
W74-11295 5C

Ecological Implications of Heavy Metal in Fish from the Severn Estuary,
W74-11325 5C

Sublethal Effects of Several Metallic Salts-Organic Compounds Combinations Upon the Heterotrophic Microflora of a Natural Water,
W74-11352 5C

The Vanadium and Selected Metal Contents of Some Ascidians,
W74-11353 5A

Heavy Metal Removal From Wastewater Treatment Plant By Chemical Treatment,
W74-11359 5D

HEMATOCRIT

Determination of the Hematocrit Value of Carp and Its Influencing with Cobalt, (Stanoveni Hematodritove Hodnoty Kapru a Jeji Ovlivneni Kobaltem),
W74-11316 5C

HEMOGLOBIN SYNTHESIS

The Effect of Heavy Metal on Protein Synthesis in Crustaceans and Fish,
W74-11295 5C

HEPTACHLOR

Chlorinated Insecticide Residues in the Eggs of Some Freshwater Fish,
W74-11323 5C

HERDER

Toxicity Study of Two Oil Spill Reagents Toward Hudson River Fish Species,
W74-11344 5C

HERMATYPIC CORAL

Effects of Heated Effluent on Hermatypic Corals at Kahe Point, Oahu,
W74-11303 5C

HETEROSIGMA SP

Studies on the Mechanisms of Red Tide Occurrence in Hakata Bay, 3. The Characteristics of Effective Bottom Mud and Its Geographical Distribution Pattern, (In Japanese),
W74-11341 5C

HETEROTROPHS

Ecological Studies in Artificial Streams. III. The Seasonal Change in the Relationship of Heterotroph to Phototrophic Biomasses in Different Sewage Concentrations, (Okologische Untersuchungen an Modellfliessgewassern. III. Die Jahreszeitlichen Veranderungen im Verhaltnis Von Heterotropher Zu Phototropher Biomasse Bet Verschiedenen Abwasserblastungen),
W74-11317 5C

Ecological Studies in Artificial Streams. IV. Self Purification and Biomass Production in a Domestic Sewage Gradient, (Okologische Untersuchungen an Modelleliessgewassern. IV. Auswirkung der Selbsteinigung auf die Biomassebildung in Einem Abwassergradienten),
W74-11318 5C

HEXACHLOROBENZENE

Hexachlorobenzene (HCB) Residues in Fish,
W74-11331 5C

HEXESTROL

Fecal Elimination of Estrogens by Cattle Treated with Diethylstilbestrol and Hexestrol,
W74-11245 5B

HIGHWAY REST AREAS

Feasibility of Water Reuse at Highway Rest Stations,
W74-11134 5D

HIGHWAYS

North Cascades Highway SR-20 Avalanche Atlas,
W74-11226 2C

Avalanches on the North Cascades Highway (SR-20)--Summary Report,
W74-11444 2C

HISTORY

Inspection of New Treatment Facilities, the Rockville Water and Aqueduct Company,
W74-10909 5F

Historical Development of Water Pollution Control Cost Functions,
W74-11102 5G

Pierre Perrault: The Man and His Contribution to Modern Hydrology,
W74-11206 2A

HOADLEY CREEK (AK)

Flood Plain Information, Hoadley Creek, Ketchikan, Alaska.
W74-11427 4A

HOMARUS AMERICANUS

Effects of Crude Oil on the Feeding Behavior of the Lobster Homarus Americanus,
W74-11333 5C

HOST-PARASITE RELATIONSHIPS

Energetics of a Host-Parasite Relationship as Illustrated by the Leech Malmiana nuda, and the Shorthorn Sculpin Myoxocephalus scorpius,
W74-10940 5C

HUDSON RIVER

Toxicity Study of Two Oil Spill Reagents Toward Hudson River Fish Species,
W74-11344 5C

HUMAN DISEASES

Water-Borne Transmission of Chloramphenicol-Resistant Salmonella typhi in Mexico,
W74-10906 5C

HUMAN PATHOLOGY

Methylmercury Exposure, Mercury Levels in Blood and Hair, and Health Status in Swedes Consuming Contaminated Fish,
W74-11330 5B

Interrelationship of Biochemical Responses to the Absorption of Inorganic Lead,
W74-11362 5C

Trace Elements: A Growing Appreciation of Their Effects on Man,
W74-11395 5C

HUMAN PHYSIOLOGY

Effects of Regulatory Guidelines of the Intake of Mercury from Fish - the MECCA Project,
W74-11372 5C

HUMAN POPULATION

Urbanization and the Environment--Engineering Implications,
W74-11124 4C

HUMIC ACIDS

Coal Humates for the Removal of Water Pollutants Associated With the Use of Coal,
W74-10993 5D

HURRICANE CAMILLE (1969)

Erosional and Depositional Aspects of Hurricane Camille in Virginia, 1969,
W74-11233 2J

HURRICANES

Erosional and Depositional Aspects of Hurricane Camille in Virginia, 1969,
W74-11233 2J

HYDRAULIC MODELS

The Use of Standard Bodies to Measure the Cavitation Strength of Water,
W74-11034 8B

Energy Dissipator for Santa Paula Creek, Santa Clara River, California, Hydraulic Model Investigation,
W74-11210 8B

Lock and Dam No. 8, Arkansas River Navigation Project, Hydraulic Model Investigation,
W74-11211 8B

HYDRAULIC STRUCTURES

Smoke Testing Pinpoints Surface Water Inflow,
W74-11082 8A

HYDROCARBONS

Ocean Incineration of Toxic Wastes.
W74-11132 5E

HYDROGEN ION CONCENTRATION

The Concentration Control of Soluble Copper in a Mine Tailings Stream,
W74-11361 5B

HYDROGEOLOGY

Hydrogeology of the USSR. Volume 15: Bashkir ASSR (Gidrogeologiya SSSR. Tom XV. Bashkirskaya ASSR).
W74-11017 2F

Hydrogeology of the USSR. Volume 29: Kamchatka, and the Kuril and Komandorskiye Islands (Gidrogeologiya SSSR. Tom XXIX. Kamchatka, Kuril'skiye i Komandorskiye ostrova).
W74-11018 2F

Hydrogeology of the USSR. Volume 38: Turkmen SSR (Gidrogeologiya SSSR. Tom XXXVIII. Turkmenskaya SSR).
W74-11019 2F

Hydrogeology of the USSR. Volume 40: Kirgiz SSR (Gidrogeologiya SSSR. Tom XL. Kirgizskaya SSR).
W74-11020 2F

Pierre Perrault: The Man and His Contribution to Modern Hydrology,
W74-11206 2A

Hydrogeology of Glacial Drift, Mesabi Iron Range, Northeastern Minnesota,
W74-11222 2F

Hydrologic Engineering Methods for Water Resources Development: Volume 10. Principles of Ground-Water Hydrology,
W74-11232 8B

Prospects of Groundwater Use in the Neman and Neris River Valleys (Perspektivy ispol'zovaniya podzemnykh vod rechnykh dolin Nyamunas i Neris),
W74-11447 4B

YDROLOGIC ASPECTS
Comparison of the Efficiencies of Vertical and Horizontal Drainage (Sravnitel'naya effektivnost' vertikal'nogo i gorizontalnogo drenazha),
W74-10939 3F

YDROLOGIC DATA
Groundwater Basic Data for Adams and Bowman Counties, North Dakota,
W74-11024 2F

Data Bank Inventory: Vol. II--Chesapeake Bay, Edition 1, 1949 Through 1970,
W74-11026 2L

Water Data -- A New Awareness,
W74-11205 7C

YDROLOGIC ENGINEERING
Hydrologic Engineering Methods for Water Resources Development: Volume I, Requirements and General Procedures,
W74-11231 8B

YDROLOGY
Pierre Perrault: The Man and His Contribution to Modern Hydrology,
W74-11206 2A

Hydrologic Engineering Methods for Water Resources Development: Volume I, Requirements and General Procedures,
W74-11231 8B

YDROMETEOROLOGY
The Effect of Hydrometeorological Conditions on the Zeta-Potential of Suspended Solids (Hidrometeorologiai viszonyok hatasa a lebego anyagok Zeta-potencialjara),
W74-10907 5B

YDROPONIC CULTURE
Zinc Toxicity in Hydroponic Culture,
W74-11045 5C

YDROPONICS
Experimental Hydroponic Gardening with Municipal Waste Water,
W74-10917 5D

YGROMETRY
Methodology of Plant Tissue Water Potential Determination by the Psychrometric Method,
W74-11188 2I

'E
Method of Clearing a Path Through Ice,
W74-11051 8C

Investigation and Calculation of Ice Jams (Issledovaniye i raschety zatorov i zazhorov l'da).
W74-11445 2C

CE BREAKUP
Method of Clearing a Path Through Ice,
W74-11051 8C

CE COVER
Investigation and Calculation of Ice Jams (Issledovaniye i raschety zatorov i zazhorov l'da).
W74-11445 2C

CE JAMS
Investigation and Calculation of Ice Jams (Issledovaniye i raschety zatorov i zazhorov l'da).
W74-11445 2C

CE-WATER INTERFACES
Method of Clearing a Path Through Ice,
W74-11051 8C

ICHTHYOTOXICITY
Ichthyotoxic Effects of Some Anti-Pollution Products,
W74-11327 5C

IDAHO
Digital Modeling of Radioactive and Chemical Waste Transport in the Snake River Plain Aquifer at the National Reactor Testing Station, Idaho,
W74-11439 5B

ILLINOIS
Carcinogenic Sources in Fish Tumors Found in the Fox Valley Water Shed,
W74-11006 5C

Causes for Precipitation Increases in the Hills of Southern Illinois,
W74-11138 2B

INCINERATION
Decolorization of Bleach Plant Effluent and Chloride Handling,
W74-11092 5D

Ocean Incineration of Toxic Wastes.
W74-11132 5E

INDIA
Characteristics of Zinc Smelting Industrial Waste and Simultaneous Removal of Toxic Elements and Phosphates from It,
W74-11354 5D

Copper Content in the Inshore and Estuarine Waters Along the Central West Coast of India,
W74-11358 5B

INDIA (UTTAR PRADESH)
Note on Lithium in Saline Groundwaters,
W74-10908 5B

INDIANA
Make Water Pollution Control a Meaningful Local Responsibility,
W74-11120 5A

INDUSTRIAL PRODUCTION
Major Port Developments at Richards Bay with Due Regard to Preserving the Natural Environment,
W74-11125 2L

INDUSTRIAL WASTES
Determination of Trace Organic Components in Aqueous Wastes,
W74-10974 5B

Industrial Wastewater Monitoring: Basic Considerations,
W74-10978 5D

Chemical Profiles of Kraft Paper Mill Treated Wastewaters,
W74-10992 5D

Operator Certification Programs Applicable to Industrially Owned Waste Water Facilities,
W74-11100 5D

Ozone Treatment of Dye Waste,
W74-11101 5D

Spectrochemical Method For the Determination of 36 Elements in Industrial Effluent,
W74-11351 5A

Characteristics of Zinc Smelting Industrial Waste and Simultaneous Removal of Toxic Elements and Phosphates from It,
W74-11354 5D

Some Effects of Metals Discharged in Effluents and Possibilities for Their Recovery,
W74-11366 5D

Pollution Abatement in a Copper Wire Mill.
W74-11383 5D

INDUSTRIAL WATER
Special Water for Special Paper.
W74-11113 5F

INDUSTRIES
Urbanization and the Environment--Engineering Implications,
W74-11124 4C

INFECTION (POSTHODIPLOSTOMUM)
Effect of Water Salinity on the Incidence of Posthodiplostomum Infection in Fish, (In Russian),
W74-10938 5C

INFILTRATION
Some Features of Water Infiltration into Soil During Sprinkler Irrigation (Nekotoryye osobennosti vpityvaniya vlagi v pochvu pri dozhdevanii),
W74-11013 2G

Smoke Testing Pinpoints Surface Water Inflow,
W74-11082 8A

INFILTRATION RATES
Some Features of Water Infiltration into Soil During Sprinkler Irrigation (Nekotoryye osobennosti vpityvaniya vlagi v pochvu pri dozhdevanii),
W74-11013 2G

INFORMATION EXCHANGE
Data Bank Inventory: Vol. II--Chesapeake Bay, Edition 1, 1949 Through 1970,
W74-11026 2L

Water Data -- A New Awareness,
W74-11205 7C

INLETS (WATERWAYS)
Computation of Flow Through Masonboro Inlet, N.C.,
W74-11036 2L

INSECTICIDES
Oxygen Consumption and Activity of the White Sucker (Catostomus Commersoni), In Lethal and Nonlethal Levels of the Organochlorine Insecticide, Methoxychlor,
W74-11320 5C

INSTITUTIONS
Rational Institutional Arrangements for Water Resources Management,
W74-10901 6E

INSTRUMENTATION
A Preliminary Evaluation of a Discrete Sample Analyzer for Chemical Analysis of Water,
W74-10936 5A

Total Oxygen Demand: A New Tool for Wastewater Analysis,
W74-11083 5D

An Empirical Study of Light Path Behavior, and Application of the Findings to the Design of Precise Surveying Systems for Dam Alignment.
W74-11212 8A

Water and Effluent Instrumentation Made Simple,
W74-11258 5A

INSTRUMENTATION

Lead-Poisoning Detector.
W74-11377 5A

Design and Evaluation of a Vidicon Scanning Spectrometer for Molecular Absorption and Atomic Emission Spectrometry,
W74-11394 5A

INTAKES
Hydraulic Performance of Pennsylvania Highway Drainage Inlets Installed in Paved Channels,
W74-11009 8A

INTENSIVE CARP BREEDING
Determination of the Hematocrit Value of Carp and Its Influencing with Cobalt, (Stanoveni Hematodritove Hodnoty Kapru a Jeji Ovlivneni Kobaltem),
W74-11316 5C

INTERDISCIPLINARY MODELING
Assessment of Selected Rann Environmental Modelling Efforts,
W74-11038 6A

INTERFERENCES
Instrumental Neutron Activation Analysis of Lead Matrices for Mercury,
W74-11373 5A

INTERNATIONAL HYDROLOGICAL DECADE
Hydrologic Engineering Methods for Water Resources Development: Volume I, Requirements and General Procedures,
W74-11231 8B

INTERNATIONAL LAW
The Economic Zone in The Law of The Sea: Survey, Analysis and Appraisal of Current Trends,
W74-11142 6E

Claims to The Ocean,
W74-11147 6E

INTERSTATE COMMISSIONS
Rational Institutional Arrangements for Water Resources Management,
W74-10901 6E

INTERSTITIAL WATER
Mercury Organic Matter Associations in Estuarine Sediments and Interstitial Water,
W74-11122 5B

INTERTIDAL AREAS
Marine Intertidal Community Responses to Kraft Pulp Mill Effluent,
W74-11306 5C

INTESTINAL PROLAPSE
Some Responses of Planktonic Organisms to Environmental Pollution,
W74-11285 5C

INVERTEBRATES
Seasonal Changes in the Drift and Benthic Macroinvertebrates in the Unchannelized Missouri River in South Dakota,
W74-11160 5C

A Comparison of the Macroinvertebrate Aufwachs in the Unstabilized and Stabilized Missouri River,
W74-11161 5C

Numerical Indices Applied to the Results of a Survey of the Macro-Invertebrate Fauna of the Tamar Catchment (Southwest England),
W74-11322 5B

ION EXCHANGE
Cation-Exchange Removal of Copper from Ammoniacal Aqueous Solution,
W74-11027 5D

The Performance of Powdered Ion-Exchange Resins,
W74-11028 5D

Decolorization of Bleach Plant Effluent and Chloride Handling,
W74-11092 5D

Special Water for Special Paper.
W74-11113 5F

Advanced Waste Treatment Process Selection, Part Three,
W74-11135 5C

A Modified Ion Exchange Technique for the Determination of Stability Constants of Metal-Soil Organic Matter Complexes,
W74-11262 5A

Application of Chelating Ion Exchange Resins for Trace Element Analysis of Geological Samples Using X-Ray Fluorescence,
W74-11364 5A

Ion-Exchange Paper Chromatography of Metal Ions with Mixed Aqueous-Organic Solvents Containing Mineral Acid and a Selective Extractant,
W74-11374 5A

IONS
Transmethylation of Heavy Metal Ions in Water,
W74-10983 5B

IRON
APDC-MIBK Extraction System for the Determination of Copper and Iron in 1 Cu Cm of Sea Water by Flameless Atomic-Absorption Spectrometry,
W74-11078 5A

The Accumulation and Retention of 59Fe and 58Co by the Plaice, Pleuronectes Platessa L.,
W74-11300 5C

The Accumulation from Sea Water of 65Zn, 54Mn, 58Co and 59Fe by the Thornback Ray, Raja Clavata L.,
W74-11304 5C

Characteristics of Zinc Smelting Industrial Waste and Simultaneous Removal of Toxic Elements and Phosphates from It,
W74-11354 5D

Oxidation Effect on the Analysis of Iron in the Interstitial Water of Recent Anoxic Sediments,
W74-11379 5B

Filter Pore-Size Effects on the Analysis of Al, Fe, Mn, and Ti in Water,
W74-11421 5A

IRON COMPOUNDS
Purification Plant Eutin, Application of Simultaneous Precipitation for Phosphate Elimination, (Klaeranlage Eutin, Andwendung Der Simultanfaellung Zur Phosphateliminierung,),
W74-11247 5D

IRON *MANGANESE
Interaction of Temperature and Moisture on Iron and Manganese Availability in Soils,
W74-10913 2G

IRON OXIDES
The Use of Magnetic Iron Oxide for Recovery of Virus From Water,
W74-10905 5D

IRON SULPHATE
Purification Plant Eutin, Application of Simultaneous Precipitation for Phosphate Elimination, (Klaeranlage Eutin, Andwendung Der Simultanfaellung Zur Phosphateliminierung,),
W74-11247 5D

IRRIGATION
Tucson Tackles Two Problems.
W74-10945 5D

Effects of Spreading Manure on Groundwater and Surface Runoff,
W74-11240 5B

IRRIGATION WATER
Muskegon County Wastewater Management System No I,
W74-10976 5D

IRTYSH RIVER (USSR)
Catalog of USSR Glaciers. Volume 15. Altay and West Siberia. No. 1. Gornyy Altay and Upper Irtysh. Part 6. Chuya River Basin (Katalog lednikov SSSR. Tom 15. Altay i Zapadnaya Sibir'. Vypusk 1. Gornyy Altay i Verkhniy Irtysh. Chast' 6. Basseyn r. Chui),
W74-11214 2C

ISOCHRYSIS GALBANA
The Growth Kinetics of Isochrysis Galbana in Cultures Containing Sublethal Concentrations of Mercuric Chloride,
W74-11340 5C

ISOLATION
Analysis of Organic Mercury Compounds by Gas Chromatography,
W74-11390 5A

ITALY (CAPE CONERO)
The Determination of Vanadium in Sea Water by Hot Graphite Atomic Absorption Spectrometry on Chitosan After Separation from Salt,
W74-11109 5A

ITAWAMBA CO
Tombigbee River (East Fork), Itawamba County, Mississippi. Operation and Maintenance.
W74-11144 4A

JAPAN
Water Quality Monitoring Systems for Environmental Water and Industrial Effluent in Japan,
W74-10961 5G

JAPAN (HAKATA BAY)
Studies on the Mechanisms of Red Tide Occurrence in Hakata Bay, 3. The Characteristics of Effective Bottom Mud and Its Geographical Distribution Pattern, (In Japanese),
W74-11341 5C

JAPAN (INLAND SEA)
The Flagellata Examined From Polluted Water of the Inland Sea, Setonaikai,
W74-11342 5C

JUDICIAL DECISIONS
Judicial Review of Administrative Decisions Under the National Environmental Policy Act of 1969,
W74-11141 6E

Environmental Defense Fund V. Froehlke (Restraining Order Under Nepa).
W74-11146 6E

Gulf Oil Corp. V. State Mineral Board, Et Al. (Action on Mineral and Water Bottom Rights).
W74-11148 6E

Webster V. Askew (Action to Abate Army Corps Order to Cease Land Development).
W74-11151 6E

ANSAS
Polyelectrolytes as Primary Coagulants for Potable Water Systems,
W74-11117 5F

ENTUCKY
The Hydrology of the Lexington and Fayette County, Kentucky Area,
W74-11201 4A

Kentucky Lake Commercial Catfish Catch Analysis,
W74-11434 8I

ENTUCKY LAKE (KY)
Kentucky Lake Commercial Catfish Catch Analysis,
W74-11434 8I

ETCHIKAN (AK)
Flood Plain Information, Hoadley Creek, Ketchikan, Alaska.
W74-11427 4A

Flood Plain Information, Whipple Creek, Ketchikan, Alaska.
W74-11428 4A

Flood Plain Information, Carlanna Creek, Ketchikan, Alaska.
W74-11429 4A

ETCHIKAN CREEK (AK)
Flood Plain Information, Ketchikan Creek, Ketchikan, Alaska.
W74-11430 4A

EWEENAW PENNINSULA (MI)
Underwater Copper Exploration in Lake Superior Prospects Mapped in 1971,
W74-11392 5B

EWEENAW POINT (MI)
The Distribution of Trace Metals in the Surficial Sediments Surrounding Keweenaw Point, Upper Michigan,
W74-11391 5B

IDNEY
Lead Uptake from Sea Water and Food, and Lead Loss in the Common Mussel Mytilus Edulis,
W74-11311 5C

INETICS
Kinetic Studies of the Stabilities of Chloromethyl Methyl Ether and BIS (Chloromethyl) Ether in Humid Air,
W74-10997 5B

The Growth Kinetics of Isochrysis Galbana in Cultures Containing Sublethal Concentrations of Mercuric Chloride,
W74-11340 5C

IRGIZ SSR
Catalog of USSR Glaciers. Volume 14. Soviet Central Asia. No. 2. Kirgizia. Part 3. Basin in Upper Reaches of the Chu River (Katalog lednikov SSSR. Tom 14. Srednyaya Aziya. Vypusk 2. Kirgiziya. Chast' 3. Basseyn verkhov'yev r. Chu),
W74-11219 2C

Catalog of USSR Glaciers. Volume 14. Soviet Central Asia. No. 2. Kirgizia. Part 2. Basins of Left-Bank Tributaries of the Chu River Downstream from Mouth of the Komorchek River (Katalog lednikov SSSR. Tom 14. Srednyava Aziya. Vypusk 2. Kirgiziya. Chast' 2. Basseyny levykh pritokov r. Chu nizne ustya r. Komorchek),
W74-11221 2C

KOMANDORSKIYE ISLANDS (USSR)
Hydrogeology of the USSR. Volume 29: Kamchatka, and the Kuril and Komandorskiye Islands (Gidrogeologiya SSSR. Tom XXIX. Kamchatka, Kuril'skiye i Komandorskiye ostrova).
W74-11018 2F

KURIL ISLANDS (USSR)
Hydrogeology of the USSR. Volume 29: Kamchatka, and the Kuril and Komandorskiye Islands (Gidrogeologiya SSSR. Tom XXIX. Kamchatka, Kuril'skiye i Komandorskiye ostrova).
W74-11018 2F

LA JOLLA (CAL)
Systems Analysis of a Multi-Stage Tubular Module Reverse Osmosis Plant for Sea Water Desalination,
W74-11039 3A

LABOR
Reducing Labor During Broiler Growout,
W74-11243 5D

LABORATORY TESTING
Make Water Pollution Control a Meaningful Local Responsibility,
W74-11120 5A

LABORATORY TESTS
Validation of Environmental Data by Intercalibration and Laboratory Quality Control Programs,
W74-10950 5A

Need for Collaborative Studies of Standard Methods,
W74-10951 5A

LAKE CARL BLACKWELL (OK)
Biogeochemistry of a Reservoir Ecosystem,
W74-11164 5C

LAKE CAYUGA (NY)
Trace Metals in Lake Cayuga Lake Trout (Salvelinus Namaycush) in Relation to Age,
W74-11336 5C

LAKE MARIUT (EGYPT)
Influence of Organic Pollution on Lake Mariut, A Highly Eutrophicated Lake South of Alexandria,
W74-11283 5C

LAKE OAHE (SD)
Distribution of Total Mercury in the Fishes of Lake Oahe,
W74-11319 5B

LAKE ONTARIO
Pure Waters Project Includes Restoration,
W74-10926 5D

Direct-Filtration Studies for Metropolitan Toronto,
W74-10928 5D

LAKE SEDIMENTS
The Phosphorus Status of Eutrophic Lake Sediments as Related to Changes in Limnological Conditions--Total, Inorganic and Organic Phosphorus,
W74-11131 5C

LAKE ST CLAIR
Mercury Pollution,
W74-11368 5B

LAKE SUPERIOR
The Distribution of Trace Metals in the Surficial Sediments Surrounding Keweenaw Point, Upper Michigan,
W74-11391 5B

Underwater Copper Exploration in Lake Superior Prospects Mapped in 1971,
W74-11392 5B

LAKE TROUT
Short Term Fate of Dietary Dieldrin in the Digestive Tract of Juvenile Lake Trout (Salvelinus Namaycush),
W74-11308 5C

Trace Metals in Lake Cayuga Lake Trout (Salvelinus Namaycush) in Relation to Age,
W74-11336 5C

LAKES
Molecular Size and Spectral Characterization of Organic Matter in a Meromictic Lake,
W74-11067 2H

The Phosphorus Status of Eutrophic Lake Sediments as Related to Changes in Limnological Conditions--Total, Inorganic and Organic Phosphorus,
W74-11131 5C

Study of the Physico-Chemistry of a River System in the French Morvan: II. Seasonal Variations and Influence of Reservoirs on Rivers, (In French),
W74-11159 2K

Dissolved Oxygen and Primary Production in Hypertrophic Shallow Lakes in the District of the River Havel,
W74-11170 2K

Galltrasket: The Geological Development and Palaeolimnology of a Small Polluted Lake in Southern Finland,
W74-11173 2H

Hydrochemical Typing of Small Lakes in Estonia, (In Russian),
W74-11268 2H

LAND DISPOSAL (WASTES)
Muskegon County Wastewater Management System No I,
W74-10976 5D

LAND USE
W.A.L.R.U.S. Water and Land Resource Utilization Simulation Player's Manual (Wisconsin Version),
W74-11041 6A

LANSING (MICH)
Water-Supply Development and Management Alternatives for Clinton, Eaton, and Ingham Counties, Michigan,
W74-11223 4B

LASERS
An Empirical Study of Light Path Behavior, and Application of the Findings to the Design

LASERS

of Precise Surveying Systems for Dam Alignment.
W74-11212 8A

LAW ENFORCEMENT
Legal Controls of Pollution in the Great Lakes Basin,
W74-11417 5G

LAW OF THE SEA
The Economic Zone in The Law of The Sea: Survey, Analysis and Appraisal of Current Trends,
W74-11142 6E

Claims to The Ocean,
W74-11147 6E

LEACHATE
Molecular Size and Spectral Characterization of Organic Matter in a Meromictic Lake,
W74-11067 2H

LEACHING
Residual Effects of N15-Labeled Fertilizers in a Field Study,
W74-11276 3F

LEAD
Typical Level of Lead in Mytilus Galloprovincialis LMK From The Gulf of Trieste,
W74-11290 5B

The Effect of Heavy Metal on Protein Synthesis in Crustaceans and Fish,
W74-11295 5C

Lead Uptake from Sea Water and Food, and Lead Loss in the Common Mussel Mytilus Edulis,
W74-11311 5C

Determination of Lead Using Charged Particle Activation Analysis,
W74-11349 5A

Interrelationship of Biochemical Responses to the Absorption of Inorganic Lead,
W74-11362 5C

Instrumental Neutron Activation Analysis of Lead Matrices for Mercury,
W74-11373 5A

Lead-Poisoning Detector.
W74-11377 5A

Determination of Lead, Uranium, Thorium, and Thallium in Silicate Glass Standard Materials by Isotope Dilution Mass Spectrometry,
W74-11385 5A

LEAD CONTENT DETERMINATION
Typical Level of Lead in Mytilus Galloprovincialis LMK From The Gulf of Trieste,
W74-11290 5B

LEAKAGE
Smoke Testing Pinpoints Surface Water Inflow,
W74-11082 8A

LEECH
Energetics of a Host-Parasite Relationship as Illustrated by the Leech Malmiana nuda, and the Shorthorn Sculpin Myoxocephalus scorpius,
W74-10940 5C

LEGAL ASPECTS
Three Tons is All You Get.
W74-11237 5E

LEGAL REVIEW
Legal Controls of Pollution in the Great Lakes Basin,
W74-11417 5G

LEGISLATION
Focus on Control of Water Pollution in Sao Paulo State and its Relationship to the Pulp and Paper Industries (Enfoque do controle de poluicoa das aguas no estado de Sao Paulo e seu relacionamento com as industrias de celulose e papel),
W74-11090 5D

Judicial Review of Administrative Decisions Under the National Environmental Policy Act of 1969,
W74-11141 6E

Legal Controls of Pollution in the Great Lakes Basin,
W74-11417 5G

LENA RIVER (USSR)
Catalog of USSR Glaciers. Volume 17. Lena-Indigirka Region. No. 2. Middle Lena. Part 1; No. 5. Lower Lena. Part 2. (Katalog lednikov SSSR. Tom 17. Lensko-Indigirskiy rayon. Vypusk 2. Srednyaya Lena. Chast' 1; Vypusk 5. Nizhnyaya Lena. Chast' 2.),
W74-11218 2C

LETHAL LIMIT
Oxygen Consumption and Activity of the White Sucker (Catostomus Commersoni), In Lethal and Nonlethal Levels of the Organochlorine Insecticide, Methoxychlor,
W74-11320 5C

LEXINGTON (KY)
The Hydrology of the Lexington and Fayette County, Kentucky Area,
W74-11201 4A

LIMANDA LIMANDA
The Combined Effect of High Salinity and Temperature on the Survival of Young Limanda Limanda,
W74-11314 5C

LIME
A Study of Conditioning Sewage Sludges with Lime,
W74-11251 5D

LIME CONDITIONING
A Study of Conditioning Sewage Sludges with Lime,
W74-11251 5D

LINEAR ALKYLATE SULFONATE
Toxicity Study of Two Oil Spill Reagents Toward Hudson River Fish Species,
W74-11344 5C

LININGS
Epoxy Tar Lines Birmingham's Trunk,
W74-10920 8A

LIQUID PETROLEUM
Steel Pipeline Design,
W74-11119 8A

LIQUID WASTES
Aeration Device for the Surface Aeration of Liquids,
W74-11062 5D

LITHIUM
Note on Lithium in Saline Groundwaters,
W74-10908 5B

LITTER
Larch Litter Removal has No Significant Effect on Runoff,
W74-11071 2E

Reducing Labor During Broiler Growout,
W74-11243 5D

LOBSTERS
Effects of Crude Oil on the Feeding Behavior of the Lobster Homarus Americanus,
W74-11333 5C

LOCAL GOVERNMENTS
Rational Institutional Arrangements for Water Resources Management,
W74-10901 6E

LOCKS
Lock and Dam No. 8, Arkansas River Navigation Project, Hydraulic Model Investigation,
W74-11211 8B

LONG ISLAND SOUND
Effect of Thermal Effluent on Migrating Menhaden,
W74-11305 5C

LOS ANGELES (CALIF)
The Flow of Trace Elements Through the Los Angeles Area: Effect on Non-Urban Areas,
W74-10988 5B

LOS ANGELES COAST (CA)
Free Amino Acid Variations in the Anchovy, Engraulis Mordax (Girard) from the Los Angeles Coastal Area,
W74-11294 5C

LOS ANGELES COUNTY (CALIF)
The Flow of Trace Elements Through the Los Angeles Basin: Zn, Cd, and Ni,
W74-10987 5B

LOUISIANA
Gulf Oil Corp. V. State Mineral Board, Et Al. (Action on Mineral and Water Bottom Rights).
W74-11148 6E

LOWER PAWCATUCK RIVER BASIN (RI)
Availability of Groundwater in the Lower Pawcatuck River Basin, Rhode Island,
W74-11023 4B

LYSIMETERS
A Weighing System for Lysimeters,
W74-11277 2D

MAGMAS
Meteoric Water in Magmas,
W74-11112 2K

MAGMATIC WATER
Meteoric Water in Magmas,
W74-11112 2K

MAGNESIUM
Calcium, Magnesium, and Potassium Saturation Ratios in Two Soils and Their Effects Upon Yields and Nutrient Contents of German Millet and Alfalfa,
W74-11269 3F

Predicting Chelate Performance in Boilers,
W74-11380 5B

MAGNETIC IRON OXIDE
The Use of Magnetic Iron Oxide for Recovery of Virus From Water,
W74-10905 5D

AIA SQUINADO
Qualitative Studies on the Metabolism of Napthalene in Maia Squinado (Herbst),
W74-11339 5C

AINE (SHEEPSCOT ESTUARY)
Reproduction of the Bloodworm (Glycera dibranchiata) in the Sheepscot Estuary, Maine,
W74-11043 2L

ALACHITE
The Concentration Control of Soluble Copper in a Mine Tailings Stream,
W74-11361 5B

ALKA RIVER (USSR)
Quality of Water and Suspended Sediments in the Baksan and Malka Rivers (O kachestve vody i vzveshennykh nanosov rek Baksana i Malki),
W74-11012 5B

ANAGEMENT
Rational Institutional Arrangements for Water Resources Management,
W74-10901 6E

Some Current Paper Industry Environmental Protection Problems,
W74-11126 5D

ANGANESE
The Accumulation and Retention of 65Zn and 54Mn by the Plaice, Pleuronectes Platessa L.,
W74-11299 5C

The Accumulation from Sea Water of 65Zn, 54Mn, 58Co and 59Fe by the Thornback Ray, Raja Clavata L.,
W74-11304 5C

Adaptation of the Polychaete Nereis Diversicolor to Manganese in Estuarine Sediments,
W74-11338 5C

Filter Pore-Size Effects on the Analysis of Al, Fe, Mn, and Ti in Water,
W74-11421 5A

ANURE
Three Tons is All You Get.
W74-11237 5E

Effects of Spreading Manure on Groundwater and Surface Runoff,
W74-11240 5B

APPING
The Urban Plume of St. Louis,
W74-10964 5B

APS
North Cascades Highway SR-20 Avalanche Atlas,
W74-11226 2C

ARINAS
Marina Protective Wave Breaker,
W74-11412 8B

ARINE BIOLOGY
Oil Pollution and Marine Ecology,
W74-11166 5C

Effect of Oil on Marine Ecosystems: A Review For Administrators and Policy Makers,
W74-11348 5G

ARINE FISH
A Seasonal Survey of the Fishes in the Mystic River, a Polluted Estuary in Downtown Boston, Massachusetts,
W74-11302 5B

MASONBORO INLET (NC)
Computation of Flow Through Masonboro Inlet, N.C.,
W74-11036 2L

MASS SPECTROMETRY
Monitoring the Aquatic Environment for Specific Organic Pollutants,
W74-10959 5A

Determination of Lead, Uranium, Thorium, and Thallium in Silicate Glass Standard Materials by Isotope Dilution Mass Spectrometry,
W74-11385 5A

MASSACHUSETTS
Andover Gives Shot to Supply,
W74-10944 5F

Prototype Study of Microstraining at a Paper Mill Complex,
W74-11104 5D

A Seasonal Survey of the Fishes in the Mystic River, a Polluted Estuary in Downtown Boston, Massachusetts,
W74-11302 5B

MATHEMATICAL MODELS
Use of Pipelines as Aerobic Biological Reactors,
W74-10925 5D

A Finite Element Approach to Watershed Runoff,
W74-10937 2A

Assessment of Selected Rann Environmental Modelling Efforts,
W74-11038 6A

Dynamic Models and Control Strategies for Waste Water Treatment Processes,
W74-11069 5D

Historical Development of Water Pollution Control Cost Functions,
W74-11102 5G

Users Guide for a U.S. Geological Survey Rainfall-Runoff Model,
W74-11234 2A

Autocorrelation Structure of Monthly Streamflows,
W74-11419 2E

Digital Modeling of Radioactive and Chemical Waste Transport in the Snake River Plain Aquifer at the National Reactor Testing Station, Idaho,
W74-11439 5B

MEAN CELL RESIDENCE TIME
Facilities for Controlling the Activated Sludge Process by Mean Cell Residence Time,
W74-11254 5D

MEASUREMENT
An Empirical Study of Light Path Behavior, and Application of the Findings to the Design of Precise Surveying Systems for Dam Alignment.
W74-11212 8A

Quality of Berlin Surface Waters: Measuring Scheme, (Das Gutemess Programm Der Berliner Oberflachengewasser),
W74-11252 5A

Colorimetric, Semiquantitative Test for Soil Salinity,
W74-11265 2G

Design and Evaluation of a Vidicon Scanning Spectrometer for Molecular Absorption and Atomic Emission Spectrometry,
W74-11394 5A

MEASUREMENTS
History of Metal Pollution in Southern California Coastal Zone,
W74-11130 5A

MEIOFAUNA
Resistance and Respiratory Physiology of Intertidal Meiofauna to Oxygen-Deficiency,
W74-11309 5C

MEMBRANE PROCESSES
An Amperometric Membrane Halogen Analyzer,
W74-10980 5A

Trace Organic Contaminants in Drinking Water; Evaluation of Semi-Permeable Membranes and Osmotic Pumping to Achieve Concentration,
W74-10981 5F

Trace Organic Contaminants in Drinking Water; Their Concentration by Reverse Osmosis,
W74-10982 5F

Reverse Osmosis Separation of Some Heavy Metallic Salts in Aqueous Solution (in Japanese),
W74-11105 5D

Treatment of Alkali Extraction Effluents by Ultrafiltration (Traitement des effluents de sodation par ultrafiltration),
W74-11114 5D

MEMBRANES
Membranes for Reverse Osmosis,
W74-10932 5D

MENHADEN
Effect of Thermal Effluent on Migrating Menhaden,
W74-11305 5C

MERCENARIA MERCINARIA
Trace Metals in Sediments and Bivalve Mollusca in Southampton Water and the Solent,
W74-11288 5B

MERCURIC CHLORIDE
Effects of Dietary Mercury on Mink,
W74-10930 5C

The Growth Kinetics of Isochrysis Galbana in Cultures Containing Sublethal Concentrations of Mercuric Chloride,
W74-11340 5C

MERCURY
Methylation of Mercury in Lake and River Sediments During Field and Laboratory Investigations,
W74-10924 5B

Effects of Dietary Mercury on Mink,
W74-10930 5C

Transmethylation of Heavy Metal Ions in Water,
W74-10983 5B

A Piezoelectric Sensor for Mercury in Air,
W74-11003 5A

Mercury Organic Matter Associations in Estuarine Sediments and Interstitial Water,
W74-11122 5B

MERCURY

Mercury Contamination of Vegetation Due to the Application of Sewage Sludge as a Fertilizer,
W74-11133 5A

Long-Term Annual Fluctuations of Mercury in the Zooplankton of the East Central Adriatic,
W74-11291 5B

Distribution of Total Mercury in the Fishes of Lake Oahe,
W74-11319 5B

Methylmercury Exposure, Mercury Levels in Blood and Hair, and Health Status in Swedes Consuming Contaminated Fish,
W74-11330 5B

The Growth Kinetics of Isochrysis Galbana in Cultures Containing Sublethal Concentrations of Mercuric Chloride,
W74-11340 5C

Determination of Total Mercury in Air by Charcoal Adsorption and Ultraviolet Spectrophotometry,
W74-11363 5A

The Avifauna of Sweden as Indicators of Environmental Contamination with Mercury and Chlorinated Hydrocarbons,
W74-11367 5B

Mercury Pollution,
W74-11368 5B

Scientists Find How Mercury Damages Cells,
W74-11369 5C

Effects of Regulatory Guidelines of the Intake of Mercury from Fish - the MECCA Project,
W74-11372 5C

Instrumental Neutron Activation Analysis of Lead Matrices for Mercury,
W74-11373 5A

The Interaction of Mercury with Cadmium and Zinc in Mammalian Embryonic Development,
W74-11375 5C

Mercury Determinations in Natural Waters by Persulfate Oxidation,
W74-11378 5A

Characteristics and Relationships of Mercury-Resistant Mutants and Methionine Auxotrophs of Yeast,
W74-11381 5C

Mercury Content in Feathers of Swedish Birds from the Past 100 Years,
W74-11382 5A

Determination of Submicrogram Amounts of Mercury by the Oxygen Bomb Combustion Method,
W74-11388 5A

Analysis of Organic Mercury Compounds by Gas Chromatography,
W74-11390 5A

Formation of Methylmercury in a Terrestrial Environment,
W74-11393 5B

The Determination of Mercury in Commercially Important Aquatic Organisms,
W74-11438 5A

MEROMIXIS

Molecular Size and Spectral Characterization of Organic Matter in a Meromictic Lake,
W74-11067 2H

MESABI IRON RANGE (MINN)

Hydrogeology of Glacial Drift, Mesabi Iron Range, Northeastern Minnesota,
W74-11222 2F

METABOLISM

The Sublethal Effects of Environmental Variables on Polychaetous Annelids,
W74-11292 5C

Free Amino Acid Variations in the Anchovy, Engraulis Mordax (Girard) from the Los Angeles Coastal Area,
W74-11294 5C

Resistance and Respiratory Physiology of Intertidal Meiofauna to Oxygen-Deficiency,
W74-11309 5C

Qualitative Studies on the Metabolism of Napthalene in Maia Squinado (Herbst),
W74-11339 5C

Early Actions of Cadmium in the Rat and Domestic Fowl-6 Testicular and Muscle Blood Flow Changes,
W74-11370 5C

Characteristics and Relationships of Mercury-Resistant Mutants and Methionine Auxotrophs of Yeast,
W74-11381 5C

METAL IONS

Ion-Exchange Paper Chromatography of Metal Ions with Mixed Aqueous-Organic Solvents Containing Mineral Acid and a Selective Extractant,
W74-11374 5A

METALS

Effect of Nitrogen and Phosphorus at Two Moisture Levels on the Status of the Available Zn, Cu, Mn and Fe in the Soil,
W74-10918 5B

History of Metal Pollution in Southern California Coastal Zone,
W74-11130 5A

The Solvent Extraction Atomic Absorption Analysis of Effluents and Water,
W74-11260 5A

Effects on Hepatocytes in Cell Cultures at Various Combinations of Heavy Metals Present in Titanium Waste Waters, (Action Sur Des Hepatocytes en Culture Histiotypique, de Divers Composes Metalliques Presents Dans Les Eaux Residuaires de l'Industries du Titane),
W74-11296 5C

Ion-Exchange Paper Chromatography of Metal Ions with Mixed Aqueous-Organic Solvents Containing Mineral Acid and a Selective Extractant,
W74-11374 5A

Design and Evaluation of a Vidicon Scanning Spectrometer for Molecular Absorption and Atomic Emission Spectrometry,
W74-11394 5A

METEORIC WATER

Meteoric Water in Magmas,
W74-11112 2K

METEOROLOGY

Causes for Precipitation Increases in the Hills of Southern Illinois,
W74-11138 2B

METHANE

Methylation of Mercury in Lake and River Sediments During Field and Laboratory Investigations,
W74-10924 5B

Digestion Byproduct May Give Answer to Energy Problem,
W74-10935 5D

METHIONINE ANTOTROPHS

Characteristics and Relationships of Mercury-Resistant Mutants and Methionine Auxotrophs of Yeast,
W74-11381 5C

METHODOLOGY

Continuous-Flow Bioassays with Aquatic Organisms: Procedures and Applications,
W74-11326 5A

METHOXYCHLOR

Oxygen Consumption and Activity of the White Sucker (Catostomus Commersoni), In Lethal and Nonlethal Levels of the Organochlorine Insecticide, Methoxychlor,
W74-11320 5C

METHYL-MERCURY

Methylation of Mercury in Lake and River Sediments During Field and Laboratory Investigations,
W74-10924 5B

Distribution of Total Mercury in the Fishes of Lake Oahe,
W74-11319 5B

METHYLMERCURY

Effects of Dietary Mercury on Mink,
W74-10930 5C

Methylmercury Exposure, Mercury Levels in Blood and Hair, and Health Status in Swedes Consuming Contaminated Fish,
W74-11330 5B

Determination of Submicrogram Amounts of Mercury by the Oxygen Bomb Combustion Method,
W74-11388 5A

Analysis of Organic Mercury Compounds by Gas Chromatography,
W74-11390 5A

Formation of Methylmercury in a Terrestrial Environment,
W74-11393 5B

MEXICO

Water-Borne Transmission of Chloramphenicol-Resistant Salmonella typhi in Mexico,
W74-10906 5C

MICHIGAN

Sewer-Within-Sewer Saves City $400,000,
W74-10921 5D

Muskegon County Wastewater Management System No I,
W74-10976 5D

Water-Supply Development and Management Alternatives for Clinton, Eaton, and Ingham Counties, Michigan,
W74-11223 4B

The Distribution of Trace Metals in the Surficial Sediments Surrounding Keweenaw Point, Upper Michigan,
W74-11391 5B

Underwater Copper Exploration in Lake Superior Prospects Mapped in 1971,
W74-11392 5B

CROORGANISMS
The Use of Magnetic Iron Oxide for Recovery of Virus From Water,
W74-10905 5D

Sublethal Effects of Several Metallic Salts-Organic Compounds Combinations Upon the Heterotrophic Microflora of a Natural Water,
W74-11352 5C

Toxicity of Chromium Compounds Under Aerobic Conditions,
W74-11360 5C

CROSTRAINER
Efficiency Tests for Microstrainer Waste Treatment, (Maikuro sutorena ni yoru shorisui kojo shiken),
W74-10915 5D

LITARY ASPECTS
Seventh Annual Survey Report on the Air Weather Service Weather Modification Program (FY 1974),
W74-11433 3B

NE DRAINAGE
The Concentration Control of Soluble Copper in a Mine Tailings Stream,
W74-11361 5B

NERALOGY
Nitrogen Mineralization Potentials of Soils,
W74-11272 2G

NK
Effects of Dietary Mercury on Mink,
W74-10930 5C

NNESOTA
Hydrogeology of Glacial Drift, Mesabi Iron Range, Northeastern Minnesota,
W74-11222 2F

REX
Biodegradation of Mirex By Sewage Sludge Organisms,
W74-11345 5B

SSISSIPPI
Tombigbee River (East Fork), Itawamba County, Mississippi. Operation and Maintenance.
W74-11144 4A

SSOURI
The Urban Plume of St. Louis,
W74-10964 5B

H2SO4/(NH4)2SO4 Aerosol: Optical Detection in St. Louis Region,
W74-10965 5A

Environmental Defense Fund V. Froehlke (Restraining Order Under Nepa).
W74-11146 6E

TES
Fall Increase of the Population of Aquatic Mites in the Mouths of Rivers and Streams, (in Russian),
W74-11181 2E

MOBILE BAY ESTUARY
Mercury Organic Matter Associations in Estuarine Sediments and Interstitial Water,
W74-11122 5B

MODEL STUDIES
Scale-Up Solid Bowl Centrifuge Performance,
W74-10914 5D

Storm Drainage Systems Design Made Adaptable for Computers,
W74-10916 4A

Assessment of Selected Rann Environmental Modelling Efforts,
W74-11038 6A

The Integration of System Identification and System Optimization,
W74-11042 6A

Adaptive Control Applied to a Water Quality System,
W74-11129 5G

MOISTURE CONTENT
Relationship Between Coefficients of Heat Conductivity and Thermal Moisture Conductivity of Soils (O svyazi mezhdu koeffitsiyentami temperaturoprovodnosti i termovlagoprovodnosti v pochvakh),
W74-11015 2G

MOISTURE UPTAKE
Ionic Relationships of Soil and Plant: 4. Ion Uptake in Relation to Membrane Activity and Moisture,
W74-11280 2I

MOLECULAR STRUCTURE
An Empirical Intermolecular Potential Energy Function for Water,
W74-11106 2K

MOLECULAR WEIGHT
Molecular Size and Spectral Characterization of Organic Matter in a Meromictic Lake,
W74-11067 2H

MOLLUSCS
Use of Neritic Trophodynamic Chain of Molluscs for the Study of the Transfer of Metallic Pollutants, (Utilisation D'une Chaine Trophodynamique De Type Neritique A Mollusques Pour L'etude Des Transferts Des Polluants Metalliques),
W74-11287 5C

MOLLUSKS
Effect of Water Salinity on the Incidence of Posthodiplostomum Infection in Fish, (In Russian),
W74-10938 5C

Trace Metals in Sediments and Bivalve Mollusca in Southampton Water and the Solent,
W74-11288 5B

MOLYBDENUM
The Determination of Trace Quantities of Molybdenum by Atomic Absorption Spectroscopy,
W74-11371 5A

MONITORING
Symposium on Environmental Quality Monitoring; Symposium on Sources and Evolution of the Atmospheric Aerosol; General Papers.
W74-10947 5A

Evolution of Monitoring for Earthwatch,
W74-10948 5A

Optimization of Water Quality Monitoring Programmes,
W74-10949 5A

Validation of Environmental Data by Intercalibration and Laboratory Quality Control Programs,
W74-10950 5A

Need for Collaborative Studies of Standard Methods,
W74-10951 5A

The Assessment of Environmental Impact--Water Quality and Quality Assurance Considerations,
W74-10952 5A

Sensors for Water and Wastewater Process Control,
W74-10958 5D

Monitoring the Aquatic Environment for Specific Organic Pollutants,
W74-10959 5A

Application of Monitoring Technology (For Assuring) Drinking Water Quality,
W74-10960 5F

Water Quality Monitoring Systems for Environmental Water and Industrial Effluent in Japan,
W74-10961 5G

Waste Water Monitoring Program by the City of New York,
W74-10962 5D

Viral Quality Monitoring in the Polluted Aquatic Environment,
W74-10963 5B

NPDES Self-Monitoring and Reporting Requirements,
W74-10970 5G

Automated Wet Chemical Analysis Instruments for Continuous Effluent Monitoring,
W74-10971 5D

Use of Chemical-Sensing Electrodes in Monitoring,
W74-10972 5A

Application of Analytical Instrumentation to Industrial Monitoring of Aqueous Effluents,
W74-10973 5B

Determination of Trace Organic Components in Aqueous Wastes,
W74-10974 5B

Water Sampling,
W74-10975 5B

Environmental Analysis of Ocean Dumping,
W74-10977 5B

Industrial Wastewater Monitoring: Basic Considerations,
W74-10978 5D

Waste and Water Monitoring,
W74-10979 5D

An Amperometric Membrane Halogen Analyzer,
W74-10980 5A

Detection of Hydrocarbons by Chemiluminescence with Active Nitrogen at 388 nm,
W74-11000 5A

MONITORING

A Piezoelectric Sensor for Mercury in Air,
W74-11003 5A

The Fluorescence Detection of Nitric Oxide,
W74-11004 5A

An Automated Instrument for the Continuous Measurement of Reactive Hydrocarbons,
W74-11007 5A

A National Overview of Existing Coastal Water Quality Monitoring.
W74-11010 5A

Total Oxygen Demand: A New Tool for Wastewater Analysis,
W74-11083 5D

Possibilities of Using Chemical-Physical Purification Process for Waste Waters (Einsatzmoeglichkeiten chemischphysikalischer Reinigungsverfahren bei Restabwaessern),
W74-11099 5D

Make Water Pollution Control a Meaningful Local Responsibility,
W74-11120 5A

How to Measure Ambient Pollution,
W74-11255 5A

Coughing Fish May Monitor Water Quality.
W74-11257 5A

MONROE COUNTY (NY)
Pure Waters Project Includes Restoration,
W74-10926 5D

MONTANA
Application Hydrologic and Hydraulic Research to Culvert Selection in Montana--Vol II, Appendices,
W74-11022 8B

Atmospheric Water Resources Management Program,
W74-11229 3B

MOORHEAD BAYOU
Moorhead Bayou Watershed, Sunflower County, Mississippi (Final Environmental Impact Statement).
W74-11143 6E

MORPHOLOGICAL CHANGES
Some Responses of Planktonic Organisms to Environmental Pollution,
W74-11285 5C

MOSCOW OBLAST
Some Features of Water Infiltration into Soil During Sprinkler Irrigation (Nekotoryye osobennosti vpityvaniya vlagi v pochvu pri dozhdevanii),
W74-11013 2G

MOUNTAINS
Glaciohydroclimatology of Mountainous Countries (Glyatsiogidroklimatologiya gornykh stran).
W74-11446 2C

MUDDY RIVER (UTAH)
River Mile Index--Virgin River Basin, Arizona, Nevada, Utah.
W74-11030 2E

MULCHING
Mulch and Tillage Relationships in Corn Culture,
W74-11275 3F

MULLETS
A Kerosene-Like Taint in the Sea Mullet, Mugil Cephalus (Linnaeus) I. Composition and Environmental Occurrence of the Tainting Substance,
W74-11312 5C

MUNCIE (IN)
Make Water Pollution Control a Meaningful Local Responsibility,
W74-11120 5A

MUNICIPAL WASTES
Direct-Filtration Studies for Metropolitan Toronto,
W74-10928 5D

The Influence of Certain Toxic Substances, Contained in Domestic Wastes, on the Bacteria Escherichia Coli and Pseudomonas Flourescens, (L'Influence De Certaines Substances Toxiques, Contenues Dans Les Eaux D'egouts Municipaux, Sur Les Bacteries Escherichia Coli Et Pseudomonas Flourescens),
W74-11301 5C

MUNICIPAL WATER
Andover Gives Shot to Supply,
W74-10944 5F

MUSKEGON (MICH)
Muskegon County Wastewater Management System No I,
W74-10976 5D

MUSSELS
Typical Level of Lead in Mytilus Galloprovincialis LMK From The Gulf of Trieste,
W74-11290 5B

Lead Uptake from Sea Water and Food, and Lead Loss in the Common Mussel Mytilus Edulis,
W74-11311 5C

MYSTIC RIVER (MA)
A Seasonal Survey of the Fishes in the Mystic River, a Polluted Estuary in Downtown Boston, Massachusetts,
W74-11302 5B

MYTILUS EDULIS
Lead Uptake from Sea Water and Food, and Lead Loss in the Common Mussel Mytilus Edulis,
W74-11311 5C

MYTILUS GALLOPROVINCIALIS
Typical Level of Lead in Mytilus Galloprovincialis LMK From The Gulf of Trieste,
W74-11290 5B

NAPHTHALENE
Qualitative Studies on the Metabolism of Napthalene in Maia Squinado (Herbst),
W74-11339 5C

NARYN RIVER (USSR)
Catalog of USSR Glaciers. Volume 14. Soviet Central Asia. No 1. Syrdar'ya. Part 4. (Katalog lednikov SSSR. Tom 14. Srednyaya Aziya. Vypusk 1. Syrdar'ya. Chast' 4.),
W74-11217 2C

NATIONAL ENVIRONMENTAL POLICY ACT
The Assessment of Environmental Impact--Water Quality and Quality Assurance Considerations,
W74-10952 5A

Moorhead Bayou Watershed, Sunflower County, Mississippi (Final Environmental Impact Statement).
W74-11143 6E

NATIONAL ENVIRONMENTAL POLICY ACT (NEPA)
Judicial Review of Administrative Decisions Under the National Environmental Policy Act of 1969,
W74-11141 6E

Environmental Defense Fund V. Froehlke (Restraining Order Under Nepa).
W74-11146 6E

NAVIGABLE WATERS
Gulf Oil Corp. V. State Mineral Board, Et Al. (Action on Mineral and Water Bottom Rights).
W74-11148 6E

NAVIGATION
Method of Clearing a Path Through Ice,
W74-11051 8C

NEMAN RIVER (USSR)
Prospects of Groundwater Use in the Neman and Neris River Valleys (Perspektivy ispol'zovaniya podzemnykh vod rechnykh dolin Nyamunas i Neris),
W74-11447 4B

NEOMYSIS AMERICANA
Acute Toxicity of Unbleached Kraft Mill Effluent (UKME) to the Opossum Shrimp, Neomysis Americana Smith,
W74-11324 5C

NEREIS DIVERSICOLOR
Adaptation of the Polychaete Nereis Diversicolor to Estuarine Sediments Containing High Concentrations of Zinc and Cadmium,
W74-11337 5C

Adaptation of the Polychaete Nereis Diversicolor to Manganese in Estuarine Sediments,
W74-11338 5C

NERIS RIVER (USSR)
Prospects of Groundwater Use in the Neman and Neris River Valleys (Perspektivy ispol'zovaniya podzemnykh vod rechnykh dolin Nyamunas i Neris),
W74-11447 4B

NETHERLANDS (RIVER MASS)
Roughness Coefficients of Vegetated Flood Plains,
W74-11136 2E

NETWORKS
Evolution of Monitoring for Earthwatch,
W74-10948 5A

NEUTRON ACTIVATION ANALYSIS
Instrumental Neutron Activation Analysis of Lead Matrices for Mercury,
W74-11373 5A

Mercury Content in Feathers of Swedish Birds from the Past 100 Years,
W74-11382 5A

NEVADA
River Mile Index--Virgin River Basin, Arizona, Nevada, Utah.
W74-11030 2E

River Mile Index, Sevier Lake Basin, Utah and Minor Basins in Western Utah and Eastern Nevada.
W74-11432 7C

NEW HAVEN HARBOR (CT)
Maintenance Dredging, New Haven Harbor, Connecticut (Final Environmental Impact Statement).
W74-11140 4C

NEW JERSEY
Mass and Composition of an Urban Aerosol as a Function of Size for Several Visibility Levels,
W74-10969 5B

NEW YORK
Pure Waters Project Includes Restoration,
W74-10926 5D

The Pressure Sewer: A New Alternative to the Gravity Sewer,
W74-10946 5D

Effect of Thermal Effluent on Migrating Menhaden,
W74-11305 5C

Trace Metals in Lake Cayuga Lake Trout (Salvelinus Namaycush) in Relation to Age,
W74-11336 5C

Toxicity Study of Two Oil Spill Reagents Toward Hudson River Fish Species,
W74-11344 5C

NEW YORK CITY
Problems on Pollution and Water Resources in the New York City Metropolitan Area,
W74-10942 5D

Waste Water Monitoring Program by the City of New York,
W74-10962 5D

NIAGARA FALLS (ONTARIO)
Niagara Falls Water Plant Converts Gravity Filters Hydraulically.
W74-10943 5D

NICKEL
The Flow of Trace Elements Through the Los Angeles Basin: Zn, Cd, and Ni,
W74-10987 5B

The Flow of Trace Elements Through the Los Angeles Area: Effect on Non-Urban Areas,
W74-10988 5B

NITRATES
Sulfate and Nitrate Chemistry in Photochemical Smog,
W74-10956 5A

Biogeochemistry of a Reservoir Ecosystem,
W74-11164 5C

NITRIFICATION
Ammonia Elimination System,
W74-11399 5D

NITRILOTRIACETIC ACID
Predicting Chelate Performance in Boilers,
W74-11380 5B

NITROGEN
Agricultural Waste Water Accommodation and Utilization by Various Forages,
W74-10903 5D

Effect of Nitrogen and Phosphorus at Two Moisture Levels on the Status of the Available Zn, Cu, Mn and Fe in the Soil,
W74-10918 5B

The Effects of Nitrogen, Potassium, and Subirrigation on the Yield, Quality, and Composition of Single-Truss Tomatoes,
W74-11048 3F

The Phosphorus Status of Eutrophic Lake Sediments as Related to Changes in Limnological Conditions--Total, Inorganic and Organic Phosphorus,
W74-11131 5C

Biogeochemistry of a Reservoir Ecosystem,
W74-11164 5C

Rates of Growth and Nutrient Uptake of Irrigated Corn as Affected by N and P Fertilization,
W74-11263 3F

Applied and Residual Nitrate-Nitrogen Effects on Irrigated Grain Sorghum Yield,
W74-11270 3F

Nitrogen Mineralization Potentials of Soils,
W74-11272 2G

Residual Effects of N15-Labeled Fertilizers in a Field Study,
W74-11276 3F

Priming Effect of N-15 Labeled Fertilizers on Soil Nitrogen in Field Experiments,
W74-11279 5B

NITROGEN COMPOUNDS
Operation Characteristics of NO2 Permeation Devices,
W74-11002 5A

NITROGEN DIOXIDE
Operation Characteristics of NO2 Permeation Devices,
W74-11002 5A

NON-UNIFORM FLOW
Varied Flow Functions for Elliptic Channels,
W74-11139 8B

NONDIMENSIONAL ANALYSIS
Varied Flow Functions for Elliptic Channels,
W74-11139 8B

NORTH CAROLINA
Computation of Flow Through Masonboro Inlet, N.C.,
W74-11036 2L

NORTH CASCADES HIGHWAY (WA)
Avalanches on the North Cascades Highway (SR-20)--Summary Report,
W74-11444 2C

NORTH CASCADES HIGHWAY (WASH)
North Cascades Highway SR-20 Avalanche Atlas,
W74-11226 2C

NORTH DAKOTA
Groundwater Basic Data for Adams and Bowman Counties, North Dakota,
W74-11024 2F

NORTHEAST U.S.
Cost Analysis of Groundwater Supplies in the North Atlantic Region,
W74-11426 4B

NORWAY
Evaluation of Glacier Mass Balance by Observing Variations in Transient Snowline Positions,
W74-11437 2C

NUCLEAR POWER PLANTS
Copepod and Chlorophyll a Concentrations in Receiving Waters of a Nuclear Power Station and Problems Associated With Their Measurement,
W74-11343 5B

NUCLEAR POWERPLANTS
Cation-Exchange Removal of Copper from Ammoniacal Aqueous Solution,
W74-11027 5D

NUMERICAL ANALYSIS
Scale-Up Solid-Bowl Centrifuge Performance,
W74-10914 5D

NUMERICAL INDICES
Numerical Indices Applied to the Results of a Survey of the Macro-Invertebrate Fauna of the Tamar Catchment (Southwest England),
W74-11322 5B

NUTRIENT REMOVAL
Agricultural Waste Water Accommodation and Utilization by Various Forages,
W74-10903 5D

Applied and Residual Nitrate-Nitrogen Effects on Irrigated Grain Sorghum Yield,
W74-11270 3F

Nitrogen Mineralization Potentials of Soils,
W74-11272 2G

Residual Effects of N15-Labeled Fertilizers in a Field Study,
W74-11276 3F

Priming Effect of N-15 Labeled Fertilizers on Soil Nitrogen in Field Experiments,
W74-11279 5B

NUTRIENT REQUIREMENTS
Rates of Growth and Nutrient Uptake of Irrigated Corn as Affected by N and P Fertilization,
W74-11263 3F

NUTRIENTS
Trace Elements: A Growing Appreciation of Their Effects on Man,
W74-11395 5C

OCEAN INCINERATION
Ocean Incineration of Toxic Wastes.
W74-11132 5E

OCEANS
Ocean Incineration of Toxic Wastes.
W74-11132 5E

Claims to The Ocean,
W74-11147 6E

ODOR
Chemical Analysis of the Smoky-Burnt Odor Complex in Diesel Exhaust,
W74-11005 5A

Effect of Waste Management and Egg Processing on the Flavor of Cooked Eggs,
W74-11236 5C

OFFSHORE DUMPING
Maintenance Dredging, New Haven Harbor, Connecticut (Final Environmental Impact Statement).
W74-11140 4C

OFFSHORE PLATFORMS
Policy For Location of Power Plants in Coastal Areas,
W74-11145 6G

A Bill to Provide for a Federal Ecological Preserve.
W74-11150 6E

Oxygen Consumption and Activity of the White Sucker (Catostomus Commersoni), In Lethal and Nonlethal Levels of the Organochlorine Insecticide, Methoxychlor,
W74-11320 5C

OXYGEN ISOTOPES
Meteoric Water in Magmas,
W74-11112 2K

OXYGENATION
Use of Ozone and Oxygen in Advanced Waste Water Treatment,
W74-11103 5D

OYSTERS
Restoration of an Oyster Resource Destroyed by Natural Causes,
W74-11163 8I

OZONE
Technical and Economic Aspects of Water and Waste Water Ozonation: A Critical Review,
W74-11070 5D

Preliminary Laboratory Studies of the Decolorization and Bactericidal Properties of Ozone in Pulp and Paper Mill Effluents,
W74-11089 5D

Ozone Decolorization of Effluents from Secondary Treatment,
W74-11095 5D

Ozone Treatment of Dye Waste,
W74-11101 5D

Use of Ozone and Oxygen in Advanced Waste Water Treatment,
W74-11103 5D

Device and Apparatus for Treating Liquids Such as Drinking Water and Waste Water,
W74-11403 5D

Apparatus for Treating and Purifying Sewage, Particularly Sewage Contaminated with Detergents,
W74-11411 5D

PALLADIUM
Transmethylation of Heavy Metal Ions in Water,
W74-10983 5B

PARTICLE SIZE
Evaporation of Water from Sand, 4: The Influence of the Depth of the Water-Table and the Particle Size Distribution of the Sand,
W74-11267 2D

PATENTS
Method of Treating Subterranean Formation to Improve Permeability,
W74-10931 8B

Membranes for Reverse Osmosis,
W74-10932 5D

Method and Apparatus for the Treatment of Influent Waters Such as Sewage,
W74-10933 5D

Filter Systems,
W74-11044 5C

Floating Boom Deployment Apparatus,
W74-11046 5G

Water Aeration Equipment,
W74-11047 5D

Water Power Apparatus,
W74-11049 8C

Multistage Evaporator,
W74-11050 3A

Method of Clearing a Path Through Ice,
W74-11051 8C

PATENTS

Purifying Plant for Sewage,
W74-11052 5D

Sewage Treatment Apparatus,
W74-11053 5D

Floatable Boom Structure,
W74-11054 5G

Oil Slick Removal Method, System and Bag Therefor,
W74-11055 5G

Underwater Leakage Oil Collector System,
W74-11056 5G

Apparatus for Removing a Substance Floating as a Layer on the Surface of a Body of Liquid,
W74-11057 5G

Offset Breakwater Configuration,
W74-11058 8B

Process for Treating Oil Slicks Using Chemical Agents,
W74-11059 5G

Floating Antipollution Barrier Device.
W74-11060 5G

Apparatus for Collecting Surface Particles on Body of Water,
W74-11061 5G

Aeration Device for the Surface Aeration of Liquids,
W74-11062 5D

Selective Adsorption of Phenols from Solution in Water,
W74-11063 5D

Process for Treating Domestic and Industrial Liquid Wastes,
W74-11064 5D

Evaporating Method and Evaporating Apparatus,
W74-11396 3A

Method and Apparatus for Separation of Sludge,
W74-11397 5D

Biotreatment Process,
W74-11398 5D

Ammonia Elimination System,
W74-11399 5D

Desalinzation System,
W74-11400 3A

Multiple Effect Evaporating Apparatus,
W74-11401 3A

Evaporating Method and Apparatus,
W74-11402 3A

Device and Apparatus for Treating Liquids Such as Drinking Water and Waste Water,
W74-11403 5D

Propelling Arrangement for Oil and Garbage Skimmer Craft,
W74-11404 5G

Water Treatment Filter Bed for Sewage Systems,
W74-11405 5D

Process for Treating Water,
W74-11406 5D

Polluted Water Purification,
W74-11407 5D

Acid Mine Water Treatment Process,
W74-11408 5D

Oil Skimmer Module with Free Floating Weir Trough,
W74-11409 5G

Sewage Flocculating and Sedimentation Tank Unit,
W74-11410 5D

Apparatus for Treating and Purifying Sewage, Particularly Sewage Contaminated with Detergents,
W74-11411 5D

Marina Protective Wave Breaker,
W74-11412 8B

Method for the Control of Oils Floating on Water,
W74-11413 5G

Distillation of Saline Water by Direct Contact Heat Exchange with Immiscible Liquid,
W74-11414 3A

Sewage Treatment Plant Equipped with an Aeration Impeller,
W74-11415 5D

Underwater Sewage Collection System for Docked Boats,
W74-11416 5D

PATH OF POLLUTANTS

Methods for the Direct Determination of Heavy-Metal Pollutants in the Environment,
W74-10923 5A

Symposium on Environmental Quality Monitoring; Symposium on Sources and Evolution of the Atmospheric Aerosol; General Papers.
W74-10947 5A

Environmental Analysis of Ocean Dumping,
W74-10977 5B

Transmethylation of Heavy Metal Ions in Water,
W74-10983 5B

The Flow of Trace Elements Through the Los Angeles Basin: Zn, Cd, and Ni,
W74-10987 5B

The Flow of Trace Elements Through the Los Angeles Area: Effect on Non-Urban Areas,
W74-10988 5B

Forecasting Oil Slick Behavior--A Preliminary Guide,
W74-11202 5B

Use of Neritic Trophodynamic Chain of Molluscs for the Study of the Transfer of Metallic Pollutants, (Utilisation D'une Chaine Trophodynamique De Type Neritique A Mollusques Pour L'etude Des Transferts Des Polluants Metalliques),
W74-11287 5C

Contamination of Marine Trophic Chains by Cobalt 60 (Consumption of Contaminated Arenicolae by Plaice and Crabs), (Contamination De Chaines Trophiques Marines Par Le Cobalt 60 (Consommation d'Arenicoles Contaminees Par Des Plies et Des Crabes)),
W74-11289 5C

Mercury Content in Feathers of Swedish Bir
from the Past 100 Years,
W74-11382 5

The Distribution of Trace Metals in the Sur
cial Sediments Surrounding Keweenaw Poi
Upper Michigan,
W74-11391 5

Underwater Copper Exploration in Lake S
perior Prospects Mapped in 1971,
W74-11392 5

Formation of Methylmercury in a Terrestr
Environment,
W74-11393 5

Digital Modeling of Radioactive and Chemic
Waste Transport in the Snake River Pla
Aquifer at the National Reactor Testing St
tion, Idaho,
W74-11439 5

Monitoring Toxaphene Contamination in
Georgia Estuary,
W74-11443 5

PATHOGENIC BACTERIA

A New Natural Factor in the Self-Purificati
of Water Basins (A Viztarolok Ontisztulasan
Uj Termeszetes Tenyezoje),
W74-10922 5

Effect of Water Salinity on the Incidence
Posthodiplostomum Infection in Fish, (In Ru
sian),
W74-10938 5

A Method for Rapid Identification of Typho
and Dysentery Bacteria in Water,
W74-11162 5

PENALTIES (LEGAL)

Damages from Pollution of Air and of Surfa
and Subterranean Waters,
W74-11158 6

PENNSYLVANIA

Hydraulic Performance of Pennsylvan
Highway Drainage Inlets Installed in Pave
Channels,
W74-11009 8

PERIPHYTON

A Comparison of the Macroinvertebrate Au
wachs in the Unstabilized and Stabilized Mi
souri River,
W74-11161 5

PERMEABILITY

Method of Treating Subterranean Formation
Improve Permeability,
W74-10931 8

PERMITS

Operator Certification Programs Applicable
Industrially Owned Waste Water Facilities,
W74-11100 5

PESTICIDES

Chlorinated Insecticide Residues in the Eggs
Some Freshwater Fish,
W74-11323 5

Monitoring Toxaphene Contamination in
Georgia Estuary,
W74-11443 5

PETROCHEMICALS

Activated Carbon Adsorption of Petrochem
cals,
W74-11086 5

IAEODACTYLUM TRICORNUTUM
Heavy Metal Tolerance of Marine Phytoplankton. I. The Tolerance of Three Algal Species to Zinc in Coastal Sea Water,
W74-11329 5C

IAEOPHYTA
The Effect of Polluted Water on The Assimilation Rate of The Brown Algae Ascophyllum Nodosum (L.) Le Jol. and Fucus Vesiculosus L.) (Preliminary Experiment),
W74-11284 5C

Influence of Salinity and Ionic Equilibrium on the Contamination of Arenicola Marina L. (Annelide: Polycheate) by Cesium-137, Influence de la Salinite et de L'Equilibre ionique Sur la Contamination D'Arenicola Marina L. (Annelide: Polychete) Par le Caesium-137.),
W74-11328 5C

IENOLS
Selective Adsorption of Phenols from Solution in Water,
W74-11063 5D

Growth Stimulation of Axenic Red Algae By Simple Phenolic Compounds,
W74-11346 5C

IOSPHATES
Purification Plant Eutin, Application of Simultaneous Precipitation for Phosphate Elimination, (Klaeranlage Eutin, Andwendung Der Simultanfaellung Zur Phosphateliminierung,),
W74-11247 5D

IOSPHOROUS
Determination of Total Phosphorous in Soils: A Rapid Perchloric Acid Digestion Procedure,
W74-11273 2G

IOSPHORUS
Agricultural Waste Water Accommodation and Utilization by Various Forages,
W74-10903 5D

Effect of Nitrogen and Phosphorus at Two Moisture Levels on the Status of the Available Zn, Cu, Mn and Fe in the Soil,
W74-10918 5B

The Phosphorus Status of Eutrophic Lake Sediments as Related to Changes in Limnological Conditions--Total, Inorganic and Organic Phosphorus,
W74-11131 5C

Rates of Growth and Nutrient Uptake of Irrigated Corn as Affected by N and P Fertilization,
W74-11263 3F

IOTOSYNTHESIS
Influence of Water Stress on Photosynthesis, Respiration and Leaf Growth of Zea Mays L.,
W74-11182 2I

IOTOTROPHS
Ecological Studies in Artificial Streams. III. The Seasonal Change in the Relationship of Heterotroph to Phototrophic Biomasses in Different Sewage Concentrations, (Okologische Untersuchungen an Modellfliessgewassern. III. Die Jahreszeitlichen Veranderungen im Verhaltnis Von Heterotropher Zu Phototropher Biomasse Bet Verschiedenen Abwasserblastungen),
W74-11317 5C

Ecological Studies in Artificial Streams. IV. Self Purification and Biomass Production in a Domestic Sewage Gradient, (Okologische Untersuchungen an Modelleliessgewassern. IV. Auswirkung der Selbsteinigung auf die Biomassebildung in Einem Abwassergradienten),
W74-11318 5C

PHYTOPLANKTON
The Growth Kinetics of Isochrysis Galbana in Cultures Containing Sublethal Concentrations of Mercuric Chloride,
W74-11340 5C

PIEZOELECTRIC SENSORS
A Piezoelectric Sensor for Mercury in Air,
W74-11003 5A

PIPE FOUNDATIONS
Recommendations for Installing PVC Gravity Sewer Piping,
W74-10919 8A

PIPELINES
Smoke Testing Pinpoints Surface Water Inflow,
W74-11082 8A

Steel Pipeline Design,
W74-11119 8A

Field Experience in the Sanitary-Hygienic Control of Pipe Lines in the Water Supply System, (in Russian),
W74-11186 5F

PIPES
Frost Protection for Waterlines.
W74-10910 8C

PLAICE
The Accumulation and Retention of 65Zn and 54Mn by the Plaice, Pleuronectes Platessa L.,
W74-11299 5C

The Accumulation and Retention of 59Fe and 58Co by the Plaice, Pleuronectes Platessa L.,
W74-11300 5C

PLANKTON
Evolution of The Plankton Biocenosis of Lake Annecy, (In French),
W74-11168 2H

PLANNING
A Systems Approach to Problem Oriented Research Planning: A Case Study of Food Production Wastes,
W74-11040 5G

PLANT TISSUE
Methodology of Plant Tissue Water Potential Determination by the Psychrometric Method,
W74-11188 2I

PLANTING MANAGEMENT
Restoration of an Oyster Resource Destroyed by Natural Causes,
W74-11163 8I

PLASTIC PIPES
Recommendations for Installing PVC Gravity Sewer Piping,
W74-10919 8A

PLASTICS
Artificial Aquifer Stops Storm Pollution.
W74-10929 5D

Plastic Valves Stand Up to Chlorine.
W74-11123 5F

PLATICHTHYES FLESUS
Ecological Implications of Heavy Metal in Fish from the Severn Estuary,
W74-11325 5C

PLATINUM
Transmethylation of Heavy Metal Ions in Water,
W74-10983 5B

PLEURONECTES PLATESSA
The Accumulation and Retention of 65Zn and 54Mn by the Plaice, Pleuronectes Platessa L.,
W74-11299 5C

The Accumulation and Retention of 59Fe and 58Co by the Plaice, Pleuronectes Platessa L.,
W74-11300 5C

The Accumulation from Sea Water of 65Zn, 54Mn, 58Co and 59Fe by the Thornback Ray, Raja Clavata L.,
W74-11304 5C

POLIOVIRUS
The Use of Magnetic Iron Oxide for Recovery of Virus From Water,
W74-10905 5D

POLLUTANT IDENTIFICATION
The Use of Magnetic Iron Oxide for Recovery of Virus From Water,
W74-10905 5D

Methods for the Direct Determination of Heavy-Metal Pollutants in the Environment,
W74-10923 5A

Methylation of Mercury in Lake and River Sediments During Field and Laboratory Investigations,
W74-10924 5B

A Preliminary Evaluation of a Discrete Sample Analyzer for Chemical Analysis of Water,
W74-10936 5A

Symposium on Environmental Quality Monitoring; Symposium on Sources and Evolution of the Atmospheric Aerosol; General Papers.
W74-10947 5A

Overview of the California Aerosol Characterization Experiment,
W74-10953 5A

Characterization and Analysis of Airborne Particulate Material by Infrared Spectroscopy,
W74-10957 5A

Sensors for Water and Wastewater Process Control,
W74-10958 5D

Monitoring the Aquatic Environment for Specific Organic Pollutants,
W74-10959 5A

Direct Determination of the Total Atmospheric Aerosol Mass Distribution,
W74-10967 5A

Automated Wet Chemical Analysis Instruments for Continuous Effluent Monitoring,
W74-10971 5D

Use of Chemical-Sensing Electrodes in Monitoring,
W74-10972 5A

Determination of Trace Organic Components in Aqueous Wastes,
W74-10974 5B

POLLUTANT IDENTIFICATION

Water Sampling,
W74-10975 5B

An Amperometric Membrane Halogen Analyzer,
W74-10980 5A

Trace Organic Contaminants in Drinking Water; Evaluation of Semi-Permeable Membranes and Osmotic Pumping to Achieve Concentration,
W74-10981 5F

Trace Organic Contaminants in Drinking Water; Their Concentration by Reverse Osmosis,
W74-10982 5F

Colorimetric Method for the Determination of Arsenic (III) in Aquatic Environment,
W74-10984 5A

The Carbon Rod Atomic Absorption Analysis of Arsenic in Plant and Animal Tissues,
W74-10985 5A

Evaluation of Digestion Techniques for the AAS Determination of Metal Concentrations in Kelp,
W74-10986 5A

The Determination of Benzidine in Wastewaters,
W74-10991 5A

Chemical Profiles of Kraft Paper Mill Treated Wastewaters,
W74-10992 5D

The Elemental Composition of the Aerosol in Pasadena, California,
W74-10994 5A

A Colorimeter System for Determination of The Method 6 Thorin Titration Endpoint,
W74-11001 5A

Operation Characteristics of NO2 Permeation Devices,
W74-11002 5A

A Piezoelectric Sensor for Mercury in Air,
W74-11003 5A

The Fluorescence Detection of Nitric Oxide,
W74-11004 5A

Chemical Analysis of the Smoky-Burnt Odor Complex in Diesel Exhaust,
W74-11005 5A

An Automated Instrument for the Continuous Measurement of Reactive Hydrocarbons,
W74-11007 5A

Intercomparison of Several Types of Cascade Impactors,
W74-11008 5A

Analyses of Paper Machine Waters with Ion-Specific Electrodes. Part I. Effect of pH and Ionic Strength of Solution on Calcium, Cupric, Chloride, Sodium, and Nitrate Ion Specific Electrodes,
W74-11093 5A

Analyses of Paper Machine Waters with Ion-Specific Electrodes, Part II. Calcium, Cupric, Chloride, Sodium and Nitrate Ion Specific Electrode Potentials at Various Temperatures and in Composite Solutions,
W74-11094 5A

The Determination of Vanadium in Sea Water by Hot Graphite Atomic Absorption Spectrometry on Chitosan After Separation from Salt,
W74-11109 5A

Fluorimetric Determination of Carbohydrates in Sea Water,
W74-11110 5A

Make Water Pollution Control a Meaningful Local Responsibility,
W74-11120 5A

History of Metal Pollution in Southern California Coastal Zone,
W74-11130 5A

How to Measure Ambient Pollution,
W74-11255 5A

Water and Effluent Instrumentation Made Simple,
W74-11258 5A

The Solvent Extraction Atomic Absorption Analysis of Effluents and Water,
W74-11260 5A

A Modified Ion Exchange Technique for the Determination of Stability Constants of Metal-Soil Organic Matter Complexes,
W74-11262 5A

Determination of Total Phosphorous in Soils: A Rapid Perchloric Acid Digestion Procedure,
W74-11273 2G

Determination of Lead Using Charged Particle Activation Analysis,
W74-11349 5A

Potentiometric Measurement of Copper in Seawater with Ion 1 = 1 Selective Electrodes,
W74-11350 5A

Spectrochemical Method For the Determination of 36 Elements in Industrial Effluent,
W74-11351 5A

Trace Metal Analysis in Water by Proton-Induced X-Ray Emission Analysis of Ion-Exchange Membranes,
W74-11355 5A

Determination of Total Mercury in Air by Charcoal Adsorption and Ultraviolet Spectrophotometry,
W74-11363 5A

Application of Chelating Ion Exchange Resins for Trace Element Analysis of Geological Samples Using X-Ray Fluorescence,
W74-11364 5A

Solvent Extraction for the Separation of Metals,
W74-11365 5A

The Determination of Trace Quantities of Molybdenum by Atomic Absorption Spectroscopy,
W74-11371 5A

Ion-Exchange Paper Chromatography of Metal Ions with Mixed Aqueous-Organic Solvents Containing Mineral Acid and a Selective Extractant,
W74-11374 5A

Lead-Poisoning Detector.
W74-11377 5A

Mercury Determinations in Natural Waters by Persulfate Oxidation,
W74-11378 5A

Mercury Content in Feathers of Swedish Birds from the Past 100 Years,
W74-11382 5A

Determination of Lead, Uranium, Thorium, and Thallium in Silicate Glass Standard Materials by Isotope Dilution Mass Spectrometry,
W74-11385 5A

Determination of Submicrogram Amounts of Mercury by the Oxygen Bomb Combustion Method,
W74-11388 5A

Analysis of Organic Mercury Compounds by Gas Chromatography,
W74-11390 5A

Design and Evaluation of a Vidicon Scanning Spectrometer for Molecular Absorption and Atomic Emission Spectrometry,
W74-11394 5A

Comparison of Observed and Calculated Concentrations of Dissolved Al and Fe in Stream Water,
W74-11422 5A

Determination of Trace Metals in Sodium Dithionite-Citrate Extracts of Soils and Sediments by Atomic Absorption,
W74-11425 5A

A Study of Oil Source Identification Techniques,
W74-11435 5A

The Determination of Mercury in Commercially Important Aquatic Organisms,
W74-11438 5A

POLLUTANTS

Evolution of Monitoring for Earthwatch,
W74-10948 5A

POLLUTION

History of Metal Pollution in Southern California Coastal Zone,
W74-11130 5A

Legal Controls of Pollution in the Great Lakes Basin,
W74-11417 5G

POLLUTION ABATEMENT

A Systems Approach to Problem Oriented Research Planning: A Case Study of Food Production Wastes,
W74-11040 5G

Floating Boom Deployment Apparatus,
W74-11046 5G

Water Aeration Equipment,
W74-11047 5D

Purifying Plant for Sewage,
W74-11052 5D

Sewage Treatment Apparatus,
W74-11053 5D

Floatable Boom Structure,
W74-11054 5G

Oil Slick Removal Method, System and Bag Therefor,
W74-11055 5G

nderwater Leakage Oil Collector System,

Toxicity Bioassays of Cadmium on Selected Freshwater Invertebrates and the Interaction of Cadmium and Zinc on the Freshwater Shrimp, Paratya Tasmaniensis Riek,
W74-11307 5C

Acute Toxicity of Unbleached Kraft Mill Effluent (UKME) to the Opossum Shrimp, Neomysis Americana Smith,
W74-11324 5C

SILICATES
Determination of Lead, Uranium, Thorium, and Thallium in Silicate Glass Standard Materials by Isotope Dilution Mass Spectrometry,
W74-11385 5A

SILVER IODIDE
Application of Biological Filters in Water Treatment Systems.
W74-11418 5D

SIMULATION ANALYSIS
A Finite Element Approach to Watershed Runoff,
W74-10937 2A

Computer Simulation of Waste Water Treatment by Chemical-Physical Processes,
W74-11037 5D

W.A.L.R.U.S. Water and Land Resource Utilization Simulation Player's Manual (Wisconsin Version),
W74-11041 6A

Dynamic Models and Control Strategies for Waste Water Treatment Processes,
W74-11069 5D

SKELETONEMA COSTATUM
Heavy Metal Tolerance of Marine Phytoplankton. I. The Tolerance of Three Algal Species to Zinc in Coastal Sea Water,
W74-11329 5C

SKIMMERS
Propelling Arrangement for Oil and Garbage Skimmer Craft,
W74-11404 5G

Oil Skimmer Module with Free Floating Weir Trough,
W74-11409 5G

SKIMMING
Propelling Arrangement for Oil and Garbage Skimmer Craft,
W74-11404 5G

SLOPES
Effect of Changes in Water Balance of Cultivated Fields on Erosion Processes (Vliyaniye izmeneniya vodnogo balansa sel'skokhozyaystvennykh poley na protsessy erozii),
W74-11011 2J

Surface Runoff and Soil Erosion in Foothills of Dagestan (O poverkhnostnom stoke i smyve pochv v predgor'yakh Dagestana),
W74-11450 2J

SLUDGE
Toxicity of Chromium Compounds Under Aerobic Conditions,
W74-11360 5C

SLUDGE DIGESTION
Digestion Byproduct May Give Answer to Energy Problem,
W74-10935 5D

SLUDGE TREATMENT
Modern Processes of Sludge Dewatering (Moderne Verfahren zur Schlammentwaesserung),
W74-11066 5D

Vacuum Filtration of Sludge,
W74-11084 5D

Use of the Multiroll Press for Dewatering Clarifier Sludge,
W74-11096 5D

The Effect of Surplus Activated Sludge in Filter Press Performance,
W74-11248 5D

Inverse Separation of Heat-Treated Sludge,
W74-11249 5D

The Effect of Heat Treatment on the Solubilization of Heavy Metals, Solids and Organic Matter From Digested Sludge,
W74-11250 5D

A Study of Conditioning Sewage Sludges with Lime,
W74-11251 5D

Some Effects of Metals Discharged in Effluents and Possibilities for Their Recovery,
W74-11366 5D

SLURRIES
Steel Pipeline Design,
W74-11119 8A

SMALL WATERSHEDS
Hydrologic Data for Mountain Creek, Trinity River Basin, Texas, 1972,
W74-11441 7C

Hydrologic Data for Pin Oak Creek, Trinity River Basin Texas, 1972,
W74-11442 7C

SMOG
Overview of the California Aerosol Characterization Experiment,
W74-10953 5A

Physical Characterization of California Aerosols,
W74-10954 5A

Photochemical Aerosol Formation in the Atmosphere and in an Environmental Chamber,
W74-10955 5B

Sulfate and Nitrate Chemistry in Photochemical Smog,
W74-10956 5A

H2SO4/(NH4)2SO4 Aerosol: Optical Detection in St. Louis Region,
W74-10965 5A

SO2 Oxidation Mechanism in Olefin-NOx-SO2 Smog,
W74-10966 5B

A Spectroscopic Study of Pasadena Smog,
W74-10995 5A

SMOKE
Smoke Testing Pinpoints Surface Water Inflow,
W74-11082 8A

SNOWLINE
Evaluation of Glacier Mass Balance by Observing Variations in Transient Snowline Positions,
W74-11437 2C

SODIUM
Growth, Mineral Composition, and Seed Oil of Sesame (Sesamum indicum L.) as Affected by Boron and Exchangeable Sodium,
W74-11278 3C

SODIUM LAURYL SULPHATE
Effect of Water Hardness on the Toxicity of an Anionic Detergent to Fish,
W74-11310 5C

SOIL COLUMNS
Soil Columns for Simulating Animal Manure Recycling,
W74-11242 5D

SOIL EROSION
Effect of Changes in Water Balance of Cultivated Fields on Erosion Processes (Vliyaniye izmeneniya vodnogo balansa sel'skokhozyaystvennykh poley na protsessy erozii),
W74-11011 2J

Erodibility of Soils Under Storm Runoff Conditions (Erodiruyemost' pochv v usloviyakh livnevogo stoka),
W74-11449 2J

Surface Runoff and Soil Erosion in Foothills of Dagestan (O poverkhnostnom stoke i smyve pochv v predgor'yakh Dagestana),
W74-11450 2J

SOIL MOISTURE
Interaction of Temperature and Moisture on Iron and Manganese Availability in Soils,
W74-10913 2G

Effect of Nitrogen and Phosphorus at Two Moisture Levels on the Status of the Available Zn, Cu, Mn and Fe in the Soil,
W74-10918 5B

An Improved Field Method for Determination of Discontinuous Capillary Moisture (Usovershenstvovannyy polevoy metod opredeleniya vlazhnosti razryva kapillyarnoy svyazi),
W74-11014 2G

Relationship Between Coefficients of Heat Conductivity and Thermal Moisture Conductivity of Soils (O svyazi mezhdu koeffitsiyentami temperaturoprovodnosti i termovlagoprovodnosti v pochvakh),
W74-11015 2G

Moisture Regime of Meadow Soils on the Oka River Flood Plain (Rezhim vlazhnosti poymennykh pochv okskikh lugov),
W74-11204 2G

Fall-Winter Development of the Buds of Some Trees in Relation to Soil Moisture Content, (In Byelorussian),
W74-11259 2G

Soil-Suction Measurements for Evaluation of Vertical Water Flow at Greater Depths with a Pressure Transducer Tensiometer,
W74-11274 2G

SOIL PHYSICS
Some Features of Water Infiltration into Soil During Sprinkler Irrigation (Nekotoryye osobennosti vpityvaniya vlagi v pochvu pri dozhdevanii),
W74-11013 2G

Rate of Evaporation of Water From Capillaries of Different Diameter Into Moist Air (Skorost' ispareniya vody iz kapillyarov raznykh diametrov vo vlazhnyy vozdukh),
W74-11448 2D

SOIL SUCTION MEASUREMENTS
Soil-Suction Measurements for Evaluation of Vertical Water Flow at Greater Depths with a Pressure Transducer Tensiometer,
W74-11274 2G

SOIL TEMPERATURE
Interaction of Temperature and Moisture on Iron and Manganese Availability in Soils,
W74-10913 2G

SOIL TYPES
Relationship Between Coefficients of Heat Conductivity and Thermal Moisture Conductivity of Soils (O svyazi mezhdu koeffitsiyentami temperaturoprovodnosti i termovlagoprovodnosti v pochvakh),
W74-11015 2G

SOIL WATER
Soil-Suction Measurements for Evaluation of Vertical Water Flow at Greater Depths with a Pressure Transducer Tensiometer,
W74-11274 2G

SOIL WATER MOVEMENT
Moisture Regime of Meadow Soils on the Oka River Flood Plain (Rezhim vlazhnosti poymennykh pochv okskikh lugov),
W74-11204 2G

SOIL-WATER-PLANT RELATIONSHIPS
Moisture Regime of Meadow Soils on the Oka River Flood Plain (Rezhim vlazhnosti poymennykh pochv okskikh lugov),
W74-11204 2G

SOIL-WATER-PLANT RELATIONSHIPS TRANSPIRATION
A New Ecophysiological Approach to Forest-Water Relationships in Arid Climates,
W74-11386 2I

SOILS
Soil Columns for Simulating Animal Manure Recycling,
W74-11242 5D

Determination of Trace Metals in Sodium Dithionite-Citrate Extracts of Soils and Sediments by Atomic Absorption,
W74-11425 5A

Erodibility of Soils Under Storm Runoff Conditions (Erodiruyemost' pochv v usloviyakh livnevogo stoka),
W74-11449 2J

SOILWATER
Crop Residue, Soil Water, and Soil Fertility Related to Spring Wheat Production and Quality After Fallow,
W74-11264 3F

SOLENT (UK)
The Occurrence of Some Trace Metals in Coastal Organisms with Particular Reference to the Solent Region,
W74-11332 5B

SOLID BOWL CENTRIFUGE
Scale-Up Solid Bowl Centrifuge Performance,
W74-10914 5D

SOLID WASTES
Scale-Up Solid Bowl Centrifuge Performance,
W74-10914 5D

Molecular Size and Spectral Characterization of Organic Matter in a Meromictic Lake,
W74-11067 2H

SOLUBILITY
The Effect of Heat Treatment on the Solubilization of Heavy Metals, Solids and Organic Matter From Digested Sludge,
W74-11250 5D

SOLVENT EXTRACTIONS
The Solvent Extraction Atomic Absorption Analysis of Effluents and Water,
W74-11260 5A

Solvent Extraction for the Separation of Metals,
W74-11365 5A

Ion-Exchange Paper Chromatography of Metal Ions with Mixed Aqueous-Organic Solvents Containing Mineral Acid and a Selective Extractant,
W74-11374 5A

SORGHUM
Turgor Differences and Water Stress in Maize and Sorghum Leaves During Drought and Recovery,
W74-11191 2I

Applied and Residual Nitrate-Nitrogen Effects on Irrigated Grain Sorghum Yield,
W74-11270 3F

SOUTH AFRICA
Urbanization and the Environment--Engineering Implications,
W74-11124 4C

SOUTH AFRICA (RICHARDS BAY)
Major Port Developments at Richards Bay with Due Regard to Preserving the Natural Environment,
W74-11125 2L

SOUTH AMERICA
Focus on Control of Water Pollution in Sao Paulo State and its Relationship to the Pulp and Paper Industries (Enfoque do controle de poluicoa das aguas no estado de Sao Paulo e seu relacionamento com as industrias de celulose e papel),
W74-11090 5D

SOUTH DAKOTA
Distribution of Total Mercury in the Fishes of Lake Oahe,
W74-11319 5B

SOUTHWEST US
River Mile Index, Sevier Lake Basin, Utah and Minor Basins in Western Utah and Eastern Nevada.
W74-11432 7C

SOYBEANS
Zinc Toxicity in Hydroponic Culture,
W74-11045 5C

SPECIES DIVERSITY
A Seasonal Survey of the Fishes in the Mystic River, a Polluted Estuary in Downtown Boston, Massachusetts,
W74-11302 5B

SPECIFIC CONDUCTANCE
CTD Sensors, Specific Conductance and the Determination of Salinity,
W74-11033 7B

SPECTROPHOTOMETRY
The Carbon Rod Atomic Absorption Analysis of Arsenic in Plant and Animal Tissues,
W74-10985 5A

Evaluation of Digestion Techniques for the AAS Determination of Metal Concentrations in Kelp,
W74-10986 5A

The Determination of Benzidine in Wastewaters,
W74-10991 5A

The Solvent Extraction Atomic Absorption Analysis of Effluents and Water,
W74-11260 5A

Determination of Total Mercury in Air by Charcoal Adsorption and Ultraviolet Spectrophotometry,
W74-11363 5A

SPECTROSCOPY
A Spectroscopic Study of Pasadena Smog,
W74-10995 5A

Spectrochemical Method For the Determination of 36 Elements in Industrial Effluent,
W74-11351 5A

The Determination of Trace Quantities of Molybdenum by Atomic Absorption Spectroscopy,
W74-11371 5A

Design and Evaluation of a Vidicon Scanning Spectrometer for Molecular Absorption and Atomic Emission Spectrometry,
W74-11394 5A

SPREADING
Effects of Spreading Manure on Groundwater and Surface Runoff,
W74-11240 5B

SPRINGS
Pierre Perrault: The Man and His Contribution to Modern Hydrology,
W74-11206 2A

Groundwater Discharge from the Edwards and Associated Limestones, San Antonio Area, Texas, 1973,
W74-11440 2F

SPRINKLER IRRIGATION
Some Features of Water Infiltration into Soil During Sprinkler Irrigation (Nekotoryye osobennosti vpityvaniya vlagi v pochvu pri dozhdevanii),
W74-11013 2G

Erodibility of Soils Under Storm Runoff Conditions (Erodiruyemost' pochv v usloviyakh livnevogo stoka),
W74-11449 2J

ST CLAIR RIVER
Mercury Pollution,
W74-11368 5B

ST. LOUIS (MO)
The Urban Plume of St. Louis,
W74-10964 5B

H2SO4/(NH4)2SO4 Aerosol: Optical Detection in St. Louis Region,
W74-10965 5A

STATE GOVERNMENTS
Rational Institutional Arrangements for Water Resources Management,
W74-10901 6E

Operator Certification Programs Applicable to Industrially Owned Waste Water Facilities,
W74-11100 5D

STATISTICAL MODELS
The Random Model in Fluvial Geomorphology,
W74-11035 8B

STEEL PIPELINES
Steel Pipeline Design,
W74-11119 8A

STIMULATION ANALYSIS
A Scheme for Assessing the Reliability of Interpolated Rainfall Estimates,
W74-10941 2B

STOMATA
The Density of Stomata in Leaves of Different Ecotypes of Phragmites communis,
W74-11253 2I

STORM DRAINS
Storm Drainage Systems Design Made Adaptable for Computers,
W74-10916 4A

Sewer-Within-Sewer Saves City $400,000,
W74-10921 5D

Problems on Pollution and Water Resources in the New York City Metropolitan Area,
W74-10942 5D

STORM RUNOFF
The Determination of Zones of Intense Contribution to Stream Flow as Related to the Concept of Partial Area Contributions,
W74-10904 2A

Artificial Aquifer Stops Storm Pollution.
W74-10929 5D

STORM WATER
Problems on Pollution and Water Resources in the New York City Metropolitan Area,
W74-10942 5D

STORMFLOW TREATMENT
Artificial Aquifer Stops Storm Pollution.
W74-10929 5D

STREAMFLOW
Autocorrelation Structure of Monthly Streamflows,
W74-11419 2E

SUBLETHAL EFFECTS
The Sublethal Effects of Environmental Variables on Polychaetous Annelids,
W74-11292 5C

Oxygen Consumption and Activity of the White Sucker (Catostomus Commersoni), In Lethal and Nonlethal Levels of the Organochlorine Insecticide, Methoxychlor,
W74-11320 5C

Heavy Metal Tolerance of Marine Phytoplankton. I. The Tolerance of Three Algal Species to Zinc in Coastal Sea Water,
W74-11329 5C

Effects of Crude Oil on the Feeding Behavior of the Lobster Homarus Americanus,
W74-11333 5C

Sublethal Effects of Several Metallic Salts-Organic Compounds Combinations Upon the Heterotrophic Microflora of a Natural Water,
W74-11352 5C

SUBMERGED LANDS ACT
Bonelli Cattle Company V. State of Arizona (Action Brought by Riparian Owner to Quiet Title to Land Which Was Once Submerged Under Colorado River).
W74-11152 6E

BSURFACE DRAINAGE
Method of Treating Subterranean Formation to Improve Permeability,
W74-10931 8B

CCESSION
The Distribution and Succession of Aquatic Vascular Plant Communities in Relation to Physical-Chemical Characteristics of Various Lakes and Ponds of The Tanana Valley, Central Alaska,
W74-11282 5C

Changes and Succession in The Benthic Algal Associations of Slightly Polluted Habitats,
W74-11286 5C

CKERS
Oxygen Consumption and Activity of the White Sucker (Catostomus Commersoni), In Lethal and Nonlethal Levels of the Organochlorine Insecticide, Methoxychlor,
W74-11320 5C

DANGRASS
Residual Effects of N15-Labeled Fertilizers in a Field Study,
W74-11276 3F

Priming Effect of N-15 Labeled Fertilizers on Soil Nitrogen in Field Experiments,
W74-11279 5B

LFAMERAZINE
Sulphamerazine Toxicity in Cut-Throat Trout Broodfish Salmo clarki (Richardson),
W74-11068 5C

LFATES
Sulfate and Nitrate Chemistry in Photochemical Smog,
W74-10956 5A

H2SO4/(NH4)2SO4 Aerosol: Optical Detection in St. Louis Region,
W74-10965 5A

SO2 Oxidation Mechanism in Olefin-NOx-SO2 Smog,
W74-10966 5B

The Production Rate of Sulfate Aerosol in the Stratosphere: Environmental Implications of a Stratospheric Aircraft Fleet,
W74-10999 5B

A Colorimeter System for Determination of The Method 6 Thorin Titration Endpoint,
W74-11001 5A

LFUR COMPOUNDS
Control of Sulfur Oxide Pollution from Power Plants,
W74-11431 5G

LFUR DIOXIDE
A Colorimeter System for Determination of The Method 6 Thorin Titration Endpoint,
W74-11001 5A

LFURIC ACID
H2SO4/(NH4)2SO4 Aerosol: Optical Detection in St. Louis Region,
W74-10965 5A

SO2 Oxidation Mechanism in Olefin-NOx-SO2 Smog,
W74-10966 5B

SURFACE RUNOFF
Erodibility of Soils Under Storm Runoff Conditions (Erodiruyemost' pochv v usloviyakh livnevogo stoka),
W74-11449 2J

Surface Runoff and Soil Erosion in Foothills of Dagestan (O poverkhnostnom stoke i smyve pochv v predgor'yakh Dagestana),
W74-11450 2J

SURFACE WATER
Hygienic Evaluation of Surface Waters in the Transcarpathian Region, (In Russian),
W74-11171 5B

Quality of Berlin Surface Waters: Measuring Scheme, (Das Gutemess Programm Der Berliner Oberflachengewasser),
W74-11252 5A

Legal Controls of Pollution in the Great Lakes Basin,
W74-11417 5G

SURFACE WATERS
Smoke Testing Pinpoints Surface Water Inflow,
W74-11082 8A

The Hydrology of the Lexington and Fayette County, Kentucky Area,
W74-11201 4A

SURGES
Long Wave Excitation in Harbours--An Analytical Study,
W74-11031 8B

SURKHOB RIVER BASIN (USSR)
Catalog of USSR Glaciers. Volume 14. Soviet Central Asia. No. 3. Amu-Dar'ya. Part 6. Surkhob River Basin Between Mouths of the Obikhingou and Muksu Rivers (Katalog lednikov SSSR. Tom 14. Srednyaya Aziya. Vypusk 3. Amu-Dar'ya. Chast' 6. Basseyn r. Surkhob mezhdu ust'yami rek Obikhingou i Muksu),
W74-11215 2C

SURVEYING INSTRUMENTS
An Empirical Study of Light Path Behavior, and Application of the Findings to the Design of Precise Surveying Systems for Dam Alignment.
W74-11212 8A

SURVEYS
An Empirical Study of Light Path Behavior, and Application of the Findings to the Design of Precise Surveying Systems for Dam Alignment.
W74-11212 8A

SURVIVAL
The Sublethal Effects of Environmental Variables on Polychaetous Annelids,
W74-11292 5C

SUSPENDED LOAD
Quality of Water and Suspended Sediments in the Baksan and Malka Rivers (O kachestve vody i vzveshennykh nanosov rek Baksana i Malki),
W74-11012 5B

SUSPENDED SOLIDS
The Effect of Hydrometeorological Conditions on the Zeta-Potential of Suspended Solids (Hidrometeorologiai viszonyok hatasa a lebego anyagok Zeta-potencialjara),
W74-10907 5B

Efficiency Tests for Microstrainer Waste Treatment, (Maikuro sutorena ni yoru shorisui kojo shiken),
W74-10915 5D

Quality of Water and Suspended Sediments in the Baksan and Malka Rivers (O kachestve vody i vzveshennykh nanosov rek Baksana i Malki),
W74-11012 5B

Effluent Polishing with a Biological Filter,
W74-11081 5D

Possibilities of Using Chemical-Physical Purification Process for Waste Waters (Einsatzmoeglichkeiten chemischphysikalischer Reinigungsverfahren bei Restabwaessern),
W74-11099 5D

Advanced Waste Treatment Process Selection, Part Three,
W74-11135 5C

SUSPENSION
Flocculation of Aqueous Quartz Suspensions with Neutral and Cationic Polymers in the Presence of Co(II), Ca(II), or Fe(III),
W74-11235 5D

SWEDEN
The Avifauna of Sweden as Indicators of Environmental Contamination with Mercury and Chlorinated Hydrocarbons,
W74-11367 5B

SWIMMING POOLS
Investigations on the Viability of Trichomonas Vaginalis in Tap Water and Public Swimming Pools, (in Russian),
W74-11193 5B

SYRDAR'YA RIVER (USSR)
Catalog of USSR Glaciers. Volume 14. Soviet Central Asia. No 1. Syrdar'ya. Part 4. (Katalog lednikov SSSR. Tom 14. Srednyaya Aziya. Vypusk 1. Syrdar'ya. Chast' 4.),
W74-11217 2C

Catalog of USSR Glaciers. Volume 14. Soviet Central Asia. No. 1. Syrdar'ya. Part 6. Atbashi River Basin (Katalog lednikov SSSR. Tom 14. Srednyaya Aziya. Vypusk 1. Syrdar'ya. Chast' 6. Basseyn r. Atbashi),
W74-11220 2C

SYSTEMS ANALYSIS
A Systems Approach to Problem Oriented Research Planning: A Case Study of Food Production Wastes,
W74-11040 5G

TAINT
A Kerosene-Like Taint in the Sea Mullet, Mugil Cephalus (Linnaeus) I. Composition and Environmental Occurrence of the Tainting Substance,
W74-11312 5C

TANANA VALLEY (AK)
The Distribution and Succession of Aquatic Vascular Plant Communities in Relation to Physical-Chemical Characteristics of Various Lakes and Ponds of The Tanana Valley, Central Alaska,
W74-11282 5C

TECHNOLOGY ASSESSMENT
A Systems Approach to Problem Oriented Research Planning: A Case Study of Food Production Wastes,
W74-11040 5G

TEMPERATURE
The Combined Effect of High Salinity and Temperature on the Survival of Young Limanda Limanda,
W74-11314 5C

TEMPERATURE DISTRIBUTION
Localized Thermal Pollution in Shallow Streams, (Near-Field Temperature Distributions),
W74-10902 5B

TENORITE
The Concentration Control of Soluble Copper in a Mine Tailings Stream,
W74-11361 5B

TENSIOMETERS
Soil-Suction Measurements for Evaluation of Vertical Water Flow at Greater Depths with a Pressure Transducer Tensiometer,
W74-11274 2G

TERTIARY TREATMENT
Advanced Waste Treatment Process Selection, Part Three,
W74-11135 5C

TESTING PROCEDURES
Smoke Testing Pinpoints Surface Water Inflow,
W74-11082 8A

Total Oxygen Demand: A New Tool for Wastewater Analysis,
W74-11083 5D

TEXAS
Groundwater Discharge from the Edwards and Associated Limestones, San Antonio Area, Texas, 1973,
W74-11440 2F

Hydrologic Data for Mountain Creek, Trinity River Basin, Texas, 1972,
W74-11441 7C

Hydrologic Data for Pin Oak Creek, Trinity River Basin Texas, 1972,
W74-11442 7C

THAILAND (BANGKOK)
A Field Trial of Abate Larvicide for the Control of Aedes aegypti in Bangkok, Thailand,
W74-10934 5G

THALASSIOSIRA PSEUDONANA
Heavy Metal Tolerance of Marine Phytoplankton. I. The Tolerance of Three Algal Species to Zinc in Coastal Sea Water,
W74-11329 5C

THALLIUM
Determination of Lead, Uranium, Thorium, and Thallium in Silicate Glass Standard Materials by Isotope Dilution Mass Spectrometry,
W74-11385 5A

THERMAL CONDUCTIVITY
Relationship Between Coefficients of Heat Conductivity and Thermal Moisture Conductivity of Soils (O svyazi mezhdu koeffitsiyentami temperaturoprovodnosti i termovlagoprovodnosti v pochvakh),
W74-11015 2G

THERMAL PLUMES
Localized Thermal Pollution in Shallow Streams, (Near-Field Temperature Distributions),
W74-10902 5B

THERMAL POLLUTION
Localized Thermal Pollution in Shallow Streams, (Near-Field Temperature Distributions),
W74-10902 5B

Potential Effects of Thermal Discharges on Aquatic Systems,
W74-11107 5C

The Use of a Mobile Laboratory to Study Temperature Response of Fish,
W74-11297 5C

Effects of Heated Effluent on Hermatypic Corals at Kahe Point, Oahu,
W74-11303 5C

Effect of Thermal Effluent on Migrating Menhaden,
W74-11305 5C

Copepod and Chlorophyll a Concentrations in Receiving Waters of a Nuclear Power Station and Problems Associated With Their Measurement,
W74-11343 5B

Process for Treating Water,
W74-11406 5D

THICKENERS
Sedimentation: An Introduction to Solids Flux Theory,
W74-11261 5D

THORIUM
Determination of Lead, Uranium, Thorium, and Thallium in Silicate Glass Standard Materials by Isotope Dilution Mass Spectrometry,
W74-11385 5A

TIDAL EFFECTS
Well-Mixed Estuaries with Nonlinear Resistance,
W74-11137 2L

TIME
The Combined Effect of High Salinity and Temperature on the Survival of Young Limanda Limanda,
W74-11314 5C

TIME SERIES ANALYSIS
Autocorrelation Structure of Monthly Streamflows,
W74-11419 2E

TITANIUM
Effects on Hepatocytes in Cell Cultures at Various Combinations of Heavy Metals Present in Titanium Waste Waters, (Action Sur Des Hepatocytes en Culture Histiotypique, de Divers Composes Metalliques Presents Dans Les Eaux Residuaires de l'Industries du Titane),
W74-11296 5C

Filter Pore-Size Effects on the Analysis of Al, Fe, Mn, and Ti in Water,
W74-11421 5A

TOMATOES
The Effects of Nitrogen, Potassium, and Subirrigation on the Yield, Quality, and Composition of Single-Truss Tomatoes,
W74-11048 3F

Mercury Contamination of Vegetation Due to the Application of Sewage Sludge as a Fertilizer,
W74-11133 5A

TORONTO
Direct-Filtration Studies for Metropolitan Toronto,
W74-10928 5D

TOTAL OXYGEN DEMAND
Total Oxygen Demand: A New Tool for Wastewater Analysis,
W74-11083 5D

TOXAPHENE
Monitoring Toxaphene Contamination in a Georgia Estuary,
W74-11443 5B

TOXIC WASTES
Ocean Incineration of Toxic Wastes.
W74-11132 5E

TOXICITY
Effects of Dietary Mercury on Mink,
W74-10930 5C

Zinc Toxicity in Hydroponic Culture,
W74-11045 5C

Sulphamerazine Toxicity in Cut-Throat Trout Broodfish Salmo clarki (Richardson),
W74-11068 5C

Fish Toxicity Survey of Four Prairie Province Pulp Mill Effluents,
W74-11075 5C

Factors Affecting Acute Toxicity Bioassays with Pulp Mill Effluent,
W74-11076 5C

Laboratory and Controlled Experimental Stream Studies of the Effects of Kraft Effluents on Growth and Production of Fish,
W74-11087 5C

Effects on Hepatocytes in Cell Cultures at Various Combinations of Heavy Metals Present in Titanium Waste Waters, (Action Sur Des Hepatocytes en Culture Histiotypique, de Divers Composes Metalliques Presents Dans Les Eaux Residuaires de l'Industries du Titane),
W74-11296 5C

Investigations on the Toxicity of Sea Water-Extracts of Three Crude Oils on Eggs of Cod (Gadus Morhua L.),
W74-11298 5C

The Influence of Certain Toxic Substances, Contained in Domestic Wastes, on the Bacteria Escherichia Coli and Pseudomonas Flourescens, (L'Influence De Certaines Substances Toxiques, Contenues Dans Les Eaux D'egouts Municipaux, Sur Les Bacteries Escherichia Coli Et Pseudomonas Flourescens),
W74-11301 5C

Toxicity Bioassays of Cadmium on Selected Freshwater Invertebrates and the Interaction of Cadmium and Zinc on the Freshwater Shrimp, Paratya Tasmaniensis Riek,
W74-11307 5C

Effect of Water Hardness on the Toxicity of an Anionic Detergent to Fish,
W74-11310 5C

The Toxicity of Some Forms of Copper to Rainbow Trout,
W74-11315 5C

The Toxicity of Zinc Sulphate to Rainbow Trout in Very Hard Water,
W74-11321 5C

Acute Toxicity of Unbleached Kraft Mill Effluent (UKME) to the Opossum Shrimp, Neomysis Americana Smith,
W74-11324 5C

Ichthyotoxic Effects of Some Anti-Pollution Products,

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 7, NUMBER 22
NOVEMBER 15, 1974

JAN 03 1975

W74-11451 -- W74-12000

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription rates are: To the SWRA Journal, $75 ($95 foreign); to the Journal & Annual Index $100 ($125 foreign); to the Annual Index only, $50 ($65 foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 7, NUMBER 22
NOVEMBER 15, 1974

W74-11451 -- W74-12000

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

MOLECULAR MECHANISMS OF CONDUCTION AND POLARIZATION IN WATER VAPOR, LIQUID WATER, AND ICE,
Massachusetts Inst. of Tech., Cambridge. Insulation Research Lab.
A. Von Hippel.
Available from NTIS, Springfield, Va. 22161 as AD-762 060, Price $3.00 printed copy; $2.25 microfiche. Technical Report 12, May 1973. 27 p, 22 fig, 1 tab, 51 ref. ONR Contract N00014-67-A-0204-0053.

Descriptors: *Water properties, *Electrical properties, Electrolytes, Hydrogen bonding, Ice, Water vapor, Electrical conductance, Electrical resistance, Resistivity, Electrochemistry, Ionization, Physics, Water structure.

The molecular processes in water, vapor, and ice of conduction and polarization are discussed. The prerequisite for thermal ionization is the formation of association complexes that allow subsequent dissociation by infrared vibrations. In first approximation the ionization equilibrium can be treated by a bimolecular reaction equation; foreign ions and molecules can act as catalysts or suppressors. The corresponding process occurs in water and data are available for a more detailed analysis. The temperature and pressure dependence of the ionic product shows that the ionization by vibrations becomes increasingly difficult at high temperatures. It seems likely that the proton behaves classically, because its mass is greatly increased by a 'proton polaron' effect. Perfect ice single crystals seem to be insulators. Ionic-defect-pair formation in perfect ice single crystals may be much more expensive than previously assumed, because the partners are unshielded against each other; the migration of the defects seems to be interdicted by antipolarization; and the proton polaron effect would prevent tunneling. Journal of Hydrology, Vol 22, No 1/2, p 143-153, June 1974. 5 fig, 2 tab, 13 ref.

Descriptors: *Unit hydrographs, *Watersheds(Basins), *Rainfall-runoff relationships, *Geographical regions, Hydrology, Hydrograph analysis, Storm runoff, Drainage areas, Small watersheds, Forest watersheds, Floods, *Pennsylvania, Appalachian mountain region.
Identifiers: *Ungaged watersheds.

A study was made of 96 flood events, larger than the mean annual flood, from 17 catchments situated in different regions of the Commonwealth of Pennsylvania, an area of widely differing geology, physiography and climate. The mean annual precipitation ranges from 90 to 124 cm, mean monthly temperatures vary from a minimum of -3 C in January to 24C in July, and mean elevation differences within a catchment range from 220 to 875 m; catchment sizes are 10 to 450 sq km. Unit hydrographs, derived by the least-squares method on a digital computer, show some consistency of shape for one catchment but very considerable variations among catchments. Storm parameters seem to have small effects on the unit hydrographs but physiographic parameters cause the major inter-catchment variations in the shapes of the unit hydrographs. The baselength of the unit hydrograph is found to be closely related to the physiographic region while the time-to-peak and the peak discharge seem to be dependent on area and other associated physiographic parameters. It is possible within the ranges of catchment size and physiographic regions studied to develop unit hydrographs for ungaged watersheds, from which flood hydrographs and characteristic discharges may be derived. WHAT IS, AND WHAT IS NOT, A MARKOV CHAIN,
Lancaster Univ., Bailrigg (England). Dept. of Mathematics.
E. H. Lloyd.
Journal of Hydrology, Vol 22, No 1/2, p 1-28, June 1974. 7 tab, 6 ref.

Descriptors: *Markov processes, *Mathematical models, *Statistical models, *Synthetic hydrology, Statistical methods, Probability, Mathematics, Model studies, Stochastic processes, Time series analysis.

The expository paper was written in response to the increasing use of Markovian models to represent hydrological phenomena. The more familiar properties of simple (1-step) Markov chains are outlined, non-simple (k-step) chains and bivariate chains are described, and some fallacies associated with the transition probabilities of non-Markov chains are discussed. Some attention is devoted to the problems of selecting a model for use in practical situations. (Humphreys-ISWS)

J. Y. Ding.
Journal of Hydrology, Vol 22, No 1/2, p 53-69, June 1974. 8 fig, 1 tab, 19 ref.

Descriptors: *Unit hydrographs, *Flood routing, *Watersheds(Basins), *Rainfall-runoff relationships, Hydrography analysis, Rates, Recession curves, Routing, Runoff, Storm runoff, Hydrologic models.

A three-parameter, nonlinear, generalized Muskingum routing model is solved by the direct integration method. A two-parameter, variable instantaneous unit hydrograph (IUH) model is obtained from the generalized Muskingum model by the S-hydrograph method. The ordinates of the variable IUH vary directly and the time elements inversely, with the intensity of effective rainfall raised to a power between zero and one. The method of differential correction is used to obtain estimates of the model parameters from complex storm events. (Humphreys-ISWS)

STUDIES ON RUNOFF CHARACTERISTICS IN CHANNEL NETWORK SYSTEMS IN LOW LAND,
E. Toyokuni, and M. Watanabe.
Memoirs of the Ehime University, Section III, Engineering, Vol 8, No 1, p 29-48 1974. 23 fig, 1 tab, 10 ref.

Descriptors: *Measurement, *Runoff, *Simulation analysis, *Model studies, Inundation, Discharge, Surface waters, *Open channel flow.
Identifiers: Channel networks, *Japan(Low lands), Water surface gradients.

The methods of discharge measurement for open-channels in low land, using the data of water surface gradient and water stage, are discussed with

respect to the fundamental equation for unsteady flow. These are examined by hydraulic experiments. A runoff model of channel network systems is investigated and is verified. Using this simulation model, the characteristics of channel flow associated with inundation and the runoff characteristics are researched by means of digital simulation, increasing the applications of this model. Descriptors: *Urban runoff, *Urban hydrology, *Hydrologic models, *Hydrograph analysis, Runoff, Storm runoff, Surface runoff, Urban drainage, Mathematical models, Mathematics, Design, Hydrologic data, Analytical techniques, Drainage, Rainfall-runoff relationships, Watersheds(Basins), Recession curves, Routing, Runoff coefficient, Time of concentration, Hydraulics, Hyetographs, Rainfall, Graphical analysis.
Identifiers: *Linearized subhydrographs, Superposition, Subbasins.

A simple and accurate hydrography method for practical application in engineering offices was developed utilizing the principle of mass conservation, simple parameters, and functional relationships between rainfall and runoff. Runoff coefficient was used to compute the peak rates of runoff. Linear variation of the rising limb and the receding limb of the subhydrographs for a small basin was assumed. Kinematic wave time to equilibrium was used as a factor for the determination of subhydrographs. The method was applied to the typical urban drainage basin at Oakdale Avenue, Chicago, for two storms. The predicted hydrographs and the recorded hydrographs were in good agreement in time synchronization, and the predicted peak rates of runoff were close to the recorded ones. (Humphreys-ISWS)

A CONTRIBUTION TO STATISTICAL DEPTH-DURATION-FREQUENCY ANALYSIS,
Cagliari Univ. (Italy). Inst. of Hydraulics.
C. Cao.
Journal of Hydrology, Vol 22, No 1/2, p 109-129, June 1974. 8 fig, 5 tab, 9 ref.

Descriptors: *Rainfall disposition, *Statistical methods, *Duration curves, *Hydrologic data, Frequency curves, Frequency analysis, Mathematics, Stochastic processes, Data processing, Networks, Rainfall, Stations, Time.
Identifiers: *Sardinia, *Depth-duration-frequency analysis.

Present methods of evaluating the depth-duration-frequency relationship to be assumed for any given location are not completely satisfactory because of the uncertainty due to the low density of recording station networks and the assumed significance of every difference between stations. A new procedure is suggested with the aim of taking full advantage of all the information at hand. The procedure is based on the grouping of stations exhibiting homogeneous characteristics and on the use of the one-day rainfall characteristics available from the much more numerous non-recording stations. Station grouping is accomplished under rigorous statistical control by means of analysis of variance theory while a convenient statistical criterion is given to relate the one-day depth distribution to the shorter duration depth characteristics. Moreover, a new method for the depth-duration-frequency analysis of point rainfall is suggested on the basis of linear regression theory. Although not completely rational from a statistical point of view, because of the lack of independence between observations, the method is believed to be superior to the ones commonly used. As an example, an application to the 35 stations in the rain-gauge network of Sardinia is reported. (Humphreys-ISWS)

RAINFALL INTENSITIES IN THE CONTERMINOUS UNITED STATES AND HAWAII (SUPPLEMENT 1 TO ETL-SR-72-5: DISTRIBUTION OF MEAN MONTHLY PRECIPITATION AND RAINFALL INTENSITIES),
Army Engineer Topographic Labs., Fort Belvoir, Va. Geographic Sciences Lab.
T. E. Niedringhaus.
Available from NTIS, Springfield, Va. 22161 as AD-775 459, Price $3.25 printed copy; $2.25 microfiche. Report ETL-SR-74-3, November 1973. 28 p, 18 fig, 8 ref.

Descriptors: *Rainfall intensity, *Maps, *United States, Depth-area-duration analysis, Probability, *Precipitation intensity, Statistics, *Hawaii.

Maps are presented to show the distribution of rainfall intensities for duration of 5, 30, and 60 minutes and return periods of 10, 25, and 100 years within the conterminous United States and Hawaii. Data for excessive precipitation from 54 United States weather stations were also subjected to extreme value analysis. The extreme value analysis suggested that the Great Plains may have somewhat higher intensities than indicated on the map and that the 5-minute intensities are somewhat more variable over short distances than are the 30-minute intensities. The highest rainfall intensities occurring within the study area are in Hawaii where some mountainous sections can expect 8 inches of rain within a 60-minute period at least once every 100 years. Information is also presented on the relationship between rainfall intensity and raindrop size. (Knapp-USGS)

Journal of Hydrology, Vol 22, No 1/2, p 179-193, June 1974. 11 fig, 2 tab, 12 ref.

Descriptors: *Hydrologic data, *Hydrologic aspects, *Watersheds(Basins), *Hurricanes, Hydrographs, Floods, Surface runoff, Rain, *Pennsylvania, Appalachian Mountain Region, Storms, Hydrology.
Identifiers: *Hurricane Agnes, East Mahantango Creek Watershed(Pennsylvania).

The greatest rainfall amounts from the June 1972 tropical storm that devastated the Susquehanna river valley occurred over the East Mahantango Creek Watershed. This 162 sq mile area in the Ridge and Valley Province of eastern Pennsylvania is a densely instrumented research watershed, operated by the Agricultural Research Service of the USDA. Instrumentation includes 33 20-inch capacity, digital recording rain gages, and seven stream gaging sites. Data from tropical storm Agnes were analyzed with respect to watershed yield and return period frequency. Antecedent conditions and events preceding the storm are discussed. The maximum rainfall in this storm was 14.9 inches for 24 h and 18.2 inches for the entire storm (3 days). Partial and complete runoff records are presented for areas of 162, 76.1, 44.6, 10.1, 2.77 and 0.76 sq miles. The peak flow at the 162-sq mile point was over 400 csm (cu ft/sec/sq mile) and at the 10.1-sq mile watershed, over 1,200 csm. The rainfall and runoff events were several times greater than those expected for return period frequency of 100 years. Data from the 2.77-sq mile watershed indicate that runoff rates in the latter part of the storm were approximately equal to the rainfall rates. (Humphreys-ISWS)

EVAPORATION LOSSES FROM CONTAINERS OF HELLMANN PRECIPITATION GAUGES,
Eidgenoessische Technische Hochschule, Zurich (Switzerland).
B. Sevruk.
Hydrological Sciences Bulletin, Vol 19, No 2, p 231-236, Jun 1974. 3 fig, 1 tab, 29 ref.

Descriptors: *Precipitation gauges, *Evaporation, Rain gauges, Precipation(Atmospheric), Instrumentation, Water loss, Regression analysis, Temperature.
Identifiers: *Hellmann precipitation gauge.

The evaporation losses from the container of an old galvanized Hellmann gauge, 7.1 sq cm aperture area, were five times greater than the losses from the container of a new gauge, 1.8 sq cm aperature area, of almost the same grey color. The maximum evaporation from the old gauge amounted to 0.75 mm per day. The same evaporation losses in the

Baye of Montreux basin over a period of 10 years from April to September amounted to 0.09 mm per measurement or to 0.7 per cent of the precipitation catch. There was a relationship between the monthly percentage evaporation losses and the ratio of evaporation time and rainfall duration. (Humphreys-ISWS)

Identifiers: USSR.

Thawing of snow under any meteorological conditions can be calculated from the solar radiation and average daily temperature of air. The following information from high-altitude stations is necessary: average daily temperature of air; form and amount of overall and low cloudiness; duration of solar radiation; amount, type, and time of precipitation; and visual determinations of the structure and moisture content of snow, and the degree of contamination of the surface. The actual value of the albedo of snow cover must be determined. (Knapp-USGS)

Descriptors: *Ice cover, *Great Lakes, *Lake ice, Iced lakes, Surveys, *Data collections, Limnology.

Visual aerial ice reconnaissance flights over the Great Lakes provided data from which 59 ice charts depicting ice cover extent and characteristics were constructed. Temperatures were generally below normal during the 1970-71 winter. Bay and harbor ice formation was first reported November 25, 1970 on Lake Superior. The time of greatest ice extent for individual Great Lakes varied from February to March. During this period maximum ice covers were estimated to be: Lake Superior, 48 percent; Lake Michigan, 27 percent; Lake Huron, 45 percent; Lake Erie, 92 percent; and Lake Ontario, near 10 percent. Ice covers began to diminish by early March, mainly on the lower lakes. By the end of April all lakes were relatively ice free; however, ships continued to experience problems with ice as late as May 8 in eastern Lake Erie and May 12 at the Soo locks. (Knapp-USGS)

THE EFFECT OF INORGANIC NUTRIENTS ON WATER ECONOMY AND HARDINESS OF CONIFERS: I. THE EFFECT OF VARYING POTASSIUM, CALCIUM AND MAGNESIUM LEVELS ON WATER CONTENT, TRANSPIRATION RATE AND THE INITIAL PHASE OF DEVELOPMENT OF FROST HARDINESS OF PINUS SILVESTRIS L. SEEDLINGS,
Lund Univ. (Sweden). Dept. of Plant Physiology.
L. Christersson.
Stud For Suec. 103, p 1-26, 1973. Illus.

Descriptors: *Transpiration, *Scotch pines, Nutrients, Inorganic compounds.
Identifiers: Frost hardiness, Seedlings.

A hardening period of 3 wk (short days:8 hr light, and low temperature:3C) decreased the water content of the shoots by 1-6%, and the transpiration rates by about 50%. Increased K content increased the water content of the shoot, but decreased the transpiration rate. Increased Mg content increased the water content, but did not affect transpiration rate. Increased Ca content had no significant effect on water content or transpiration rate. Different contents of K, Ca and Mg had very little or no effect on frost hardiness in unhardened or 3-wk hardened seedlings. A transport of K from the root to the shoot during hardening was demonstrated; this transport is discussed in connection with winter survival.--Copyright 1974, Biological Abstracts, Inc.

Journal of Hydrology, Vol 22, No 1/2, p 131-142, June 1974. 6 fig, 2 tab, 10 ref.

Descriptors: *Urban hydrology, *Weather patterns, *Radar, *Remote sensing, Cities, Storms, Timing, Weather data, Weather, Precipitation(Atmospheric), Rain, Weather forecasting, *Canada.
Identifiers: *Ottawa, Basement flooding.

The radar and raingauge records of summer storms occurring over the city of Ottawa between 1969 and 1972 were used to study seven events which lead to the flooding of house basements. It was found that these tended to occur as a result of slow moving storms and on one occasion due to a storm elongated in its direction of travel. These features of storm dynamics appeared to be more important than either the intensity of the storm (maximum instantaneous rainfall rate) or the total accumulation. A brief discussion of the match between the scale of resolution of the radar and the watershed scale size in urban areas is included. (Humphreys-ISWS)

Descriptors: *Watersheds(Basins), *Model studies, *Hydrologic systems, *Runoff, Hydrologic equation, Regional analysis, Hydrology, Rainfall-runoff relationships, Discharge(Water), Hydrographs, Flood control, Flood forecasting, Hydraulics, Hydrologic properties, Surface waters, Storm drains, Urban hydrology, Peak discharge.
Identifiers: *Computer application.

The Metropolitan Sanitary District of Greater Chicago has developed a computer program system to simulate flood flows in Chicago area waterways. The basic algorithms employed in the programming are presented. Descriptions of input data requirements and output information are presented. A comparison of results with gaging records is included. The results of various test runs of the Flow Simulation System demonstrated the program's ability to reproduce past flood events and serve as justification for using the system in the analysis and design of flood control works by the Metropolitan Sanitary District. The question of transferability from watershed to watershed is a prime consideration in evaluating hydrological models. The system has proven to meet the test of transferability in the Chicago Region. All of the results presented were arrived at without modification of the programming or the constants involved. ESTIMATION OF STREAMFLOW UNDER ICE COVER,
Research Inst. for Water Resources Development, Budapest (Hungary).
J. Szilagyi, and L. Muszkalay.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 228-236, 1973. 5 fig.

Descriptors: *Stage-discharge relations, *Ice cover, Ice, Discharge coefficient, Gages, Discharge(Water), Channel morphology, Discharge measurement, Water measurement, Hydrologic data, International hydrological decade.
Identifiers: *Hungary.

On watercourses where the ice cover is formed within a brief period of time, the ratio of streamflow with and without ice cover can be constructed on the basis of a sufficient number of streamflow measurements under ice. The curves thus obtained show appreciable differences, depending on the size and shape of the cross-sections. The family of curves determined from measurements can be used under the climatic and hydrological conditions prevailing in Hungary for constructing the relationship between the flow under ice and stage, if a single streamflow value measured under ice is available and the hydrology of the cross-section under consideration is well known. The coefficient allowing for the geometry and hydrological conditions of the cross-section offers the possibility, under similar circumstances, for determining this relationship even without streamflow measurement under ice and for including the effects of changes in cross-section. HYDRAULIC MODEL STUDY TO DETERMINE A STAGE-DISCHARGE RELATIONSHIP,
Snowy Mountains Hydro-Electric Authority, Cooma (Australia).
S. K. Stephens, and H. L. Stark.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 412-422, 1973. 4 fig.

Descriptors: *Stage-discharge relations, *Floods, *Rivers, *Australia, *Hydraulic models, Water measurement, Discharge measurement, Flow measurement, Stream gages, International hydrological decade.
Identifiers: *Burdekin River(Australia).

A large part of the runoff in the Burdekin River at Burdekin Falls in Queensland, Australia, is derived from floodflows which can exceed two million cusecs. Because of the difficulty of gaging flows of this order by conventional means, the stage-discharge relationship was derived by a hydraulic model study. A model was constructed based on a photogrammetric survey of approximately 3 miles of the river to an undistorted scale of 1:100. Data necessary for model verification were provided from current meter gagings for relatively low flows of up to 16,000 cusecs and flood slopes at discharges of up to about 700,000 cusecs from observations at two stage-recorder sites. The model produced a stage-discharge relationship to an accuracy of about plus or minus 5% for flows up to 1,000,000 cusecs. (See also W74-11493) (Knapp-USGS)
W74-11531

THE INTENSE EVALUATION OF DISCHARGE MEASUREMENTS BY THE EQUATIONS OF THE UNIVERSAL VELOCITY DISTRIBUTION LAW,
Bayerischer Gewaesserkundedienst Staatlich Byaerische, Munich (West Germany).
W. Unbehauen.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 865-882, 1973. 6 fig, 2 tab, 22 ref.

Descriptors: *Discharge measurement, *Velocity, *Open channel flow, *Flow measurement, Discharge(Water), Current meters, Stream gages, Flow, Flow rates, Roughness(Hydraulic), Flow characteristics, International hydrological decade.

The assumptions made in obtaining the universal velocity distribution laws are valid also for natural channels. These findings are the basis for evaluation of discharge measurements by means of the velocity distribution laws. With the help of the wall law, the turbulent shear velocities v sub * and the effective roughness k may be computed. The value k represents the total hydraulic roughness produced by turbulent friction and further additional energy losses. The additional determination of the mean shear velocity of the cross-section will provide the initial data for the computation of the mean velocities of each vertical and the total cross-section. By means of the sectional area and the velocity, the total discharge of the cross-section is determined. This procedure for evaluation of discharge also permits the determination of the hydraulic parameters v sub * and k. (See also W74-11493) (Knapp-USGS)

HYDROLOGIC DATA FOR LITTLE POND CREEK AND NORTH ELM CREEK, BRAZOS RIVER BASIN, TEXAS, 1972,
Geological Survey, Austin, Tex.
R. N. Mitchell.
Open-file report, May 1974. 37 p, 2 fig, 2 tab.

Descriptors: *Basic data collections, *Rainfall-runoff relationships, *Small watersheds, *Texas, Data collections, Hydrologic data, Hydrographs, Discharge(Water), Water resources development.
Identifiers: Little Pond Creek(TX), North Elm Creek(TX), *Brazos River basin(TX).

Rainfall and runoff data collected during the 1972 water year are presented for the 22.2-square-mile area above the stream-gaging station Little Pond Creek at Burlington, Texas, and the 48.6-square-mile area above the stream-gaging station North Elm Creek near Cameron, Texas. Instruments to collect rainfall and runoff data in the study area consist of a network of rain gages and stream-gaging stations on Little Pond Creek and North Elm Creek. Data collection began in October 1962. Continuous water-stage records at the two stream-gaging stations, Little Pond Creek at Burlington and North Elm Creek near Cameron, together with measurements of streamflow, are used to compute total runoff from each area. Low-water concrete controls at each station were constructed to stablize the low-water portion of the stage-discharge relationship. (Knapp-USGS)
W74-11733

FLOOD PROFILES OF THE LOWER HILLSBOROUGH RIVER, FLORIDA,
Geological Survey, Tallahassee, Fla.
J. F. Turner, Jr.
Open-file report 74003, 1974. 29 p, 7 fig, 5 tab, 8 ref.

Descriptors: *Flood profiles, *Florida, Peak discharge, Flood data, Flood forecasting.
Identifiers: *Hillsborough River(FL).

Flood profiles are given for selected theoretical floods for a 10-mile reach of the lower Hillsborough River, Florida, including Tampa Reservoir. The procedures for making these flood profiles for controlled and uncontrolled flow conditions at Tampa Dam are based on flood heights computed in a step-backwater analysis. Resulting flood profiles can be used to delineate areal extent of flooding on topographic maps. This information can be utilized by governmental agencies to control flood-plain development in minimizing possible future flood losses. (Knapp-USGS)

LOW-FLOW CHARACTERISTICS OF SELECTED STREAMS IN THE SABINE RIVER BASIN DOWNSTREAM FROM TOLEDO BEND RESERVOIR,
Geological Survey, Baton Rouge, La.
M. J. Forbes, Jr.
Sabine River Compact Administration Publication, 1974. 9 fig, 1 plate, 2 tab, 9 ref, 2 append.

Descriptors: *Low flow, *Base flow, *Rivers, *Texas, Water yield, Duration curves, Reservoirs, Surface-groundwater relationships.
Identifiers: *Sabine River(TX).

Substantial amounts of groundwater enter stream channels of the Sabine River basin downstream from Toledo Bend Reservoir, Texas-Louisiana. This part of the basin, comprising about 20% of the total area drained by the Sabine River, contributed about 72% of the flow occurring at the gaging station near Ruliff, Tex., during a low-flow investigation in 1963. Aquifers contributing to flows in streams in this part of the basin are the Jasper, Evangeline, and Chicot. The 7-day 2- and 10-year low-flow frequency values for the Sabine River near Ruliff, Tex., are 670 and 340 cubic feet per second, respectively. Flow rates equaled or exceeded 90% of the time at the Sabine River gaging stations near Bon Wier and Ruliff, Tex., are about 290 and 600 cfs, respectively, with assumed zero release from Toledo Bend Reservoir. Low-flow frequency and flow-duration values for gaged and ungaged tributaries to the Sabine River are also presented. Prediction of low flows in the main channel of the Sabine River could be improved by more accurate determination of reservoir outflow and the establishment of a low-flow model for the main channel. (Knapp-USGS)

FLOODS OF JANUARY 1974 IN WASHINGTON,
Geological Survey, Tacoma, Wash.
R. J. Longfield.
Open-File report, 1974. 13 p, 3 fig, 2 tab, 1 ref.

Descriptors: *Floods, *Washington, *Historic flood, *Snowmelt, Rainfall, Peak discharge, *Flood data, Data collections.

Record floods occurred in parts of Washington during January 14-21, 1974. The floods resulted from runoff from warm, moderately heavy rain that continued most of the week, augmented by runoff from the rapid melting of near-record snowpack that extended to low elevations. New-record peak flows occurred at many gaging stations which have been operated continuously for 20 to 50 years and at one which has been operated since 1907. At lease two deaths were attributable to the floods, and property damage in the four hardest hit counties were estimated to be $21 million. (Knapp-USGS)

STREAMFLOW, SEDIMENT, AND TURBIDITY IN THE MAD RIVER BASIN, HUMBOLDT AND TRINITY COUNTIES, CALIFORNIA,
Geology Survey, Menlo Park, Calif.
W. M. Brown, III.
Water-Resources Investigations 36-73, December 1973. 57 p, 21 fig, 7 tab, 42 ref.

Descriptors: *Data collections, *Hydrologic data, *California, *Sedimentation, *Streamflow, Erosion, Sediment transport, Silting, Reservoir silting, Turbidity, Runoff.
Identifiers: Mad River Basin(Calif).

The Mad River discharged an average suspended-sediment load of 2,710,000 tons per year during a 13-year period beginning October 1957. Preliminary analysis of data collected during the 1971 water year indicated that about 66% of the suspended sediment was derived from sources upstream from a proposed reservoir site on the Mad River near Butler Valley. The high rate of suspended-sediment discharge and the corresponding sediment-induced turbidity of the streamflow and constitute potential problems in the operation of the proposed reservoir. C. P. Jelesnianski.
Available from NTIS, Springfield, Va. 22161 as NWS TDL-46 Price $3.00 printed copy; $2.25 microfiche. Technical Memorandum NWS TDL-46, April 1972. 52 p, 19 fig, 4 tab, 14 ref, 3 append.

Descriptors: *Surges, *Tides, *Computer programs, *Wind tides, Storms, Winds, Waves(Water), Hurricanes, Storm surge.

A computer program estimates the height of potential storm surges. Two separate methods are based on dynamics. The first method, in which precomputed nomograms are used, is designed only to arrive at a peak surge value. In the second method, a dynamic model is used to compute surges along an entire coastline. Surface meteorological parameters are used as input to the operational program. (Knapp-USGS)

EASTERN INTENSIFICATION OF OCEAN SPIN-DOWN: APPLICATION TO EL NINO,
Scripps Institution of Oceanography, La Jolla, Calif.
W. B. White, and J. P. McCreary.
Journal of Physical Oceanography, Vol 4, No 3, p 295-303, July 1974. 4 fig, 8 ref. Naval Research Contract N000-14-69-A-0200-6043.

Descriptors: *Ocean currents, *Ocean circulation, *Mathematical models, Oceanography, Oceans, Pacific Ocean, Tropical regions, Model studies, Analytical techniques, Numerical analysis.
Identifiers: *El Nino, *Ocean spin-down, Humboldt current, Peru oceanic current, Peru coastal current, South Pacific, Eastern tropical.

This study has direct application to El Nino. The general decrease in equatorward transport of the Humboldt Current off the coast of Peru allowed for the anomalous increase in temperature by reducing the advection of cold subtropical waters. The asymmetric intensification of eastern boundary spin-down had the effect of lowering the dynamic height of the sea surface in the eastern equatorial region. This situation was conducive for the cross-equatorial transport of warm water to the south. The advection of warm interior water to the east did not seem to be allowed by the spin-down process and therefore was not considered as a source of warm El Nino waters. A mathematical model of large-scale ocean spin-down, induced by a reduction in the mean strength of the large-scale wind systems showed that spin-down of the interior ocean was intensified along the eastern boundary with de-intensification propagating in time toward the west and extending out to 1000 km after one year. The interior portions of the ocean circulation were only weakly affected. The spin-down was asymmetric, with greater de-intensification in the equatorial eastern boundary than in the poleward regions, making it appear as though the Humboldt Current was directed off-shore just south of Peru. This asymmetric aspect of gyre spin-down can be explained in terms of nondispersive Rossby waves propagating energy to the west at a faster rate near the equator than near the poles. (Humphreys-ISWS)

FLOOD CHARACTERISTICS OF OKLAHOMA STREAMS,
Geological Survey, Oklahoma City, Okla.
V. B. Sauer.
Water Resources Investigation 52-73, January 1974. 303 p, 21 fig, 4 tab, 5 ref, 2 append.

Descriptors: *Floods, *Oklahoma, Flood recurrence interval, Peak discharge, *Flood frequency, *Flood data, Regression analysis.

Floods of 2-, 5-, 10-, 25-, 50-, and 100-year recurrence intervals were related to basin and climatic parameters for natural streams in Oklahoma by multiple regression techniques. One equation for each recurrence interval applies statewide for all natural streams except where manmade works, such as dams, flood-detention structures, levees, channelization, and urban development appreciably affect flood runoff. The equations can be used to estimate flood frequency of a stream at an ungaged site if drainage area size, main channel slope, and mean annual precipitation are known. At or near gaged sites, a weighted average of the regression results and the gaging station data is recommended. Individual relations of flood magnitude to contributing drainage area are given for all or parts of the main stems of the Arkansas, Salt Fork Arkansas, Cimarron, North Canadian, Canadian, Washita, North Fork Red, and Red Rivers. About two-thirds of all annual floods in Oklahoma occur during April through July. Less than one-half of one percent of annual floods occur in December. Flood records at all gaging sites in Oklahoma and some selected sites in adjacent States are presented. (Knapp-USGS)

INVESTIGATION OF DIFFUSION IN OPEN-CHANNEL FLOWS,
Geological Survey, Bay Saint Louis, Miss.
T. N. Keefer, and R. S. McQuivey.
Journal of Research of the U.S. Geological Survey, Vol 2, No 4, p 501-509, July-August 1974. 8 fig, 4 tab, 9 ref.

Descriptors: *Dispersion, *Open channel flow, *Turbulent flow, Statistical methods, Mixing, Path of pollutants, Diffusion.

The interrelation between turbulent diffusion, dispersion, and the statistical properties of turbulence in an open-channel flow was studied. The results of the study substantiate Philip's concept relating the ratio of Eulerian to estimated Lagrangian time scales and the reciprocal of the longitudinal intensity of turbulence. The relation may be used to predict coefficients of longitudinal turbulent diffusion at the water surface and in the flow field. A similar concept using an integral scale based on the longitudinal intensity of turbulence may be used to predict coefficients of both surface and depth-averaged turbulent diffusion in three coordinate directions. Longitudinal space-time velocity correlation measurements can be used to predict the Lagrangian time scale only under limited conditions. Within the range of conditions studied, longitudinal diffusion accounted for 4% to 13% of the one-dimensional dispersion process. (Knapp-USGS)
W74-11972

COON RAPIDS POOL HYDROGRAPHIC STUDY,
Geological Survey, Saint Paul, Minn.
J. K. Hicks.
Open-file report, July 1974. 6 p.

Descriptors: *Mississippi River, *Minnesota, *Hydrography, Profiles, Water levels, Reservoirs, Stage-discharge relations, Discharge(Water).
Identifiers: Coon Rapids(MN).

During periods of regulation the Coon Rapids Pool of the Mississippi River in Minnesota extends upstream from the dam approximately to U.S. Highway 52 bridge connecting Anoka and Champlin. The operating procedure is to close the gates at the dam and fill the pool about May 1 each year. During the months of May through October the gates are automatically operated to maintain the water surface at the dam at an elevation of 830.0 ft above mean sea level. About November 1, the gates are opened, draining the pool and permitting unrestricted flow through the pool area. Median monthly summer flow is 6,500 cfs. An average monthly flow of 15,000 cfs is exceeded only in a small, gradually decreasing percentage of time, from a high of 35% in May to a low of 1% in September. Water-surface elevations and depth of water at cross sections are given. (Knapp-USGS)

GROUNDWATER OCCURRENCE AND MOVEMENT IN THE ATHOL AREA AND THE NORTHERN RATHDRUM PRAIRIE, NORTHERN IDAHO,
Geological Survey, Boise, Idaho.
R. E. Hammond.
Available from the Idaho Dept. of Water Admin, Statehouse-Annex 2, Boise, Idaho 83707, Price $.50. Idaho Department of Water Administration, Boise, Water Information Bulletin No 35, March 1974. 19 p, 8 fig, 12 ref.

Descriptors: *Groundwater movement, *Idaho, *Hydrogeology, *Alluvial channels, Alluvium, Water levels, Transmissivity, Water yield.
Identifiers: *Rathdrum Prairie(ID).

A highly permeable aquifer occupying a buried channel (ancestral Rathdrum River) underlies the Spokane Valley of northeastern Washington and the Rathdrum Prairie and Athol areas of northern Idaho. Large quantities of water are pumped from the aquifer for irrigation, industrial, and municipal use. Natural discharge from the aquifer to the Spokane River is used for power generation. Data were collected by geophysical survey (gravity), test drilling, and mass measurements of water levels in wells. Groundwater in the aquifer moves from the Athol area to the northern Rathdrum Prairie through only two of three buried channels. About 200 million gallons per day is estimated to flow through the two buried channels--the west channel and the Chilco channel. Of this amount, about 170 million gallons per day flows through the west channel and 30 million gallons per day through the Chilco channel. Flow through the middle channel is considered negligible because the bedrock bottom of the channel is above the water table. The west channel is filled at least partly with large, loose boulders. The Chilco channel is both smaller in cross-section than the west channel and is filled with less permeable material. Use of groundwater to date has had negligible effects on water levels in the study area. (Knapp-USGS)

HYDROLOGIC DATA FOR URBAN STUDIES IN THE FORT WORTH, TEXAS, METROPOLITAN AREA, 1972,
Geological Survey, Austin, Tex.
B. B. Hampton.
Open-file report, June 1974. 123 p, 3 fig, 5 tab.

Descriptors: *Urban hydrology, *Texas, *Rainfall-runoff relationships, *Basic data collections, Hydrologic data, Data collections, Cities, Storm runoff, Urbanization.
Identifiers: *Fort Worth(TX).

Hydrologic investigations on several small streams in Forth Worth, Texas are designed to evaluate factors affecting floods on small streams in the metropolitan area. The objectives of the program are to determine, on the basis of historical data and hydrologic analyses, the magnitude and frequency of floods; to document and define the areal extent of floods of greater than ordinary magnitude; and to determine the effect of urban development on flood peaks and volume. The four study areas within the metropolitan area are Sycamore Creek, Sycamore Creek tributary, Dry Branch, and Little Fossil Creek. The Sycamore Creek tributary study area includes the highly impervious area of the Seminary South Shopping Center as a subarea. Summaries of storm rainfall-runoff data for selected individual storms at streamflow stations and crest-stage partial-record stations are given in tables. Detailed storm rainfall and runoff records, hydrographs, and mass curves are compiled for each station. (Knapp-USGS)

DIGITAL MODEL OF THE OGALLALA AQUIFER OF THE NORTHERN PART OF THE NORTHERN HIGH PLAINS OF COLORADO,
Geological Survey, Denver, Colo.
R. R. Luckey, and W. E. Hofstra.
Colorado Water Resources Circular No 24, 1974. 22 p, 12 fig, 10 ref.

Descriptors: *Mathematical models, *Aquifers, *Colorado, *Great Plains, Finite element analysis, Hydrogeology, Water levels, Water table, Withdrawal, Forecasting, Simulation analysis, *Computer models.
Identifiers: *Ogallala aquifer(CO).

A finite-difference technique was used to model the hydrology of the Ogallala aquifer under 1,400 square miles in the northern part of the northern High Plains of Colorado. The model was verified by comparing observed and calculated changes in water levels for the period 1964-71. The model was used to predict changes in water levels for the period 1964-2000. Under the assumption that there would be no groundwater development after 1970, water-level declines of from less than 10 feet to over 50 feet were predicted. Under the assumption that 610 new wells would be added during the period 1971-80, water-level declines of from less than 10 feet to over 120 feet were predicted. The model was sensitive to pumpage and specific yield but was insensitive to hydraulic conductivity. To further refine the model, pumpage and specific yield must be more accurately determined. THE USES OF GEOPHYSICAL METHODS IN HYDROGEOLOGICAL INVESTIGATIONS IN ISRAEL,
Geological Survey of Israel, Jerusalem.
A. Issar, and A. Levanon.
Hydrological Sciences Bulletin, Vol 19, No 2, p 199-217, June 1974. 10 fig 1 tab, 10 ref.

Descriptors: *Hydrogeology, *Geophysics, *Geological surveys, *Aquifers, Groundwater geology, Geologic mapping, Groundwater, Geology, Hydrology, Subsurface mapping, Electrical studies, Exploration, Resistivity, Geologic formations, Water sources, Geologic investigations, Coastal plains, Mountains.
Identifiers: *Israel.

The most important contribution of geophysics to hydrogeological investigations in Israel is in the construction of the structural map of the top of the limestone and dolomite aquifers in the foothills region. This work was undertaken mainly by electrical resistivity methods aided by data from a few wells and gravimetric data. The knowledge gained from this investigation helped in the location of other deep wells as well as in the preparation of water development and supply plans. Important assistance was also obtained from electrical resistivity methods in the location of alluvial aquifers in the Arava valley in southern Israel as well as in the location of down-faulted limestone and dolomite blocks in the same region. Geophysics, especially the induced resistivity methods are among the most important tools in hydrogeological research. The greatest benefit is obtained from these methods when they are incorporated in a general hydrogeological investigation. The stage by stage intesification of the research followed by exploration and exploitation drilling enables progressive application of geophysical methods when each stage, based on data obtained from the prior stage, was examined and verified. 2G. Water In Soils

EFFECT OF SURFACE WETTABILITY ON CAPILLARY MOVEMENT OF WATER IN SOIL (VLIYANIYE SMACHIVAYEMOSTI POVERKHNOSTI NA KAPILLYARNOYE PEREDVIZHENIYE VLAGI V POCHVE),
Akademiya Nauk SSSR, Moscow. Pochvenny Institut.
V. V. Rybina.
Pochvovedeniye, No 9, p 137-141, September 1973. 4 tab, 14 ref.

Descriptors: *Wettability, *Surfaces, *Soil water movement, *Capillary action, *Capillary water, Bound water, Soil aggregates, Humus, Sands, Quartz, Pores.
Identifiers: USSR.

A relation between rate of capillary movement and wettability of pore walls was demonstrated by experiments. Treatment of a surface of quartz sand with humic substances decreases wettability and, consequently, reduces the rate of movement of capillary water. Different layers of adsorbed water were found to have a different wettability. The wettability of a material increases with the amount of loosely bound water. Assumptions regarding the mechanism of movement of capillary water in a soil pore were based on data obtained. Wettability of sand as a function of moisture content, rate of capillary rise of water in sands of different moisture content, and depth of the meniscus of a moving column of capillary water are tabulated. AIR AND WATER FLOW DURING PONDED INFILTRATION IN A VERTICAL BOUNDED COLUMN OF SOIL,
Universite Scientifique et Medicale de Grenoble (France). Institut de Mecanique.
G. Vachaud, J. P. Gaudet, and V. Kuraz.
Journal of Hydrology, Vol 22, No 1/2, p 89-108, June 1974. 10 fig, 3 tab, 18 ref.

Descriptors: *Infiltration, *Ponding, *Unsaturated flow, *Soil water movement, Porous media, Permeability, Percolation, Induced filtration, Groundwater movement, Hydraulic conductivity, Soils, Fine aggregates, Sands, Compressible flow.

In order to study the effects of air movement and compressibility during ponded infiltration, experiments were conducted on a soil column of fine sand both with and without provision for air flow through the walls. Continuous measurements of water content changes, water pressure changes and air pressure changes at different levels were taken and analysed in order to obtain the capillary pressure and the relative permeability curves for each phase. These measurements have shown that if air cannot escape freely through the walls, there is a considerable reduction in the infiltration rate, the shape of the water profiles is significantly different, and the air pressure gradients are not negligible. A NOTE ON THE RELATIONSHIP BETWEEN SIZE OF AREA AND SOIL MOISTURE VARIABILITY,
South Pacific Regional Coll. of Tropical Agriculture, Alafua (Western Samoa).
S. G. Reynolds.
Journal of Hydrology, Vol 22, No 1/2, p 71-76, June 1974. 1 fig, 2 tab, 13 ref, 1 append.

Descriptors: *Soil moisture, *Variability, *Soil surveys, *Statistics, Moisture content, Soil surface, Sampling, Data collection, Quality control, Areal, Size.

The influence of size of area on soil moisture variability in the surface 5 to 8 cm of soil is examined using thirteen plot sizes ranging from 1 sq m to 6 million sq m. The gravimetric weight basis method of moisture measurement is employed. Although size of area and moisture variability are shown to be closely related with an r squared value of 0.70, in practical terms variability is probably best considered in terms of three broad areal classes (1 to 1,000 sq m, 1,000 to 100,000 sq m and 100,000 to approx. 10 million sq m) each of which has representative values for coefficient of variation and required sample size. Descriptors: *Plant physiology, Chlorophyll, Soil moisture.
Identifiers: Chlorophyllase, Mentha piperita, Nepeta transcaucasica.

The effects of various water regimes on yield and quality of Nepeta trancaucasica Grossh., and on the pigment complex of the photosynthetic apparatus were studied. 'Free' and 'bound' water was determined in irrigated and nonirrigated crops by the Gusev method. Content of chlorophylls 'a' and 'b' and carotenoids were determined photometrically, chlorophyllase, by chromatograph, and ethereal oils by an extraction method. Scatter analysis of data was used. Yield of green mass and ethereal oil content of N. transcaucasica were compared with those of Mentha piperita L. in 1969, 1970 and 1971. In both species, yield of green mass was 1.5-2 times higher under irrigated conditions; ethereal oil content tended to be lower. In irrigated specimens of N. transcaucasica Grossh., 'free' water content in leaves increased, while 'bound' water decreased; permeability of cells generally decreased; chlorophyll 'a', 'b', and carotenoids increased, with maximum pigment content in the flowering phase; lability of chlorophyll 'a' increased in comparison to that of chlorophyll 'b'. When soil moisture was continuously high, pigment content decreased in the second yr. This biphasic response indicates adaptation during the second yr.--Copyright 1974, Biological Abstracts, Inc.

Descriptors: *Soil moisture, Permeability, Filters, Sounding.
Identifiers: Gardner method, Richard method.

Two nonstationary sound methods for determining the permeability coefficient of soil moisture are compared. Porous ceramic filters were put on their axes, and upon creating rarefaction inside, the water flowed from the soil into the filters. From the rate of flow, the coefficients of the permeability of soil moisture were determined at various pressures. In the method of Gardner, hydraulic resistance of the filter and the soil sample is not considered. Thus, results obtained by this method exceed the data obtained by the Richards method.--Copyright 1974, Biological Abstracts, Inc.

Identifiers: *Brookston soils, *Crosby soils, Dover(Indiana).

Hydraulic conductivity and seasonal patterns of water content were measured and related to soil formation in associated very poorly drained Brookston soils (Typic Argiaquolls) and somewhat poorly drained Crosby soils (Aeric Ochraqualfs) in central Indiana. In the Brookston soil the water table was near the surface for only a short time during periods of heavy rainfall in the winter and spring. The water table then stabilized near 125 cm deep, where it was controlled by tile drains. In Crosby, also tile-drained, the water table stayed near the surface longer in the spring, then became deeper than in Brookston. The hydraulic conductivity is relatively high in the Brookston B and C and Crosby B horizons but very low in the Crosby C horizon, compact glacial till. Since downward movement is restricted in the Crosby C horizon, water tends to move laterally through the B horizon into the Brookston soil where the tile are

in more permeable horizons than they are in Crosby. Available water capacities of soils can be estimated by measuring the field water contents in a profile at the beginning of the growing season and during dry periods for several years using a soil under perennial vegetation. In these two soils, however, it appears that water movement from Crosby to Brookston and the profile storage capacity are both important in determining the water-supplying capacity of the soils. A MODIFIED HORTON EQUATION FOR INFILTRATION DURING INTERMITTENT RAINFALL,
University of the Witwatersrand, Johannesburg (South Africa). Hydrological Research Unit.
S. W. Bauer.
Hydrological Sciences Bulletin, Vol 19, No 2, p 219-225, June 1974. 4 fig, 12 ref.

Descriptors: *Infiltration, *Percolation, *Hortons law, Hydrologic budget, Soil water movement, Infiltration rates, Rainfall-runoff relationships, Retention, Soil moisture, Storage capacity, Unsaturated flow, Hydrology, Hydrographs, Soil water, Groundwater, Percolating water.

A simple infiltration concept based on Horton's infiltration equation was developed for use in mathematical rainfall-runoff modeling. Horton's infiltration formula is valid only where rainfall intensity at all times exceeds infiltration and, moreover, it does not provide adequately for the handling of a variety of initial soil moisture conditions. In contrast to Horton's concept where infiltration rate is expressed as a decay function of time, a procedure is advocated that expresses the infiltration rate as a function of soil moisture storage state. The procedure permits infiltration losses during intermittent rainfall sequences to be evaluated and accommodates a range of initial soil moisture conditions. (Humphreys-ISWS)

PRODUCTION OF ZOOPLANKTON POPULATIONS IN FRESH WATERS OF THE USSR, (IN RUSSIAN),
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Institut.
M. B. Ivanova.
Ekologiya. Vol 4, No 3, p 52-62, 1973. Illus.

Descriptors: *Zooplankton, Primary productivity, Lakes, Reservoirs, Ponds.

A critical review of studies on the calculation of the production of zooplankton in lakes, reservoirs and ponds is presented. As the index of the rate of production of different species under conditions of different biotopes it is recommended that the relation P/B (the ratio of production during a known period of time to the average biomass during this same time), which depends on temperature, food supply, and age composition of the population, be used. Most often P/B is calculated for a month, vegetative period or year, which is warranted when the production of different trophic levels in the same body of water or the production capabilities of different bodies of water is compared. When determining the dependence of the rate of production on ecological factors or comparing the increment of 1 spp. in different bodies of water is required, the daily P/B should be used.--Copyright 1974, Biological Abstracts, Inc.

A. O. Lind.
Available from NTIS, Springfield, Va. 22161 as N73-27281 Price $3.00 printed copy; $2.25 microfiche. Remote Sensing Laboratory Contract Report for NASA, July 1973. 3 p, 1 fig. NASA Contract 5-21753.

Descriptors: *Remote sensing, *Satellites(Artificial), *Lake ice, *Ice cover, Mapping, Data collections, Freezing.
Identifiers: *ERTS, *Lake Champlain.

One usable ERTS-1 scene was available for lake ice survey of Lake Champlain. The January 8, 1973, coverage (Image No. 1169-11521) revealed various ice tones, patterns, and arrangements as well as open water. MSS band 5 imagery provided the most useful data. While it was not possible to differentiate open water from 1-to 2-day old ice, it was possible to interpret the tonal signatures of the frozen portion in terms of freezing history or age. The dark gray tones of new, smooth, ice contrasts with the medium gray tones of older ice, and the rough texture of wind-jammed bay ice. Mapping of these ice patterns is quite feasible with moderate enlargment of the scene (2 to 3X). (Knapp-USGS)

Descriptors: *Ponds, Plant populations.
Identifiers: *Carex bohemica, *Volga River(USSR), *USSR(Oka River).

Observations of C. bohemica (14) in the area drained by the Volga and Oka Rivers, USSR, from 1883 to the present are reviewed. Two recent new records are included: in a refuse area near a sawmill in the Kasimovskii Raion, Ryazanskaya Oblast and in the shallows of the Rybinsk Reservoir, Nekouzskii Raion, Yaroslovskaya Oblast. One patch was found in the former area, about 100 in the latter. Contrary to theories on the gradual disappearance of the plant, there is reason to expect new discoveries of the species in other regions of the Middle Volga basin, in particular in the Ivanovskaya and Vladimirskaya Oblasts. Recent dry seasons have led to substantial

decreases in the water level and the development of small ponds and shallow areas conducive to the spread of C. bohemica.--Copyright 1974, Biological Abstracts, Inc.

ON THE DYNAMICS OF WIND-DRIVEN LAKE CURRENTS,
International Field Year for the Great Lakes Project Office, Rockville, Md.
J. R. Bennett.
Journal of Physical Oceanography, Vol 4, No 3, p 400-414, July 1974. 13 fig, 44 ref. NSF Grant GA-33140.

Descriptors: *Lake Ontario, *Currents(Water), *Mathematical models, *Wind tides, Analytical techniques, Continuity equation, Water circulation, Theoretical analysis, Topography, Shape, Summer, Density stratification, Lakes, Upwelling, Circulation, Unsteady flow, Great Lakes, Limnology.
Identifiers: *Wind-driven currents, *Geostrophic, Linear model, Numerical model, Transient theory, Two-dimensional.

Two time-dependent 'vertical cross section models' were analyzed and applied to wind-driven currents in Lake Ontario. The models were a linear frictionless, two-level model, and a numerical model which included both friction and nonlinear terms. They predict current and temperature under the assumption that all variables except pressure are independent of the longshore coordinate. The longshore pressure gradient was computed from the condition that the volume transport normal to the cross section is zero. The quasi-static response of the linear frictionless model was studied to isolate the effects of topography and stratification on the structure of the coastal currents. It predicted that the vertically averaged longshore current was independent of both rotation and stratification. Under homogenous conditions, the strongest current was confined to a thin region near the shore. Stratification increased the width of this 'coastal jet region' and caused the flow to be more confined to the surface layer. The qualitative results of the linear model were also true for the numerical model, but the latter gave more realistic current magnitudes. The main differences between the two models were due to friction which had a relatively straight-forward damping effect on both the quasi-geostrophic and inertial oscillation components of the flow. The damping of the geostrophic mode was smaller in cases where stratification was important, because it decreased the effect of bottom friction. The models can explain many of the differences between the spring and summer regimes. (Humphreys-ISWS)
W74-11895

SOME CHARACTERISTICS OF NEARSHORE CURRENTS ALONG THE NORTH SHORE OF LAKE ONTARIO,
Canada Centre for Inland Waters, Burlington (Ontario).
J. O. Blanton.
Journal of Physical Oceanography, Vol 4, No 3, p 415-425, July 1974. 6 fig, 2 tab, 16 ref.

Descriptors: *Lake Ontario, *Lake Shores, *Currents(Water), Lakes, Great Lakes, Limnology, Seasonal, Spring, Summer, Autumn, Flow, Synoptic analysis, Statistics, Data processing, Winds, Thermocline, Stratification, Topography, Isotherms, *Canada.
Identifiers: Oshawa(Canada).

In three periods during 1970 representative of spring, summer and fall, the horizontal currents off Oshawa in Lake Ontario were measured at distances of 3, 6, 11, and 16 km offshore. All records were spectrally analyzed for an equal number of 2 hr values within each period. Within each season, there was a tendency for the total variance to decrease with depth and with distance offshore. Total energy at any given distance offshore was lowest in spring and highest in fall. At distances between 6 and 11 km offshore in the summer period, there was an abrupt increase offshore in the percent of total variance contained in rotary-type motion near the theoretical inertial period. The offshore increase in other seasons was much smaller in magnitude. For all seasons, flow was predominantly westward. Nearshore currents reversed from west to east flow about 6 hr after the wind changed, but farther offshore the reversal lagged the wind by about 12 hr in summer and 36 hr in fall. These observations supplemented by data of the thermal structure of Lake Ontario indicate an apparent surplus of westerly momentum in the nearshore zone of Lake Ontario's north shore. It was concluded that single-point measurements of current flow in the near-shore zone are poor indicators of the flow structure surrounding the point. (Humphreys-ISWS)

ON WIND-DRIVEN LAKE CIRCULATION,
Michigan Univ., Ann Arbor. Dept. of Atmospheric and Oceanic Science; and Michigan Univ., Ann Arbor. Dept. of Applied Mechanics and Engineering Science.
S. J. Jacobs.
Journal of Physical Oceanography, Vol 4, No 3, p 392-399, July 1974. 4 fig, 1 tab, 6 ref. NSF Grant GA-23016.

Descriptors: *Water circulation, *Lakes, *Currents(Water), *Mathematical models, Winds, Movement, Hydraulics, Great Lakes, Analytical techniques, Equations, Laplaces equation, Momentum.
Identifiers: Wind-driven, Ekman number, Rossby number.

The flow induced by applying a wind stress at the surface of an initially quiescent lake was considered. It was assumed that the Ekman number, based on an eddy viscosity, is small, and that the Rossby number was at most of the order of the square root of the Ekman number. Under these conditions, which are met in practice, a linear theory is applicable. The linear problem was solved using boundary layer methods. There are essentially five distinct regions: an outer region in which the horizontal velocity is independent of depth, Ekman layers at the upper and lower boundaries, a corner region at the edge of the lake at which the Ekman layers meet, and a shear layer adjacent to the corner region. Study of the Ekman layers provided the equations which hold in the outer and shear layer regions, and consideration of the corner region provided the boundary condition. The outer flow proved to be geostrophic and directed along curves of constant depth. The shear layer is needed to satisfy the boundary condition of zero net outward transport at the edge of the lake. If the wind stress is constant, or, more generally, has zero line integral around curves of constant depth, the transport is confined to the shear layer. (Humphreys-ISWS)

Identifiers: *International Field Year on the Great Lakes, Oshawa(Canada), Dynamical analysis, Geostrophic balance.

A dynamical analysis was presented of some observations made during the International Field Year on the Great Lakes (IFYGL) on the north shore of Lake Ontario at Oshawa. The data analysed relate to water movements during the spring thermal regime, when a warm water band at the shores surrounds a cold central lake mass. Two periods were discussed in detail which demonstrate the influence of wind-stress-impulses in generating respectively westward flow associated with a wedge-shaped spring thermocline, and eastward flow with a lens-shaped thermocline. The day to day changes in depth-integrated momentum transport in the shore zone showed most clearly the direct effects of storms. Important modifying influences were bottom friction and momentum advection by onshore-offshore water movements. The way in which the momentum was partitioned between the surface (warm) water and the underlying water mass illustrates an important effect of the Coriolis force, which effectively transfers momentum downward. Earth rotation effects were also responsible for inertial oscillations of the interface between cold and warm waters. On some occasions this interface was maintained in an inclined position by geostrophic balance between the pressure gradient and the Coriolis force. Thus, the important physical factors in spring thermocline mechanics were wind stress, stratification and Coriolis force, complicated by some more or less obvious effects of bottom friction and momentum advection. 2I. Water In Plants

EFFECT OF CHLOROMEQUAT CHLORIDE (CCC) ON GROWTH, YIELD AND FIBRE PROPERTIES OF COTTON PLANTS GROWN UNDER VARIOUS CONDITIONS OF SOIL MOISTURE,
National Research Centre, Cairo (Egypt). Botany Lab.
M. T. El-Saidi.
Z Acker- Pflanzenbau. Vol 137, No 1, p 35-45, 1973. Illus.

Descriptors: *Cotton, Plant physiology, Fibers(Plant), Soil moisture.
Identifiers: Chloromequat chloride.

Cotton plants Gossypium barbadense (cv. 'Giza 69') were grown under different conditions of water supply in ontogenesis. Plants were exposed to water deficit at budding or at beginning of flowering or at maximum of flowering. At the time of shortage of water supply, cotton plants were sprayed with 150 mg/l of CCC. The CCC solution was applied at fine mist run off covering all aerial parts of cotton plants, without dropping any solution on the soil. CCC decreased the daily growth of the main stem of cotton plants grown under normal conditions of water supply. Water deficit and CCC treatments at budding stage delayed the flowering date about 2.6, and 1.6 days, respectively, than control. At the same time the date of first boll opening was earlier than control with about 3.3 days in case of drought, and 2.4 days with CCC treatment. Spraying cotton plants grown under drought conditions at budding with CCC gave a higher yield in comparison with the dry treatment

which was sprayed with water only. A slight reduction in lint percentage and average weight of 1000 seeds was observed in treatments sprayed with CCC. Fiber length was also affected by water deficit and CCC treatments. The lower value of fiber length was observed in the treatment with water deficit and sprayed with CCC.--Copyright 1974, Biological Abstracts, Inc.

SOME REGULATORY MECHANISMS OF COTTON ADAPTATION TO DROUGHT AND A SURPLUS WATER SUPPLY, (IN RUSSIAN),
Tashkent Agricultural Inst. (USSR).
A. R. Rakhimov.
Dokl Vses Ord Lenina Akad S-Kh Nauk Im V I Lenina. 3, p 12-14, 1973.

Descriptors: *Cotton, Soil moisture, Drought.

Various species and types of cotton were used in a study of some regulatory mechanisms of adaptation to a drought and anaerobic conditions of the soil. Under the influence of drought, a disruption in the intensity and direction of physiolo-biochemical processes of metabolism occurs in the cotton. By means of regulatory mechanisms of adaptation, the vegetative cells adjust to self-regulation, which to some extent promote the return of the disrupted processes to normal.--Copyright 1974, Biological Abstracts, Inc.

STATISTICAL PARAMETERS OF DISTRIBUTION OF GRANULATION INDICATING SUSPENDED SEDIMENT AND BED SEDIMENT,
Technische Universitaet, Dresden (East Germany). Dept. of Hydrology and Meteorology.
N. Hansel.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 538-543, 1973. 1 fig, 1 tab, 4 ref.

Descriptors: *Particle size, *Statistical methods, *Bed load, *Suspended load, Sedimentology, Statistics, Sediment sorting, Data processing, Data collections, International hydrological decade.

Grain diameters must be based on proper statistics to characterize the distribution of granulation of sediments. Based on the typical form of the distribution of granulation, statistical parameters are presented, and their values for typical granulation mixtures are given. The distribution of grain number and grain surface can be derived from the usual distribution of granulation. The degree of fineness and the degree of uniformity are derived from Kneschke and Schoch's formula. (See also W74-11493) (Knapp-USGS)

In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 552-561, 1973. 7 fig, 2 tab, 5 ref.

Descriptors: *Tracers, *Sediment transport, *Fluorescent dyes, Bed load, Sands, Sampling, Data collections, Sedimentology, Sedimentation, Tracking techniques, International hydrological decade.

Particles of various diameters and specific gravities, coated with fluorescent dyes, were used to study sediment movement in sand-channel streams of the south-western United States. Simple and inexpensive techniques were developed for coating and injecting particles and for obtaining and analysing samples. The steady-dilution or time-integration methods are recommended for high velocity, flat bed conditions, while the spatial-integration method is more suitable for dune bed conditions. The transport rate, calculated by the time-integration method for a flat bed, was about 14 per cent greater than the measured transport rate. Particle velocities for the flat bed depended on size and density, whereas for the dune bed, particle velocities approximated to the dune migration velocity and appeared to be only weakly dependent on density. EROSION PROCESSES, FLUVIAL SEDIMENT TRANSPORT AND RESERVOIR SEDIMENTATION IN A PART OF THE NEWELL AND ZAYANTE CREEK BASINS, SANTA CRUZ COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
W. M. Brown, III.
Open-File report, August 3, 1973. 31 p, 14 fig, 4 tab, 19 ref.

Descriptors: *Sediment yield, *Reservoir silting, *Erosion, *Sedimentation, *California, Land use, Mass wasting, Road construction, Excavation, Landslides, Soil erosion, Vegetation effects.
Identifiers: Newell Creek basin(Calif), Zayante Creek basin(Calif).

Erosion and sedimentation were studied in the drainage basins upstream from Loch Lomond on Newell Creek and at a proposed reservoir site on Zayante Creek, California. The study area is underlain predominantly by sandstone, siltstone, and shale that decompose readily into moderately deep soils, friable colluvium, and easily transported sediments. Nearly all of the geologic units show a propensity for accelerated erosion accompanying the disturbance of the land surface by the road-building practices in the study area. At least 46 acre-feet of sediment accumulated in Loch Lomond in a 10-year period. Sediment yield was about 1,100 tons annually per square mile of drainage basin upstream from the reservoir arms where the major deposition occurred. This sediment occupied less than 1 percent of the original capacity of Loch Lomond, but the volume of measured sediment deposition is probably conservative. On Zayante Creek suspended-sediment yields were about 4,570 and 570 tons per square mile for the 1970 and 1971 water years. This probably reflects intensive roadbuilding practices in the central and upstream parts of the Zayante Creek drainage in the study area. (Knapp-USGS)

Available from NTIS, Springfield, Va 22161 as AD-774 902, Price $3.25 printed copy, $2.25 microfiche. Technical Report No 1, February 1, 1974. 38 p, 15 fig, 19 ref. ONR Contract No N00014-67-A-0158-0007.

Descriptors: *Estuaries, *Sedimentation, *Erosion, *Boating, *Waves(Water), *New Hampshire, Currents(Water), Sediment transport, Tides.
Identifiers: Boat waves, Boat wakes.

The effect of increased boat traffic on channel bank and tidal flat erosion was studied using a system of intake valves in a portion of a tidal flat in the Great Bay Estuary of New Hampshire. Waves were set up from six different boats, ranging in size from 13 to 34 feet. Water samples were collected from 8 stations spaced over the tidal flat. At each station, water samples at 30 and 15 cm off the bottom were collected before, during and after the boat wave passed by and were filtered for total suspended load. The boat wave characteristics were measured, along with the bottom currents, salinity, near bottom temperatures, and temperature profiles of the water column. Boat waves were set up at the beginning of the flood phase and near the end of the ebb. The boat waves can suspend 1/3 to 1/2 more sediments under the same wave conditions on the flood tide than on the ebb tide. During the flood tide the sediments were transported seaward in a tidal current gyre in the sampling area. Density underflows may form under severe wave activity and cause additional seaward transportation. (Knapp-USGS)

VARIATION IN BLUFF RECESSION IN RELATION TO LAKE LEVEL FLUCTUATIONS ALONG THE HIGH BLUFF ILLINOIS SHORE,
Lake Michigan Federation, Chicago, Ill.
C. E. Larsen.
Available from NTIS, Springfield, Va 22161 as PB-226 780, Price $3.75 printed copy; $2.25 microfiche. Illinois Institute for Environmental Quality Document No 73-14, September 25, 1973. 73 p, 16 fig, 6 tab, 26 ref.

Descriptors: *Erosion, *Beach erosion, *Lake Michigan, *Water level fluctuations, *Illinois, Surf, Waves(Water), Construction, Land use.

A theoretical method is given for approximating the accelerated erosion of the shoreline of a lake associated with high water levels. Given similar bluff height and composition, the retreat of the base of the bluff was expected to be in direct proportion to the water levels to which it is exposed. The high bluff portion of the Illinois shoreline of Lake Michigan is used to demonstrate this relationship. Definite variation from the influences of lake level fluctuation is evident. In each of three cases in which erosion differed from the expected amount, recession in proportion to lake level fluctuation occurred synchronously with the first documented construction activity along the shore. Construction was in the form of harbor structures, shore-sited buildings, and groins. (Knapp-USGS)

SUSPENDED-SEDIMENT LOAD OF TEXAS STREAMS, COMPILATION REPORT OCTOBER 1965-SEPTEMBER 1971,
Texas Water Development Board, Austin.
J. Mirabal.
Report 184, May 1974, 119 p, 1 fig.

Descriptors: *Sediment discharge, *Texas, *Data collections, *Suspended load, Sampling, Hydrologic data.

Suspended-sediment-load measurements made at permanent observation points in Texas from 1965 to 1971 are presented. During this period, the Texas Water Development Board operated 44 suspended-sediment sampling stations. A summary table shows maximum, minimum, and average annual suspended-sediment transport passing each gaging point for the total period. Sediment outflow records for four reservoirs in Texas were obtained. Records were taken at Possum Kingdom Reservoir, Brazos River basin; Somerville Lake, Brazos River basin; Lake Buchanan, Colorado River basin; and Lake Corpus Christi, Nueces River basin. (Knapp-USGS)

Gesellschaft fuer Strahlenforschung m.b.H., Munich (West Germany). Institut fuer Radiohydrometrie.
H. Moser, W. Stichler, and P. Trimborn.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 615-626, 1973. 6 fig, 2 tab, 12 ref.

Descriptors: *Deuterium, *Oxygen isotopes, *Surface waters, *Water balance, Alpine, Mountains, Precipitation(Atmospheric), Snowmelt, Rivers, Lakes, Hydrology, Data collections, International hydrological decade.
Identifiers: *Germany(Bavarian Prealps).

The hydrogen isotope ratio and the oxygen isotope ratio were studied in brooks, rivers and lakes in the Bavarian Prealps. The results are discussed with regard to the origin of the water and its intermixture, as well as to special isotope fractionations during the flow time. Under certain conditions, isotope measurements can furnish quantitative hydrometric results for the evaluation of components of flow systems. A steady increase of the D content occurs along the watercourses. The waters with the lowest values were found in the source areas of the high mountains where most of the water is freshly fallen rain or snow. The lakes with a large surface area and longer residence times have a difference in D values between the inflow and outflow greater than for smaller lakes that are traversed more rapidly. Between November and June a shift occurs in the average D and 0-18 values towards the negative. This signifies that into early summer a large part of the streams are fed by snowmelt. Descriptors: *Water structure, *Water properties, *Water temperature, *Distillation, *Water purification.
Identifiers: Water surface, Water instability, Schizoid liquid surface, Superheated water, Vapor recoil instability, Reservoir flow.

The study of motions on and beneath the surface of water slightly superheated at its boiling point has been continued. A new form of surface instability by 'onaclovs' has been discovered. The effects of small traces of long chain fatty acids on increasing superheat and decreasing thermal plunge lines have been measured. Measurements have been extended to lower pressures and temperatures. It was found that fatty acids exert greater surface effects at lower temperatures. Surface movements generated by differential vapor recoil have been recorded and published; a new mathematical analysis of vapor recoil has been completed. A distilling system for the production of extremely pure water has been assembled, tested, and maintained in operation for 12 months. The product water has a conductivity of 0.44-0.50 micromphos/cm and is thus within 75% of absolute ionic purity, e.g. 8-12 times purer than commercially available top quality distilled water. Biological tests, repeated over many months, showed that the water was free from living organisms, free from pyrogens, and unable to support growth of Pseudomonas aeroginosa. (OSW)

CONSECUTIVE TITRATION OF CALCIUM AND MAGNESIUM IN ETHANOL-WATER MIXTURE,
Uppsala Univ. (Sweden). Dept. of Analytical Chemistry.
B. Wallen.
Analytical Chemistry, Vol 46, No 2, p 304-305, February, 1974. 1 fig, 1 tab, 11 ref.

Descriptors: *Calcium, *Magnesium, *Analytical techniques, *Volumetric analysis, Water, Mercury, Testing procedures, Laboratory tests, Aqueous solutions, *Pollutant identification.

The result of an analytical procedure normally carried out in water might be improved if performed in a mixed solvent. A method for the simultaneous determination of calcium and magnesium was presented as an example of what can be achieved by changing the medium. With a mercury indicator electrode, two potential breaks were obtained when a mixture of calcium and magnesium was titrated with ethylene glycol bis- (beta-aminoethylether)-N, N-titracetic acid (EGTA) at pH 10 in an aqueous medium containing 70-80% (v/v) ethanol or methanol. In water, only the break corresponding to the titration of calcium was observed. The magnesium end-point break was obtained, however, at the expense of the quality of the calcium endpoint break. To avoid that negative effect, calcium was titrated as usual in water at pH 8.5-9.0. When the end-point break for the calcium titration had been obtained, the titration was interrupted and alcohol added to make the solution 70-80% (v/v) with respect to this component. The pH was raised at the same time to about 10 and the titration continued until the magnesium end-point break was obtained. (Jernigan-Vanderbilt)

G. E. Sigvaldason.
In: Geothermal Energy--Review of Research and Development (Earth Sciences Series, No 12, p 49-59): United Nations Educational, Scientific and Cultural Organization (UNESCO), Paris, France, 1973. 6 fig, 3 tab, 48 ref.

Descriptors: *Geothermal studies, *Geochemistry, *Surveys, *Exploration, Water chemistry, Brines, Chlorides, Thermal water, Hydrothermal studies, Thermal power, Reviews. Identifiers: *Geothermal energy.

In the past ten years geochemical methods have been applied increasingly in the planning and operation of geothermal developments. Geochemical methods are now widely used in preliminary prospecting for potential geothermal exploitation, and chemical data on natural discharge from thermal areas serve as an important guide for decision making on subsurface exploration by drilling. As drilling proceeds, chemical analysis of deep thermal fluids provides information on flow patterns of water and assists in selecting improved drilling sites. During production, testing, and subsequent utilization, chemistry provides an efficient and inexpensive tool to detect minor and major changes in the reservoir, both with regard to temperature and water level fluctuations. THE NORTH ATLANTIC OCEAN AS A SOURCE OF ATMOSPHERIC N2O,
Max-Planck-Institut fuer Chemie, Mainz (West Germany).
J. Hahn.
Tellus, Vol 26, No 1-2, p 160-168, February 1974. 3 fig, 2 tab, 25 ref.

Descriptors: *Surveys, *Basic data collection, *Oceans, Atlantic ocean, Field data, On-site data collections, Gases, Profiles.
Identifiers: *Nitrous oxide.

In 1969, 1970, and 1971 N2O measurements of sea water were carried out during three cruises in the open North Atlantic ocean. Water samples were taken from the sea's surface and from depths down to 3,000 m at several stations. Surface water concentrations in the tropical-subtropical latitudes averaged 0.5 micrograms N2O per liter sea water. For the range from 38.5N to 48.5N, an average of 0.4 micrograms N2O per liter sea water was found. In the area of the Iceland-Faroe ridge, the surface water concentrations averaged 0.4 micrograms N2O per liter sea water when water temperatures were 10C and 0.5 micrograms N2O per liter sea water when water temperatures were 5C. The vertical N2O concentration profiles often show two maxima: a smaller one between 100 and 200 m and a larger one between 400 and 1,000 m with N2O concentrations up to 0.8 micrograms per liter sea water. The North Atlantic sea water is supersaturated with N2O. For the upper sea water layers down to 1,000 m the following average values were obtained from vertical profiles: in tropical latitudes about 66 percent supersaturation, in subtropical latitudes about 47 percent, in the range from 38.5N to 48.5N about 42 percent, and in the area of the Iceland-Faroe ridge about 12-20 percent supersaturation. The North Atlantic ocean acts as a net source of atmospheric N2O. It is probable that the other oceans have the same ability. (Humphreys-ISWS)

CARBON MONOXIDE IN THE SOUTH PACIFIC OCEAN,
Navel Research Lab., Washington, D.C.
J. W. Swinnerton, and R. A. Lamontagne.
Tellus, Vol 26, No 1-2, p 136-142, 1974. 4 fig, 1 tab, 12 ref.

Descriptors: *Surveys, *Basic data collections, *Oceans, Pacific Ocean, Field data, On-site data collections, Gases, Profiles.
Identifiers: *Carbon monoxide.

During an oceanographic cruise of the U.S. Coast Guard icebreaker Glacier in November 1972, both surface sea water and atmospheric samples were collected for carbon monoxide (CO) analysis. The ship followed a cruise track from Long Beach, California to McMurdo Sound in the Antarctic. Atmospheric CO concentrations in the south Pacific were found to be much lower than those measured in the north Pacific, 0.04 ppm to 0.13 ppm, respectively. CO concentrations in sea water of the south Pacific range between 0.00001 and 0.0003 ml/l and compare favorably to levels measured in the oceans of the northern hemisphere. In all sea water samples, the CO was supersaturated relative to the surrounding atmosphere. Sea water CO concentrations were highest in regions of upwelling of water convergence zones. These areas were also associated with high biological activity. Ten vertical profiles of CO in sea water were obtained between Long Beach and McMurdo Sound. In general, the CO concentration was highest in the upper 30 m with a steady decrease to near 0 concentration at 100 m. On the Antarctic sea ice, the highest concentrations of CO were found on the bottom ice which had brown algae penetrating half a meter into the ice. The surface snow exhibited concentrations of CO which were comparable to those found in the surface sea water for the same area. (Humphreys-ISWS)

AMMONIUM ION SPECIFIC ELECTRODE,
Department of Health, Education, and Welfare, Bethesda, Md.
Available from NTIS, Springfield, Va 22161 as PB-220 884, Price $3.25 printed copy; $2.25 microfiche. Patent Application Report PH(G)-250-70, April 1973. 23 p, 6 fig, 1 tab.

Descriptors: *Ammonia, *Ions, *Analytical techniques, *Instrumentation, *Electrodes, Permselective membranes, Water chemistry, Water analysis, Equilibrium, Electrochemistry, Ureas, Enzymes, Pollutant identification.
Identifiers: *Ammonium ion electrodes.

An electrode specific for ammonium ion which is made by covering the surface of a monovalent cationic electrode with a membrane permeable to ammonia but impermeable to interfering cations such as sodium and potassium is described in a patent application. A thin layer of buffer-electrolyte is trapped between the surface of the electrode and the ammonia permeable membrane. The reference electrode is placed, via a small plastic tubing, in the buffer-electrolyte trap. When this electrode device is dipped into a solution containing ammonium ion of which there is equilibrium concentration of ammonia, ammonia gas (dissolved in the sample solution) passes through the gas-permeable membrane over the electrode to again produce ammonium ion. The ammonium ion is potentiometrically sensed by the active surface of the monovalent cationic electrode. (Knapp-USGS)

OREGON'S ESTUARIES: DESCRIPTION AND INFORMATION SOURCES FOR OREGON'S ESTUARIES,
Oregon State Univ., Corvallis.
K. Percy, C. Sutterlin, D. Bella, and P. Klingeman.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-235 373, $6.50 in paper copy, $2.25 in microfiche. Sea Grant College Program, May 1974. 294 p, 27 fig, 170 tab, 155 ref. OWRR C-4108-ORE(No 9057)(1).

Descriptors: *Estuaries, *Oregon, Natural resources, Tides, Drainage basins, Salinity, Sediments, Water quality, Physical properties, Biological properties, Chemical properties, Discharge(Water), Mixing, Water utilization, Information exchange, Estuarine environment.

Information concerning the physical, chemical, and biological characteristics of Oregon's estuaries and of the natural resources found within them has not been available in complete form from any one agency, group or publication. Partial information can be obtained from many different sources if the planner or decision maker knows whom to ask and where to look. This report, while not a complete compilation of facts about the natural resources and related features of Oregon's estuaries, provides a summary of much of the known information about the estuaries and gives numerous citations of literature and agencies from which supporting information may be obtained. The report is intended to provide the planner with a 'starting point' for assembling the required data concerning most of the Oregon estuaries. (Buckley-Oregon)

E. Reimnitz, and P. W. Barnes.
Available from the National Technical Information Service, Springfield, Va 22161, as N73-21328, Price $3.00 printed copy; $2.25 microfiche. Progress Report for period January to March 1973, to Goddard Space Flight Center (1973). 6 p.

Descriptors: *Remote sensing, *Satellites(Artificial), *Erosion, *Ice cover, *Arctic, Sea ice, Ice breakup, Scour, Alaska, Bottom sediments, Aerial photography, Data collections.
Identifiers: Strudel scour, *Beaufort Sea.

Northward flowing rivers of Alaska inundate extensive areas of sea ice during spring breakup. This process was studied under the ERTS-1 program using satellite data. Drainage of large volumes of freshwater through the ice at holes and cracks (strudel) causes scour depressions over 4 m deep, and up to 20 m across in the sea floor below. These modern strudel scours and their filled counterparts were studied by side scan sonar, fathometer, high resolution seismic gear, diving observations, and by sediment sampling. Strudel scours occur within 30 km of river mouths, generally in areas where ERTS imagery shows less potential for drifting ice to scour the bottom than elsewhere. The shapes and distribution patterns of strudel scours correspond with those of strudel seen in the ice canopy. (Knapp-USGS)

SEDIMENT TRANSPORT DUE TO OSCILLATORY WAVES,
California Univ., Berkeley. Hydraulic Engineering Lab.
T. C. MacDonald.
Available from NTIS, Springfield, Va. 22161 as AD-773 463, Price $8.50 printed copy; $2.25 microfiche. Technical Report HEL-2-39, October 1973. 98 p, 28 fig, 3 tab, 22 ref, append. Army Engineers Contract DACW-72-71-C-0024.

Descriptors: *Sediment transport, *Beaches, *Surf, *Waves(Water), Bed load, Suspended load, Hydraulic models, Turbulence, Turbulent flow, Regime, Littoral drift.

A method is given for estimating the amount of sediment in suspension in an oscillating flow such as found near the ocean floor offshore of the breaker zone. The waves causing this suspension are assumed to be of small amplitude and relatively large length, permitting the linearization of the equations of motion and allowing a simpler experimental apparatus. Laboratory measurements of the velocity distribution in a flow simulating the fluid motion resulting from a linearized wave indicate that the practically constant and parallel oscillating flow existing near the ocean bed is reduced to zero velocity in a very thin layer just above the bed. Almost all the shear stresses near the ocean bed resulting from the oscillating flow are contained in this thin layer. In oscillating flow the turbulence intensity is less than in unidirectional flow because of the lower flow velocities; it decays to essentially zero long before the water surface is approached. Because the turbulence in oscillating flow is less, the effect of sediment settling velocity on the distribution of sediment exchange becomes significant and the momentum exchange coefficient no longer approximates the sediment exchange coefficient. By superimposing a small unidirectional flow, such as the mass transport or a coastal current, on oscillating flow, the total amount of sediment transport can be approximated. (Knapp-USGS)

SEDIMENTS OF THE EAST ATLANTIC CONTINENTAL MARGIN--A PRELIMINARY REPORT,
Woods Hole Oceanographic Institution, Mass.
J. D. Milliman.
Technical Report Reference No 72-2, January 1972. 18 p, 10 fig, 4 ref. NFS Grant GX-28193.

Descriptors: *Sedimentation, *Provenance, *Coastal plains, *Continental shelf, *Africa, Mineralogy, Mud, Sands, Silts, Carbonates, Organic matter, Weathering, Deserts, Tropical regions.

The petrology, provenance and history of surficial sediments on the continental margin of Africa were studied using approximately 1000 samples obtained from collections. All sediment studies have been limited to depths less than 500 meters--that is the continental shelf and the upper slope. Three broad depositional areas can be recognized: Gibraltar to Cape Verde, Cape Verde to Liberia, and Liberia to the Niger. Sediments on the shelf and upper slope from Gibraltar to Cape Verde are rich in carbonate, primarily because of the small amount of fluvial sedimentation. The carbonate assemblages are temperate to subtropical. Absence of chemical weathering in this arid climate results in the retention of large amounts of feldspar. South of Cape Verde the sediments become increasingly terrigenous as fluvial sedimentation increases. The carbonate assemblages are subtropical to tropical. The tropical rivers in this area drain chemically-weathered terrain. The

result is a dominance of quartz-rich sediments. Shelf sediments to the south and east of Liberia are dominated by fluvial muds. Many rivers in this area are short and drain coastal hills and mountains that are composed of crystalline rocks. As a result, the sediments tend to be more felspathic than normally would be expected in such a tropical area. Organic content in these sediments is high, probably the result of coastal upwelling as well as the deposition of river-borne plant material. (Knapp-USGS)

LONGSHORE CURRENTS AND THE ONSET OF UPWELLING OVER BOTTOM SLOPE,
Chicago Univ., Ill. Dept. of Geophysical Sciences.
J. Pedlosky.
Journal of Physical Oceanography, Vol 4, No 3, p 310-320, July 1974. 9 fig, 6 ref. NSF Grant GA-28427.

Descriptors: *Upwelling, *Currents(Water), *Mathematical models, *Oceans, Oceanography, Ocean currents, Topography, Coasts, Shores, Velocity, Profiles, Slopes, Stratification, Littoral, Momentum equation, Mathematics, Analytical techniques, Boundary layers.
Identifiers: *Longshore currents, Bottom slope.

The evolution of longshore currents produced by upwelling over shelf-like bottom topography for times long compared to a barotropic spin-up time, but short compared to a diffusion time, revealed in a linear, time-dependent, three-dimensional model that: (1) The topographic constraints yield a steady topographic boundary layer on these short time scales similar in structure to the layer found in an earlier steady-state model. (2) Within a Rossby radius of deformation of the coast a swift equatorward longshore current with a poleward countercurrent is formed. (3) Wind-stress forcing with large north-south scales are the most efficient in driving longshore currents, but do not effectively produce internal Kelvin waves, as do the shorter longshore scales of forcing. Descriptors: *Thermocline, *Massachusetts, *Bays, *Coastal engineering, Oceans, Temperature, Turnovers, Oceanography, Tidal waters, Coasts, Harbors, Hydrography, Surveys, Cooling, Environmental engineering, Water pollution, Water circulation, Meteorology, Ocean currents, Winds, Heated water, Aquatic environment, Waste disposal.
Identifiers: *Nahant Bay(Massachusetts), Bottom water temperatures, Rapid variations.

Rapid 5F to 15F (2.8C to 8.3C) increases of normally stable water temperature at depths of 63 ft to 76 ft (19 m. to 23 m.) in Nahant Bay, Massachusetts were observed during summer in 1972. These rises, which occurred in a few hours and persisted for several days, were apparently caused by temporary replacement of preexisting cooler bottom water by warm surface water which was transported into the bay by northeast winds. Weather records indicate that these events occur in Nahant Bay an average of three times per year between June and September when vertical temperature gradients occur. These rapid bottom water temperature rises are significant from an engineering standpoint because of potential deleterious effects on heated effluent diffusion and on efficiency of circulating water cooling systems. They also represent a natural means by which marine organisms are exposed to thermal stress. (Humphreys-ISWS)

3A. Saline Water Conversion

COMPARISON STUDY OF A 2.5 MGD VERTICAL TUBE EVAPORATOR UPFLOW VERSUS DOWNFLOW,
Fluor Corp. Ltd., Los Angeles, Calif.
M. Marwede, and P. J. Schroeder.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-232 366/AS, $10.25 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-942, May 1974. 82 p, 2 ref. OSW Contract 14-30-2703.

Descriptors: *Design, Evaluations, Investment, *Evaporators, *Cost estimates, *Desalination plants, *Water costs.
Identifiers: Cost breakdowns, Falling film evaporation, Rising film evaporation, *Vertical tube evaporators.

The conceptual design and costs of a 2.5 mgd vertical tube saltwater evaporator with upflow in the vertical tubes were determined and compared to a previous downflow plant. The upflow plant was made identical to the downflow plant except where differences were necessary to carry out the upflow scheme. The areas where the plants differ were studied in more detail. The principal difference between the plants is that the upflow plant does not require effect pumps but does require slightly more area. Capital cost for a 2.5 mgd plant is about 6% lower for the upflow plant. A cost curve shows that this advantage improves as size increases to 10 mgd. Water cost is lowered from $1.13 to $1.08 per 1,000 gal. because of lower capital charges and lower electrical costs. Potential improvements in the upflow process are recommended. (OSW)

Descriptors: *Ion exchange, Operations, *Pilot plants, *Desalination plants, Scaling, Sea water, *North Carolina.
Identifiers: *Desulfating, Operating experiences, *Wrightsville Beach Test Facility(NC).

The operational program of a 75,000 GPD Continuous Ion Exchange Desulfating Pilot Plant located at the Office of Saline Water Wrightsville Beach Test Facility is evaluated for the period July 1969 through November 1970. The Pilot Plant operation included checkout, start-up, operation for gathering of performance data, and operation to furnish feedwater to a Multi-Stage Flash Distillation Pilot Plant. Production of desulfated sea water for use as feedwater permitted Multi-Stage Flash Distillation Plant operation at 350F and a Concentration Ratio of 3.5. This operation was achieved for periods up to 336 hours with no deposition of scale or sludge on the heat exchange surfaces. (OSW)
W74-11629

CONCEPTUAL DESIGN AND COST ESTIMATE OF A VAPOR COMPRESSION VTE/MSF DESALTING PLANT,
Fluor Corp. Ltd., Los Angeles, Calif.

W. A. Bruinsma, M. E. Marwede, and P. J. Schroeder.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-232 698/AS, $16.00 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-962, December 1971. 237 p. OSW Contract 14-30-2956.

Descriptors: *Desalination plants, *Flash distillation, Costs, Estimated costs, Capital costs, Operating costs, *Vapor compression distillation, Turbines, Steam turbines.
Identifiers: Cost breakdowns, Gas turbines.

A conceptual design and cost estimate for an 8 MGD prototype gas turbine powered vapor compression VTE/MSF desalting plant were prepared. The process consists of a 34 effect MSF, a 4 effect VTE, and a 593,200 lb/hr vapor compressor powered by a commercial gas turbine exhausting through a heat recovery boiler. Total capital cost is estimated at $11,840,000, including the desalting plant and sea water intake. Water cost is estimated at $0.59 per 1,000 gallons, assuming a fuel cost of $0.30 per million Btu. (OSW)

OPERATION OF THE 16-STAGE MSF PILOT PLANT--1969-1970,
Envirogenics Co., El Monte, Calif.
R. N. Webb, G. G. Weth, and C. B. Schutt.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-232 699/AS; $11.50 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-966, April 1972. 150 p, 9 ref, 2 append. OSW Contract 14-01-0001-2240.

Descriptors: *Desalination plants, *Pilot plants, *Flash distillation, *Scaling, *Heat transfer.
Identifiers: Deionized feed, pH control, Alkalinity reduction, Feedwater treatment.

Operation of the 16-stage MSF pilot plant from July 1969 through December 1970 is discussed. Results are included for tests using desulfated feed, deionized feed, reduced alkalinity, pH control, CO2 scale suppression pilot plant, a plastic film heat exchanger, three brine heaters, cleaning outside of condenser tubes, and the fouling indicator. Highlights include a 350F, 3.5CF, scale-free test with desulfated feed. (OSW)
W74-11631

EVALUATION OF THE CAPABILITIES OF THE VERTICAL TUBE EVAPORATOR AND THE MULTISTAGE FLASH DISTILLATION DESALINATION PROCESSES.
Fluor Corp. Ltd., Los Angeles, Calif.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-232 713/AS; $18.00 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-960, September 1969. 226 p. OSW Contract 14-01-0001-1830.

Descriptors: Thermodynamics, *Flash distillation, Evaluation, *Desalination plants, *Design criteria, Performance, Operation, *Design data.
Identifiers: Vertical tube evaporators, Double fluted tubes, Enhanced surface tubes.

An evaluation is made on both large and small plants of the vertical tube evaporator and the multistage flash distillation desalination processes. For the large plant comparison, the Office of Saline Water furnished conceptual designs of 250 million gallon per day (MGD) plants prepared by Oak Ridge National Laboratory (ORNL), in which the VTE plant used double-fluted vertical tubes. For the small plant comparison, A-E designs on three 2.5 MGD plants were provided. Two of these were VTE plants furnished in two alternate designs made by the Stearns-Roger Corporation--one using smooth tubes, and the other using enhanced-surface tubes (double-fluted falling-film, and corrugated water-filed tubes). The MSF plant provided for comparison was the 2.5 MGD Universal Plant designed by Burns and Roe, Inc., for the OSW. These designs were reviewed and altered where necessary to make the process and engineering design bases the same for each plant. (OSW)
W74-11632

FOURTH REPORT ON HORIZONTAL-TUBE MULTIPLE-EFFECT (HTME) PROCESS PILOT PLANT TEST PROGRAM,
Universal Desalting Corp., New York.
C. J. Cannizzaro, J. Z. Karpf, N. Kosowski, and A. S. Pascale.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-232 715/AS; $10.50 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-967, July 1972. 121 p, 24 fig, 10 ref, 3 append. OSW Contract 14-01-0001-2247.

Descriptors: *Desalination plants, *Pilot plants, *Heat transfer, Design criteria, *Evaporators, Distillation, *North Carolina, Testing, Design data.
Identifiers: Brine distribution, Chemical cleaning, Pressure drop, *Wrightsville Beach Test Facility(NC), Horizontal tube evaporators.

Results of testing of the three-effect HTME Pilot Plant at the Wrightsville Beach Test Facility are reported for the period from May 1971 to January 1972. During this period, additional heat transfer data were obtained. Boiling coefficient on the outside of tubes and condensing coefficient inside of tubes were determined. A correlation was developed for the condensing coefficients. Photographic studies were made to determine the nature of bubble formation and growth on the outside surface of tubes. The variation of heat transfer coefficients across an HTME tube bundle was measured. Increased heat transfer coefficients, obtained at temperatures above 190F, are reported for tubes enhanced on the outside surface. Tests were conducted to determine the effectiveness of the brine distribution system to obtain uniform distribution of brine over the tube bundle, and results are reported comparing the brine distribution above and below a deep tube bundle. (OSW)
W74-11633

FIFTH REPORT ON HORIZONTAL-TUBE MULTIPLE EFFECT (HTME) PROCESS PILOT PLANT TEST PROGRAM,
Universal Desalting Corp., New York.
J. Z. Karpf, and R. S. Pascale.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-232 720/AS; $9.00 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-963, December, 1972. 91 p, 31 fig, 5 tab, 4 ref. OSW Contract 14-01-0001-2247.

Descriptors: Scaling, *Heat transfer, *Evaporators, *Design criteria, *Pilot plants, *Desalination plants, *North Carolina, Operation, Performance.
Identifiers: Bundle cleaning, Bundle design, Horizontal tube evaporators, *Wrightsville Beach Test Facility(NC).

Development work on the three-effect HTME evaporator at Wrightsville Beach was continued with studies in several areas of design and operation: comparative heat transfer performance of square-, rectangular-, and triangular-pitch tube bundles, influence of steam inlet passage geometry on local heat transfer performance within the bundle, bundle flooding, and feed distribution within a bundle, performance of an HTME evaporator during alkaline and anhydrite scaling, alkaline scale control, and methods of scale removal. W74-11634

DEVELOPMENT PROGRAM AND TEST INSTRUMENTATION FOR VTE/MSF MODULE PLANT, FOUNTAIN VALLEY, CALIFORNIA.
Envirogenics Co., El Monte, Calif.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-232 761/AS; $9.50 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-965, October 1971. 103 p. OSW Contract 14-30-2788.

Descriptors: *Desalination plants, *Flash distillation, *Instrumentation, *California, *Evaporators, Testing.
Identifiers: Modular construction, Prototype, Component test instruments, *Orange County(CA), Vertical tube evaporators.

The Office of Saline Water and the Orange County Water District have undertaken the construction and operation of a prototype VTE/MSF plant at Fountain Valley, California, with an ultimate capacity of 12.5 MGD. The initial plant will be modular in nature and will consist of 4 vertical tube effects and a 5 flash stage feed heater, with a capacity of 3.0 MGD. The 4-effect VTE/MSF module components are already sized for 12.5 MGD capacity and the expansion will consist basically of an increase in evaporator and feed heater length. The program presented in this report is projected to be accomplished during the first year of operation and consists of 16 tasks which are described in detail. (OSW)
W74-11635

DESALINATION MEMBRANES FROM BUILT-UP MULTILAYER FILMS,
Case Western Reserve Univ., Cleveland, Ohio.
T. Fort, Jr., and J. Lando.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-232 364; $5.75 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-944, April 1974. 47 p, 11 fig, 6 tab, 18 ref. OSW Contract 14-30-2913.

Descriptors: *Monomolecular films, *Thin films, *Membranes, Interfaces, *Reverse osmosis, Permselective membranes, Semipermeable membranes, Films, Separation techniques, Pressure, *Desalination, Isotherms.
Identifiers: Multilayers, *Ultrathin films, Microporous supports, *Multilayer apparatus, Vinyl stearate membranes, Pressure-area isotherms, Cellulose acetate membranes.

The feasibility of using composite membranes of Blodgett multilayers on porous backing materials has been investigated. Emphasis has been placed primarily on studying the effects of membrane preparation, thickness, and chemical composition on the product water flux and salt rejection. It is shown that multilayers from vinyl stearate and 2-octadecylacrylic acid can be built and polymerized on porous polysulfone films. The limited salt rejection of these substances is due primarily to the chemistry of the substances along with leakage through defects in the multilayers. Similar results were obtained with multilayers built directly from polyvinylstearate monolayers. Recent work has been concentrated on building multilayer membranes of cellulose acetate. A technique has now developed resulting in membranes showing 91.9% salt rejection at a flux rate of 12.5 gfd at 600 psi and a salt rejection of 89% at a flux rate of 16.8 gfd at 800 psi. (OSW)
W74-11636

CONCEPTUAL DESIGN AND COST ESTIMATE 2.5 MGD DIRECT CONTACT CONDENSATION MULTISTAGE FLASH DESALINATION PLANT,
Fluor Corp. Ltd., Los Angeles, Calif.
Schroeder Marwede.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-232

762/AS; $8.25 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-961, January 1972. 78 p, 4 fig, 12 ref. OSW Contract 14-01-0001-1286.

Descriptors: *Design, Resins, *Heat exchangers, *Flash distillation, *Desalination plants, Plastics, *Cost estimates, Condensation.
Identifiers: Cost breakdowns, Water cost estimates.

The conceptual design and costs of a 2.5 MGD Direct Contact Condensation Multistage Flash Desalination Plant (DCC-MSF) were determined. The process is competitive with other processes such as VTE upflow or VTE downflow plants. Product water was estimated to cost $0.86 per 1000 gallons. Further testing of plant components is recommended. (OSW)

AN INVESTIGATION OF THE VARIABLES AFFECTING STEAM CONDENSATION ON THE OUTSIDE OF A HORIZONTAL TUBE BUNDLE,
Oak Ridge National Lab., Tenn.
D. M. Eissenberg.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-232 365/AS; $11.50 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-943, May 1974. 152 p, 31 fig, 7 tab, 34 ref, 4 append. OSW Contract 14-30-2535.

Descriptors: *Heat transfer, *Distillation, *Condensers, *Desalination apparatus, Tubes.
Identifiers: Multitube, Steam velocity, Thermal performance, *Steam condensers.

The accurate prediction of the thermal performance of large multitube steam condensers for application to the distillation desalination of sea water depends on the availability of correlations for calculating each of the film heat transfer coefficients for individual tubes located within the condenser as a function of local conditions. Although correlations are available, there have been few experimental verifications of their accuracy or even of their validity in the specific application to desalination, particularly with respect to the two film coefficients associated with the condensation process, the condensate film heat transfer coefficient and the non-condensable gas film heat transfer coefficient. A horizontal multitube steam condenser was built and operated in order to investigate the individual and combined effects of steam temperature, steam velocity, condensate rain, and non-condensable gas fraction on the thermal performance of a vertical array of five tubes located within the condenser over the range of interest of each of the variables of importance to the distillation desalination process. Descriptors: *Desalination, *Electrodes, *Electrochemistry, *Ion transport, *Oxidation, *Reduction(Chemical), *Kinetics.
Identifiers: *Rotating disk electrode, Platinum electrodes, Silver electrodes, Gold electrodes, Rate constants, Winkler oxygen analyses.

The kinetics and mechanism of oxygen reduction at platinum were investigated by means of a rotating disk electrode. A kinetic expression for the current for oxygen reduction was developed, taking into account both direct 4-electron reduction of OH- or H2O, and electrochemical reduction via hydrogen peroxide. Possible catalytic decomposition of hydrogen peroxide and loss of H2O2 by diffusion were considered. This expression was used to demonstrate that, in impure neutral saline solutions, oxygen reduction generally proceeds via the peroxide intermediate. The mechanism of activation and deactivation of a platinum surface with respect to oxygen reduction was investigated. Under the experimental conditions, the surface was deactivated by a mixed process of poisoning and desorption of a catalytic layer which had been formed during anodic activation. A miniature version of the Winkler oxygen analysis was developed. This technique permitted an accuracy of +1% when measuring oxygen concentrations of 6-7 ppm. An accuracy of +5% was sometimes obtained at the 0.1 ppm level, but there was a tendency for larger errors to occur because of shortcomings in the sampling procedure. (OSW)

RESEARCH ON ADVANCED MEMBRANES FOR REVERSE OSMOSIS,
Envirogenics Systems Co., El Monte, Calif.
A. F. Graef, W. J. Schell, C. W. Saltonstall, Jr., V. T. Stannett, and H. B. Hopfenberg.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-230 690/AS; $6.25 in paper copy, $2.25 in microfiche. Office of Saline Water Report INT-OSW-RDPR-74-932, March 1974. 52 p, 18 fig, 10 tab, 11 ref. OSW Contract 14-30-2999.

Descriptors: *Reverse osmosis, *Membranes, *Desalination, *Permselective membranes, Semipermeable membranes, Osmosis, Permeability, Thin films, Pressure, Saline water, Sea water, Waste water treatment.
Identifiers: Sulfonated polysulfone, Asymmetric membranes, *Composite membranes, Polyoxetanes, Dense films, Viscosity of sulfonated polysulfone, Swelling agents, Salt rejection, Flux.

This report is concerned with the development of sulfonated polysulfone membranes for the single pass desalting of seawater, and with the potential of such membranes for the reverse-osmosis treatment of other chemically-contaminated waters. Included are results on the synthesis of sulfonated polysulfone, and on the pareparation and testing of dense films and asymmetric membranes derived from the sulfonated polymer. Dense film studies have shown that the various salt forms of sulfonated polysulfone offer excellent flux and salt rejection characteristics, especially when compared to cellulose acetate. The best reverse-osmosis test results to date were obtained with a membrane prepared from a casting solution containing the sodium form of the polymer (ds - 0.42), dioxane, acetone, maleic acid, and water. The solution was cast on silicone-coated paper, gelled in water at 1C, and the membrane was subsequently heat-treated for 5 min at 80C in 50% aqueous sodium nitrate. When tested at 600 psi with 0.3% sodium chloride this membrane exhibited a flux of 9.5 gfd with a salt rejection of 99.4%. Under simulated sea water conditions the flux was 9.8 gfd at a rejection of 96.0%. The observed decrease in rejection is believed to be caused by the presence of voids (about 1,250/cm2 in this particular membrane); and as a result current work is largely concerned with modifications in formulation and in casting conditions for the production of void-free membranes. The modification of polysulfone and other polymeric materials through the radiation grafting of unsaturated monomers, such as 2-vinyl pyridine, also is discussed. (OSW)

DEVELOPMENT OF SEA WATER MEMBRANES, PART I,
Du Pont de Nemours (E.I.) and Co., Wilmington, Del.
N. W. Rosenblatt, J. P. Agrawal, R. A. Halling, and R. C. Rollings.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-230 760/AS; $5.50 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-933, March 1974. 175 p, 50 tab, 43 fig, 19 ref, 4 append. OSW Contract 14-30-2739.

Descriptors: *Desalination, *Reverse osmosis, *Membranes, *Permeability, *Sea water, Pretreatment(Water), *Chelation.
Identifiers: Aromatic polyamides, Fouling control, Transition metals, Two-stage membranes, Salt rejection, Crosslinking.

Development work with the single-stage DP-1 polyamide-hydrazide sea water membrane is described. Reverse osmosis testing with synthetic and with natural sea water was carried out with cells and with tubular configurations. The membrane showed in cells carried out with cells and with tubular configurations. The membrane showed in cells an initial flux of 10-12 gal/sq. ft. X day and a chloride rejection of 99% and better at 1000 psi, 3.5% TDS and 25C. A perforated tube assembly capable of sea water desalination in one-pass was developed. Sustained capacity to recover potable water was demonstrated with tubes and with cells in the lab and in the field. A candidate for the first stage of a two-pass RO process exceeded goal performance. It was developed from the DP-1 polymer by modifying the casting composition and chelating the amidehydrazide with copper. Field and lab tests with cells showed that these higher flux membranes fouled more rapidly than one-pass membranes. Control measures were not as effective as with single-stage membranes. (See also W74-11644) (OSW)
W74-11643

DEVELOPMENT OF SEA WATER MEMBRANES, PART II,
Du Pont de Nemours (E. I.) and Co., Wilmington, Del.
N. W. Rosenblatt, J. P. Agrawal, R. A. Halling, and R. C. Rollings.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-230 707/AS; $5.75 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-934, March 1974. 209 p, 38 tab, 38 fig, 27 ref, 3 append. OSW Contract 14-30-2739.

Descriptors: *Desalination, *Reverse osmosis, *Membranes, *Pretreatment(Water), *Fouling, *Sea water, Capital costs, Operating costs, Systems analysis.
Identifiers: Aromatic polyamides, Polyamide-hydrazide, Spiral modules, Annular cells.

Sea water pretreatment consisting of alum coagulation and filtration with sand and diatomaceous earth filters produced water of high clarity. Chlorination coupled with carbon treatment to remove excess chlorine provided effective disinfection at Ocean City until the carbon beds become contaminated with bacteria. This pretreatment has reduced flux decline in tubular RO devices. Potable water was produced consistently at Ocean City for one year with a sea of annular cells having a membrane area of one square foot. These results confirmed earlier conclusions that compact RO film devices can be used to desalt seawater in one-pass. Several small spiral elements wound with DP-1 membranes showed in the lab 99% rejection at 1000 psi, but flux was significantly lower than in cell tests. A continuous process was developed for casting DP-1 membranes of 12 inch width for spiral elements. These membranes frequently achieved single-stage performance after post-treatment. Capital and operating costs for sea water treatment and for one and two-pass desalination were developed along with necessary supporting information. (See also W74-11643) (OSW)

ANNUAL REPORT - VERTICAL TUBE EVAPORATOR MULTISTAGE FLASH TEST BED PLANT, FREEPORT, TEXAS, MARCH 19, 1971 TO MARCH 31, 1972.
Bechtel Corp., San Francisco, Calif.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-233 316, $20.25 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-976, 1974. 340 p. OSW Contract 14-30-2748.

Descriptors: *Evaporators, *Flash distillation, Heat transfer, Operations, Scaling, *Desalination plants, *Performance, *Testing, Design.
Identifiers: Distributor nozzles.

Management, operation, and maintenance are described of the Vertical Tube Evaporator/Multistage Flash (VTE/MSF) Test Bed Plant at Freeport, Texas by the Bechtel Corporation during the period March 19, 1971 to March 30, 1972. Performance testing has revealed that overall heat transfer coefficients exceed design values. Plant operational stability has been excellent. (OSW)
W74-11807

SUMMARY OF DESALINATION PLANT BRINE DISPOSAL METHODS FOR INLAND LOCATIONS, FINAL REPORT, FEBRUARY 1971.
Fluor Corp. Ltd., Los Angeles, Calif.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-233 151/AS, $11.25 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-978, February 1971. 159 p, 38 fig, 28 tab. OSW Contract 14-01-0001-1286.

Descriptors: *Desalination plants, *Brackish water, *Waste disposal, Economics, Costs, *Brine disposal, Solar stills, *Flash distillation.
Identifiers: Effluent disposal, Seeding techniques, Salt crystallization.

The objective was to determine what process or combination of processes have most potential for economic concentration of desalting plant effluent to solids. The scope is limited to effluent from multi-stage flash (MSF) plants that had as feed water types 4, 5, 9, and 10 waters, being representative of nearly 70 percent of inland brackish waters. Two different processes are recommended depending on boiling point elevation characteristics. No one process is best for all water types. Effluent treating costs range from 19-46 cents/1000 gallons. Abstracts are given for 50 reports issued by the Office of Saline Water relating to the corrosion and performance of materials of construction used in saline water conversion processes. The body of the report is a copy of information stored in a computerized storage and retrieval system for the Materials Information Center of the Office of Saline Water (OSW-MIC) at the Oak Ridge National Laboratory. The abstracts contained in the report are grouped in 14 categories and repeated on occasion if they fall into more than one category. The publication also contains a review of a recently issued report of a survey of materials behavior in multi-stage flash distillation plants. An author index and a keyword index to the reports referenced are given. The keywords, used to identify the content of the reports, have been selected from a thesaurus developed by OSW-MIC. (OSW)

FINAL REPORT STUDY OF THE APPLICATION OF ALUMINUM AS A PRINCIPAL MATERIAL OF CONSTRUCTION IN A 50 MGD MULTISTAGE FLASH DISTILLATION SYSTEM.
Foster Wheeler Corp., Livingston, N.J.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-233 047/AS; $9.25 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-941, May 1974. 94 p, 28 ref. OSW Contract 14-01-0001-1144.

Descriptors: *Design, Condensers, *Aluminum, Heat exchangers, Fabrication, *Desalination plants, *Flash distillation, *Construction materials.

An engineering study is presented for the application of aluminum as a principal material of construction in a 50 MGD multistage flash distillation system. In such a design it may not be feasible to make certain parts such as demisters and orifices of aluminum. In such cases compatible materials shall be used. (OSW)

RESEARCH AND DEVELOPMENT OF COMPOSITE MEMBRANE TECHNOLOGY,
General Atomic Co., San Diego, Calif.
R. L. Riley, C. R. Lyons, G. R. Hightower, M. Tagami, and F. K. Lesan.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-233 043/AS; $8.75 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-948, May 1974. 106 p, 80 fig, 5 tab, 7 ref. OSW Contract 14-30-3016.

Descriptors: *Desalination, *Reverse osmosis, *Membranes, Sea water, *Semipermeable membranes, Membrane processes, Pressure, Thin films, Permselective membranes, Films, Permeability, Separation techniques.
Identifiers: *Composite membranes, Ultrathin membranes, Microporous support, Spiral wound modules, Single stage sea water desalination, Polysulfone, Cellulose triacetate, Cellulose acetate-cellulose nitrate, Non cellulosic reverse osmosis membranes.

A single-stage sea water test plant was designed, constructed, and made operational using the cellulose 2.83 acetate thin-film (250 A) composite membrane in the spiral-wound configuration. The plant, located at Seaworld on Mission Bay in San Diego, California, operates on unacidified sea water (pH=8.0) at an applied pressure of 68 atm (1000 psi) with 24 2-in. by 10-3/4-in. spiral-wound elements, each containing approximately 4 sq ft. of membrane. The sea water feed is pretreated by chlorination and sand filtration. The performance and reliability of the system have been excellent. To date, more than 100,000 hours of element testing have been completed. The total plant output of 850 gal/day corresponds to a membrane flux of about 10 gal/ft squared -day with 5% water recovery. The potable product water contains approximately 90 ppm total dissolved salts. The sodium chloride rejection is 99.75%. (OSW)

FIELD TESTING OF IMPROVED ION EXCHANGE TECHNIQUES,
Culligan, Inc., Northbrook, Ill.
S. A. Bresler, F. Husseini, and E. Kreusch.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-233 035/AS; $12.00 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-970, June 1974. 162 p, 60 fig, 34 tab. OSW Contract 14-30-3059.

Descriptors: *Desalination processes, *Pilot plants, *Ion exchange, Brackish water, *Onsite tests, Separation techniques, Testing.
Identifiers: TriplEx process, QuadruplEx process.

Pilot plant field tests were conducted at four sites to evaluate the potential of some new ion exchange techniques to desalt certain brackish waters. A three bed and four bed system were evaluated. The first bed contains a weak-acid resin, the second bed a strong-acid resin in the hydrogen form, and the third bed a weak-base or intermediate-base resin. In the four bed process, a fourth resin bed contains a strong-acid resin in the sodium form, through which a portion of the water passes. A review of the data indicates that resin performance was in substantial agreement with previously predicted values. (OSW)

PRELIMINARY EVALUATION OF FLUIDIC TECHNIQUES FOR FLOW MODULATION IN THE MULTI-STAGE FLASH DISTILLATION PROCESS,
Bowles Fluidics Corp., Silver Spring, Md.
P. A. Freeman.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-233 186/AS; $8.25 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-974, January 1971. 77 p, 29 fig, 2 append. OSW Contract 14-01-0001-2226.

Descriptors: *Desalination plants, *Control systems, Bubbles, *Flash distillation, *Flow control, Fluid mechanics, *Brines, Design.
Identifiers: Fluidics, Fluidic diverter, Vortex modulator, Bubble gate modulator, Density modulator, Coanda effect, Two-phase fluid flow.

A preliminary evaluation of five fluidic flow modulation techniques to control the flow rate of flashing brine through a typical Multi-Stage Flash Distillation Plant was performed as the initial phase of development of a fluidic automatic brine level control system for the MSF process. A flow modulator based on the fluidic vortex amplifier concept was selected. This concept potentially modulates brine flows to 50% of full flow by bypassing less than 5% of full brine flow from an upstream stage. A preliminary design for the complete brine level control system is presented, based on the vortex modulator and other fluidic techniques. (OSW)

VTE EVAPORATORS FOR GEOTHERMAL BRINES,
Badger (W.L.) Associates, Inc., Ann Arbor, Mich.
F. C. Standiford.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-233 185/AS; $12.75 in paper copy, $2.25 in microfiche. Office of Saline Water Report INT-OSW-RDPR-74-975, June 1972. 150 p, 16 ref. OSW Contract 14-30-2955.

Descriptors: *Desalination processes, *California, Evaluation, *Design, Construction costs, *Evaporators, Evaporation, Heat transfer, *Brines.
Identifiers: *Imperial Valley(CA), *Geothermal brines, Feed brine temperatures, Blowdown concentrations, Heat rejection methods, Downflow heat transfer.

Conceptual designs and costs are presented for VTE evaporators to desalt hot geothermal brines, as from Imperial Valley, California. Basic unit capacity was 4 MGD and brine feed temperature 400F. Variables investigated included physical arrangement, upflow versus downflow heat transfer, feed brine temperature, product recovery ratio, and means of heat rejection. A five-effect downflow VTE rejecting heat to water used for reservoir recharge gave the lowest product cost (11.24 cents/1,000 gallons, exclusive of labor) at 90% load factor and 12% total charges on capital investment. 200 MGD DESALTING PLANT CONCEPTUAL STUDY, ADVANCED THIN FILM DISTILLATION PROCESS AND TEST MODULE DESIGN.
Aqua-Chem, Inc., Waukeska, Wis.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-233 158/AS; $16.75 in paper copy, $2.25 in microfiche. Office of Saline Water Report INT-OSW-RDPR-74-979, October 1970. 219 p. OSW Contract 14-30-2637.

Descriptors: *Desalination plants, *Evaporators, *Flash distillation, *Design, *Water costs, Optimal Development plans.
Identifiers: Optimum combinations, Economic parameters.

The preparation of a conceptual design study of a 200 MGD sea water distillation desalting plant is presented. This large sized plant, intended for construction start about 1976, will bridge the technological gap between present distillation plants and the very large plants of the future. As a first phase of this program, a design was requested for a test module that would firmly establish the process technologies and projected economics of the 200 MGD plant. The distillation plant design recommended in this report incorporates the best engineering knowledge available to date; it also represents a distillation cycle and plant arrangement that will significantly reduce water costs over other available or contemplated plant designs. (OSW)

MSF DISTILLATION PLANT (MODULE), VERTICAL TUBE EVAPORATION (VTEX), SEMI-ANNUAL REPORT, JUNE 1, 1970, THROUGH DECEMBER 31, 1970,
Catalytic, Inc., Philadelphia, Pa.
M. C. Bushkoff.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-233 170/AS, $33.00 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-980, May 1974. 554 p, 207 fig, 27 tab, 13 ref, 13 append. OSW Contract 14-30-2652.

Descriptors: *Desalination plants, *Flash distillation, Heat transfer, Heat balance, Mass transfer, *Tubes, Separation techniques, *Design, Performance.
Identifiers: Brine hydraulics, Vapor-liquid separation.

The activities at the San Diego Test Facility for the period from June 30, 1970, to December 31, 1970, are reported. Emphasis is placed on the development work on the Vertical Tube Bundle Test Vehicle (VTEX). Its primary purpose is to obtain design information for large bundles of doubly fluted tubes. The development activities covered include large bundle heat transfer performance brine hydraulics, vapor-liquid separation, bundle venting, and materials evaluation. Process descriptions and updated flowsheets are presented

together with design and actual mass and energy balances. Plant performance, equipment and materials evaluation are discussed. The multi-Stage Flash (MSF) Test Module was operated only during intermittent shut-downs of the VTEX, and its development program was, of necessity, small. (OSW)

PROTOTYPE REVERSE OSMOSIS WATER PURIFICATION UNIT,
Army Mobility Equipment Research and Development Center, Fort Belvoir, Va.
M. Pressman.
Available from NTIS, Springfield, Va 22161 as AD-769 601, Price $2.75 printed copy; $2.25 microfiche. Report No 2074, September 1973. 15 p, 3 fig, 5 tab.

Descriptors: *Reverse osmosis, *Desalination, *Water treatment, Turbidity, Salinity, Color, Dissolved solids.
Identifiers: *Camp A P Hill(VA).

A field study was made of a prototype 360-GPHA reverse osmosis water purification unit at Camp A.P. Hill, Virginia, during June 1973 to determine the production capacity and the capability of the system for removing color, turbidity, and dissolved salts from a highly colored, stagnant lake water, under field operating conditions. The prototype system, designed to produce 360 gph of product water at a 500-psi feed pressure, is capable of producing, at an average operating pressure of 555 psi, 414 gph of product water at 81F with no color, and with 0.2 Jackson Turbidity Units from a natural feedwater containing 185 units of color and 21 units of turbidity. Additional research is needed to improve the flocculation-clarification process of the filter component. A field method is needed for determining the optimum polymer dosage. (Knapp-USGS)

Descriptors: *Cloud physics, *Atmospheric physics, Laboratory tests, Meteorology, Thunderstorms, Precipitation(Atmospheric), Cloud seeding, Silver iodide, Lightning, *Weather modification, Raindrops.

The physical and chemical processes occurring in the atmosphere were studied in a vertical wind tunnel, having a throat diameter of 2 meters. The distribution of drop size produced by the breakup of large water drops under turbulent conditions was studied through the release of bulk water. The transfer of material as a result of the bursting of bubbles at an airwater interface was used to study the injection of particulate matter and nuclei into the atmosphere. Instruments were developed for the measurement of cirriform clouds, and experiments were carried out on the artificial production of ice-crystal clouds under conditions of supersaturation in the clear air. The role of strong electric fields in the production of ice crystals was investigated. Electrical discharges between clouds of intensely charged aerosols were studied. Improved ice forming nuclei were prepared by modifying the lattice constant of silver iodide. Apparatus for the production of large and intense electric fields was used to study the propagation of corona streamers. Studies of fair-weather atmospheric electricity were carried out. Numerous potential gradient soundings were made. Experiments were carried out establishing the feasibility of directly measuring large potential differences in the atmosphere by the use of a tethered balloon and a nul balancing electrical system. Available from NTIS, Springfield, Va. 22161 as PB-220 674 Price $4.50 printed copy; $2.25 microfiche. Desert Research Institute Reno, Nevada, Final Report to Bureau of Reclamation June 1972. 68 p, 79 fig, 3 tab. USDI Contract 14-06-D-6632-1968.

Descriptors: *Weather modification, *California, *Cloud seeding, Cloud physics, Chemistry of precipitation, Artificial precipitation, Silver iodide, Snow, Rainfall.
Identifiers: Sierra Nevada(CA).

Winter storms were studied in the Sierra Nevada to devise methods of augmenting precipitation. The studies include structure of the cloud systems--their depth and degree of convectivity; water droplet and ice particle economy of the clouds, forming the medium within which hydrometeor generation and growth occurs; transport and diffusion of silver iodide aerosol particles, and the ballistic paths of the hydrometeors; and relation of these factors to the synoptic and mesoscale characteristics of the storm. The systems necessary to make these studies include an instrumented aircraft capable of flying for long periods in storm conditions; a mountaintop radar, the data from which are transmitted by landline to the laboratory where they are presented in real time and stored on magnetic tape for later analysis; a trace analysis laboratory for the determination of the silver content of snow; and a mesoscale network of precipitation gages and snow sampling towers. (Knapp-USGS)

EXPERIMENTAL RESEARCH IN THE ARTIFICIAL CONTROL OF PRECIPITATION DURING THE COLD PERIOD OF YEAR ON AN EXPERIMENTAL METEOROLOGICAL RANGE,
B. N. Leskow, and I. P. Polovin.
Available from NTIS, Springfield, Va. 22161 as AD-772 006 Price $3.00 printed copy; $2.25 microfiche. Air Force Foreign Technology Division Machine Translation FTD-MT-24-216-74, November 1973. 13 p, 2 fig, 1 tab, 25 ref. (Translated from Trudy v Vsesoyuznogo Meteorologicheskogo S'Yezda, Sektsiya Aktivnykh Vozdeystviy na Atmosfernyye Protsessy, Vol 4, p 53-61, 1972).

Descriptors: *Cloud seeding, *Artificial precipitation, Meteorology, Weather modification, Cloud physics, Water yield improvement.
Identifiers: *USSR.

Many experiments have been conducted on the experimental meteorological range of UkrNIGMI (Ukrainian Scientific Research Hydrometeorological Institute) on the effect on supercooled clouds of laminar forms for the purpose of studying artificial control of precipitation during the cold period of the year. Dry ice was introduced from an aircraft as the reagent. The aircraft flies at the level of the upper limit of a cloud layer suitable for seeding. The line of seeding is perpendicular to the wind direction at the level of flight and is constant relative to the terrain. The location of this line is selected in such a way that artificial precipitation would fall out near the center of the area with the dense precipitation-measurement network. The increase in precipitation in experiments for the most part was 0.5-1 mm, but in some experiments it reached 2.44 mm. The average change in the precipitation calculated from all experiments was +0.74 mm with the average duration of effect 2 h, 10 min. The relative increase decrease with an increase in the intensity of natural precipitation. Weak natural precipitation was increased in the experiments by 200% or more, average precipitation by 80%-120%, and strong precipitation by 40%-50%. The average relative increase calculated for all experiments was 100%. (Knapp-USGS)

Descriptors: *Return flow, *Salinity, Evapotranspiration, Plant growth, Management, Soil water, Salts, *Model studies, *Irrigation practices, *Water quality control, Evaluation, Hydrologic models, Costs.
Identifiers: Economic models.

A physical and economic model has been devised to evaluate irrigation practices as related to irrigation return flow. The physical model requires data of soil water properties, irrigation rates and amounts, potential evapotranspiration and plant rooting properties. Output data include salt and water flow into the water table and relative transpiration. The economic model requires data on cost of irrigation, value of crop, cost of production etc. Output data include net revenue and shadow price as a function of salt outflow. The model predicts that net revenue increases as salt flow increases and that the shadow price (the increase in revenue per unit increase in salt outflow) falls off rapidly as salt outflow increases. It would appear that reasonable water management practices could be achieved that reduce salt outflow on the farm at about a cost of $1 per ton.

WATER SUPPLIES AND COST IN RELATION TO FARM RESOURCE USE DECISIONS AND PROFITS ON SACRAMENTO VALLEY FARMS,
California Univ., Davis. Dept. of Agricultural Economics.
T. R. Hedges.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 310, $4.50 in paper copy, $2.25 in microfiche. Giannini Foundation Research Report No 320, March 1974. (California Water Resources Center Project UCAL-WRC-W-111). 93 p, 11 fig, 17 tab, 34 ref. OWRT-B-068-CAL(1).

Descriptors: *Water supply, *Water costs, Economics, *California, *Crop production, *Input-output analysis, Irrigation practices, *Linear programming, Profit, Farm prices, Water allocation(Policy), *Farm management.
Identifiers: *Sacramento Valley(Calif).

This study of the mixed crop agricultural economy of Sacramento Valley, California identifies and establishes physical input-output relationships for water and crop yields within relevant ranges, evaluates the impact of prices for products and costs for input factors upon water allocation among such crops and alternative irrigation practices and maximum earnings and profits. Linear programming is used to evaluate the various constraints of water supply, land quality, crop prices, and input costs for the several crops and sizes of farms. Two sizes of farms are analyzed in the study: (1) The 1,280 acre model farm is typical of the rice-barley-bean large farm situated on basin soils in the upper Sacramento Valley. Tomatoes and sugar beets enter the cropping mix for this size

farm under certain high-price low-cost situations of abundant water supply. (2) The 640 acre model farm is typical of the tomato-sugar beet-bean-hay mixed crop farm on alluvial soils of the lower Sacramento Valley. The tomato-beet-hay crop mix is optimal for abundant low-cost water situations but increasing costs and/or decreasing water supply brings barley, safflower, and wheat into the mix. 4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

METHODS OF FLOOD FLOW DETERMINATION IN SPARSE DATA REGIONS,
Alaska Univ., College. Inst. of Water Resources.
R. F. Carlson, P. M. Fox, and S. D. Shrader.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-235 261; $3.25 in paper copy, $2.25 in microfiche. Partial Completion Report No LWR-52, June, 1974. 37 p, 2 fig, 40 ref, append. OWRTB-021-ALAS(1).

Descriptors: *Alaska, *Design flood, History, *Hydrologic data, Statistical methods, Rational formula, Reliability, *Flood frequency, Peak discharge, *Flood forecasting, Graphical analysis.
Identifiers: Physiographic regions, Emperical formulae, Graphical analysis.

Three issues must be undeslo when embarking on a flood frequency design task: the fundamental basis of the design method, actual execution of the task, and the data environment. A survey of the history and background of the many methods of flood frequency determination is included, followed by a description of the methods currently used by design agencies in Alaska. The physical environment of Alaska is described including identification of four homogenous physiographic regions. The data conditions are also described for these regions. With this information three methods were chosen for further evaluation: log Pearson type III, graphical and regional multiple regression. These methods were chosen primarily on the basis of applicability to sparse data regions; ease of calculation; superficial satisfaction of underlying assumptions; and general acceptance and/or previous use in Alaska.

Available from the National Technical Information Service, Springfield, Va. 22161 as PB-235 262; $3.00 in paper copy, $2.25 in microfiche. Completion Report No IWR-55, July, 1974. 15 p, 1 fig, 3 ref. OWRTB-021-ALAS(2).

Descriptors: *Flood frequency, Snowmelt, Energy budget, Probability, Evaluation, Design flood, *Alaska, Model studies, *Flood forecasting, Hydrologic data.
Identifiers: *Snowmelt models, *Kinematic waves, Log Pearson type III.

With the increased emphasis placed on resource extraction in Northern regions, consideration of the effects of sparse data on flood frequency estimation required for design decision is needed. Results are summarized of a project designed to deal with those needs. Following a survey of existing methods and current physiographic and data conditions three methods were chosen to be compared using data from eleven diverse basins in Alaska. These three methods were compared on the basis of efficiency, consistency, and power as well as record length requirements, and satisfaction of underlying assumptions. A heat budget type snowmelt model was modified for use on the Chena River basin, and checked with snow survey data for accuracy. The output from the model was then used for flood predictions with a hybrid flood frequency model which combined stochastic input and kinematic wave theory. This fourth approach was also evaluated. Criteria were developed to determine which method is applicable for a given situation. Due to the variability of the physical and data environment of northern regions, no one method should be strictly adhered to for flood frequency determination.

Identifiers: *Axial flow pumps, Mechanical pumping, *Pump design.

The objective was to evaluate reservoir stratification causing degradation of large volumes of water each summer. Many attempts have been made to destratify lakes. Generally, destratification devices have large power requirements. The first phase of this research involved the design, construction and testing of a high volume, low head destratification pump. In the second phase this axial flow pump was modified and was capable of moving 0.99 cubic meters per second of water from near the surface to near the bottom of the lake using 373 watts. The chief objective of the second phase was to determine the effectiveness of the pump as a destratification device. Fifteen days were required to lower the stability of a 40 hectare lake to near zero. The destratification efficiency was 4.6%. Destratification of all physical-chemical parameters was observed. Future research could involve a long term biological study of the effect of destratification, operation of larger pump on a larger lake and model studies required to fit pump design to lake size.

FLOOD PLAIN INFORMATION, OHIO RIVER: OHIO COUNTY, WEST VIRGINIA.
Army Engineer District, Pittsburgh, Pa.
Prepared for: The Wheeling-Ohio County Planning Commission and The State of West Virginia Department of Natural Resources, December, 1971. 47 p, 10 fig, 16 plates, 11 tab, glossary.

Descriptors: *Floodplain, *Flood control, *Ohio River, *Flood profiles, *Flood protection, Locks, Dams, Flood frequency, Rivers, Bridges, Tributaries, Gages, Gaging, Flood forecasting, Flow, Obstructions to flow.
Identifiers: Ohio County(W Va), Wheeling(W Va), Wheeling Creek(W Va), Intermediate Regional Flood(IRF), Standard Project Flood(SPF).

Wheeling is the major city of Ohio County which is situated on the left or east bank of the Ohio River from Mile 81.5 to 92.9 downstream of Pittsburgh, Pa. Above Ohio County the Ohio River has a moderately wide floodplain and relatively flat river gradient (a slope of 0.6 ft/mi for the report reach). Wheeling Creek is a major tributary and is itself subject to flooding. The main flood season is December through April and flood duration is relatively long. Major obstructions to Ohio River flows are Locks and Dams 12 and 13 which will be replaced by the Hannibal Locks and Dam, a structure equipped with gates to allow underpassage of flows. Possible obstructions to Wheeling Creek flows are 11 railroad bridges, 21 highway bridges and 1 foot bridge. Thirteen upstream flood control projects are effective in reducing flood levels on the Ohio River in Ohio County from 6 to 9 feet. A watershed plan for Wheeling Creek, proposing the construction of 6 flood control dams and one multipurpose dam is nearing completion. Using gage records for a 108 year continuous period, characteristics of an Intermediate Regional Flood (IRF) on the Ohio River were determined. With a peak discharge of 394,000 cubic ft./sec. and an elevation of 659.0 m.s.l. on Lock and Dam 12 upper gage, an IRF will rise 1.1 foot above the March 1964 flood, the last major disaster, and 7 feet below the March, 1936 flood which discharged 499,000 cfs. and was the greatest flood on the Ohio in this area. Similarly, an IRF on Wheeling Creek would discharge 31,500 cfs., compared to 52,000 cfs. for a Standard Project Flood, considered a reasonable upper limit of flooding. Complete flood profiles were compiled for these hypothetical floods, and are presented on topographic maps. (LaPointe-North Carolina)

APPLICATION OF REMOTE SENSING IN THE STUDY OF VEGETATION AND SOILS IN IDAHO,
Idaho Univ., Moscow. Coll. of Forestry, Wildlife and Range Sciences.
E. W. Tisdale.
Available from NTIS, Springfield, Va. 22161 as N73-22287, Price $3.00 printed copy; $2.25 microfiche. Interim Contract Report for NASA, Goddard Space Flight Center, May 1973. 17 p, 1 tab, 2 append. NASA Contract NAS5-21850.

Descriptors: *Remote sensing, *Satellites(Artificial), *Land use, *Idaho, Soil investigations, Mapping, Data collections, Terrain analysis, Grasslands.

ERTS and U-2 multispectral imagery was used to inventory and monitor renewable natural resources in Idaho with particular emphasis on natural vegetation. Sagebrush, cheatgrass, and artificially seeded ranges were readily identified as well as woodland, dense forest, and riparian vegetation. Irrigated farm areas were readily segreated from those where dryland cropping is practiced. Lakes, reservoirs, ponds, and river channels were easily identified in MSS-7. In general, vegetational patterns are more discernible in MSS-5 than in other bands. Water bodies are best defined in MSS-7. Geologic features show up well in both MSS-5 and MSS-7. U-2 imagery provides considerable additional information and is highly useful in separation of major sagebrush-grass types. Imagery during the growing season (spring) should aid in the separation of range types on the basis of their moisture status. (Knapp-USGS)
W74-11738

ESTIMATING FLOOD DISCHARGES IN NEVADA USING CHANNEL-GEOMETRY MEASUREMENTS,
Geological Survey, Carson City, Nev.
D. O. Moore.
Nevada Highway Department Hydrologic Report No 1, 1974. 43 p, 46 fig, 1 tab, 5 ref, append.

Descriptors: *Floods, *Nevada, *Peak discharge, *Channel morphology, Alluvial channels, Discharge(Water), Flood frequency, Flood recurrence interval.

An empirical method is given for reliably estimating 10-year recurrence-interval floods in Nevada.

This flood characteristic is related to the width and average depth of stream channel cross sections between point and channel bars. Different relations are required to estimate the flood discharges for different areas within Nevada, because the State is not homogeneous with respect to flood characteristics. Also, relations are different for ephemeral and perennial streams. The standard error of estimate for the 10-year flood, in both ephemeral and perennial channels throughout the State, is about 40 percent. No relation was developed to estimate floods for perennial streams in southern Nevada due to the limited data available. A relation was developed between the 10 and 25 year recurrence-interval floods, which may be used to estimate the 25-year recurrence-interval flood. (Knapp-USGS)

MISSISSIPPI RIVER WATER FROM TEXAS,
Universidad Nacional de Nicaragua, Managua.
O. Arguello, and R. G. Kazmann.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 99, No IR4, Paper 10212, p 441-448, December 1973. 2 fig, 1 tab, 7 ref. OWRR A-016-LA(3).

Descriptors: *Inter-basin transfers, *Mississippi River, *Louisiana, *Texas, Water resources development, Water transfer, Diversion.

The impact of removing 12,000,000 acre-ft annually from the Mississippi River for export to the High Plains of Texas was studied by a mathematical model that utilized the daily discharge of the river for the 1928-1967 period as its basis. Constraints were the salinity of the River at Port Sulphur and New Orleans, available reservoir storage in Texas, and rates of diversion ranging from 18,000 cfs to 28,000 cfs. A diversion rate of at least 24,000 cfs was found necessary in order to reduce the duration of diversion. Diversion at a lesser rate and longer period would increase the number of days of abnormally salty river water at New Orleans. The total annual cost of water is estimated to be between $72 per acre-ft and $114 per acre-ft delivered. (Knapp-USGS)

CITY OF MANCHESTER--MAIN DRAINAGE WORK 6,
D. N. Young.
The Institution of Municipal Engineers Journal, Vol 101, No 4, p 109-116, April, 1974. 4 fig.

Descriptors: *Drainage area, *City planning, *Design criteria, History, Flow, Monitoring, Sampling, Sewer systems, Automation, Recording, Runoff, Gauges, Models.
Identifiers: *United Kingdom(Manchester-Eng).

Developments of main drainage facilities within the city of Manchester since 1885 and present measures taken to improve the redevelopment requirements of the Openshaw area are described. Storm overflow, old mine workings, and coal seams from a colliery are taken into account in the general design. Over the past year, research work by the city engineer and surveyor's department was done on the volume of flow generated within a catchment area together with the efficient performance of stilling pond storm water overflows. Flows will be monitored from this area by an automatic pneumatic depth recorder for both dry weather and storm water sewers. Ultimately sampling equipment will be expanded. By automatic rainfall intensity recording gauges, theoretical and actual runoff will be compared. In addition, assessment of the performance of the performance of the stilling pond type overflow will be made. These results should provide information for further design criteria for sewer systems in the area. (Prague-FIRL)

A HYDROLOGICAL STUDY OF THE SOUTHERN SUDD REGION OF THE UPPER NILE,
Institute of Hydrology, Wallingford (England).
J. V. Sutcliffe.
Hydrological Sciences Bulletin, Vol 19, No 2, p 237-255, June 1974. 10 fig, 3 tab, 9 ref.

Descriptors: *Hydrologic aspects, *Water resources, *Watersheds(Basins), *Rivers, Hydrology, Floods, Discharge(Water), Water levels, Hydrologic data, Drainage, Surface waters, Vegetation, Control, Land management, Flooding, Flow rates, River flow, Topography, Slopes, Flood plains, Regional economics.
Identifiers: *Sudan(White Nile).

The economy is closely linked to the natural river regime; any control of the 160 km reach of the White Nile River from Juba to Bor (Sudan) will have far-reaching consequences for the local inhabitants. Data on vegetation and water levels were obtained for 43 cross sections of the river valley. The alluvial bank of the main river and all spill channels were surveyed for two sample reaches. The seasonal range of river flow at Mongalla was related to the climate and lake storage upstream. The topography of the flood-plain was described. Analysis of the flood-plain cross sections revealed a succession of gradients caused by recent deposition in discontinuous basins below the river levels, and study of gauge records confirmed a change in river profile. The basins act as auxiliary channels and also as a series of damping reservoirs which store water and return it to the river. The vegetation distribution on the flood-plain revealed that flooding controlled the vegetation. The economy of the area was closely related to the hydrological conditions. Flooding conditions and climatic variations limited the area of different grasses. Where the climate made crop yields unreliable, the seasonal fluctuations in river level provided grazing during the dry season making a pastoral economy possible. (Humphreys-ISWS)

REMOTE SENSING STUDY OF LAND USE AND SEDIMENTATION IN THE ROSS BARNETT RESERVOIR, JACKSON, MISSISSIPPI, AREA,
University of Southern Mississippi, Hattiesburg.
W. T. Mealor, Jr., J. W. Pinson, D. L. Wertz, C. M. Hoskin, and D. C. Williams.
Available from NTIS, Springfield, Va. 22161 as N73-18396, Price $7.00 printed copy; $2.25 microfiche. First Annual Contract Report to National Aeronautics and Space Administration, 1973. 81 p, 6 fig, 6 append. NASA Grant NGL 25-005-007.

Descriptors: *Remote sensing, *Land use, *Sedimentation, *Mississippi, Reservoir silting, Urban runoff, Aerial photography, Water pollution sources, Cities.
Identifiers: Jackson(MS), Ross Barnett Reservoir(MS).

Sediment and other culturally induced affluents in the Ross Barnett Reservoir, Mississippi, and their spatial linkages and relationships with land use and site characteristics were studied using remote sensing techniques. The principal objectives of the Ross Barnett Reservoir study are the determination through remote sensing techniques of (1) land use types, (2) effect of land use on erosion within the immediate vicinity of the reservoir, (3) the suspended sediment within the reservoir, and (4) correlation of suspended sediment with land use in the immediate reservoir vicinity. SEEPAGE IN MISSISSIPPI RIVER BANKS: REPORT 1, ANALYSIS OF TRANSIENT SEEPAGE USING A VISCOUS-FLOW MODEL AND THE

FINITE DIFFERENCE AND FINITE ELEMENT METHODS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Soils and Pavements Lab.
C. M. Desai.
Available from NTIS, Springfield, Va 22161 as AD-762 556, Price $3.00 printed copy; $2.25 microfiche. Technical Report S-73-5, May 1973. 105 p, 45 fig, 2 tab, 59 ref, 1 append.

Descriptors: *Seepage, *Bank storage, *Mississippi River, *Bank stability, Surface-groundwater relationships, Bank protection, Erosion control, Numerical analysis, Hydraulic models.

The stability of the banks of the Mississippi River is dependent in part upon seepage conditions induced by variations in the river level. The drawdown conditions are significant for the design of stable riverbank slopes and protective structures. A parallel-plate, viscous-flow model was designed and constructed for the purpose of conducting tests that simulate seepage conditions and variations of external water levels in the field. A finite difference scheme was developed for solving approximate equations governing one- and two-dimensional fluid flow. (Knapp-USGS)
W74-11989

AN APPROACH TO ESTIMATING FLOOD FREQUENCY FOR URBAN AREAS IN OKLAHOMA,
Geological Survey, Oklahoma City, Okla.
V. B. Sauer.
Water Resources Investigations 23-74, July 1974. 10 p, 3 fig, 11 ref.

Descriptors: *Flood frequency, *Urban hydrology, *Oklahoma, *Urban runoff, *Storm runoff, Urbanization, Peak discharge, Rainfall intensity, Flood recurrence interval.

Flood-frequency studies for urban areas in several parts of the United States and flood-frequency relations for natural streams of Oklahoma were used to develop a set of flood-frequency equations for urban areas of Oklahoma. Equations are presented for estimating the 2-, 5-, 10-, 25-, 50-, and 100-year flood-peak discharges for basins of 0.5 to 100 square miles. Flood-frequency data for urban areas in Oklahoma are virtually nonexistent; therefore, the accuracy of the urban equations cannot be determined. The general form of the equations could be used in an area outside Oklahoma where the assumptions can be accepted. (Knapp-USGS)

Descriptors: *Hydrogeology, *Groundwater, *Groundwater resources, *Aquifers, *Engineering geology, Geomorphology, Structural geology, Geologic mapping, Stratigraphy, Geologic time, Water types, Mineral water, Industrial water, Water utilization, Water supply, Water conservation, Water analysis, Boreholes, Forecasting, Zoning.
Identifiers: *USSR, Voronezh oblast, Kursk oblast, Belgorod oblast, Bryansk oblast, Orlov oblast, Lipetsk oblast, Tambov oblast, Tectonics.

Volume 4 in the series 'Hydrogeology of the USSR' contains a detailed hydrogeologic and engineering-geologic description of the Voronezh, Kursk, Bryansk, Orlov, Lipetsk, Tambov, and Belgorod Oblasts. A history of areal hydrogeologic and engineering-geologic investigations, and basic factors influencing formation and distribution of groundwater are reviewed. Aquifers and problems of their regime, formation, and zonality are described, and the role of groundwater in the national economy of the Oblasts is examined. Ways are outlined for solving problems of water supply of large industrial centers and mining enterprises, and projections are made of groundwater use for 1980 and the year 2000. Tabulated results of groundwater chemical analyses and a catalog of boreholes plotted on a hydrogeologic map of Mesozoic-Cenozoic, Paleozoic, and Archean-Proterozoic deposits are appended. (Josefson-USGS)

Descriptors: *Hydrogeology, *Groundwater, *Groundwater basins, *Aquifers, *Engineering geology, Geomorphology, Structural geology, Geologic mapping, Stratigraphy, Water types, Connate water, Confined water, Mineral water, Industrial water, Water utilization, Water supply, Water conservation, Mineralogy, Zoning, History.
Identifiers: *USSR, Kemerovo oblast, Altay territory, Tectonics.

Volume 17 in the series 'Hydrogeology of the USSR' describes hydrogeologic and engineering-geologic conditions in the Kemerovo Oblast and Altay Territory, covering 357,000 sq km. A history of areal hydrogeologic and engineering-geologic investigations, and natural factors influencing groundwater formation are reviewed. Use of fresh groundwater in the national economy, hydrogeology of mineral deposits, and hydrogeologic and engineering-geologic zoning of the area are examined. A hydrogeologic map of the Kemerovo Oblast and Altay Territory at a scale 1:1,000,000, and an engineering-geologic map of the Oblast and Territory at a scale of 1:2,500,000 are appended. Descriptors: *Hydrogeology, *Groundwater, *Aquifers, *Permafrost, *Engineering geology, Geomorphology, Structural geology, Geologic mapping, Geologic time, Water types, Thermal water, Mineral water, Water utilization, Water supply, Water conservation, Mineralogy, Placer mining, Coals, Zoning, History.
Identifiers: *USSR, Soviet North East, Magadan oblast, Kamchatka oblast, Khabarovsk territory, Taliks, Ice lenses, Tectonics.

The Soviet North East, described in Volume 26 in the series 'Hydrogeology of the USSR' includes the Magadan Oblast, the northern part of Kamchatka Oblast (Koryak National District), and the northeastern part of Khabarovsk Territory (Okhotsk Rayon). Physiographic, geologic, permafrost, and hydrogeologic conditions in the area are described, and characteristics of groundwater formation are examined. Attention is focused on problems of formation of taliks and ice lenses and on their role in water resources development. Groundwater use in the national economy, and effect of industrial activities of man on hydrogeologic and permafrost conditions are discussed. A hydrogeologic map of the Soviet North East at a scale of 1:2,500,000 is appended. (Josefson-USGS)

REGIONAL DEVELOPMENT OF GROUNDWATER RESOURCES IN COMBINATION WITH SURFACE WATERS,
Water Resources Board, Reading (England).
R. A. Downing, D. B. Oakes, W. B. Wilkinson, and C. E. Wright.
Journal of Hydrology, Vol 22, No 1/2, p 155-177, June 1974. 7 fig, 22 ref.

Descriptors: *Conjunctive use, *Water resources development, *Regional development, Optimum development plans, Aquifers, Groundwater, Surface waters, Water yield.
Identifiers: *United Kingdom.

As the demand for water in the United Kingdom increases during the latter part of this century, it will be necessary to derive optimum benefits from groundwater storage. This will involve the conjunctive use of surface and groundwater resources to provide water for supply and yet maintain adequate river flows for amenity and other purposes. The investigations necessary before the development of conjunctive use schemes are assessment of yield for surface water and groundwater and evaluation of hydrogeological factors affecting aquifer yield. The value of mathematical models in the design and management stages of such schemes and some of the constraints influencing the regional development of aquifers in the United Kingdom are discussed. Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY8, Proceedings Paper 10746, p 1119-1131, August 1974. 7 fig, 28 ref, 2 append.

Descriptors: *Seepage, *Groundwater, *Model studies, *Dewatering, Canal seepage, Groundwater movement, Hydraulics, Flow, Seepage control, Penetration, Drainage, Drawdown, Open channels, Water wells, Well data, Hydrology, Mathematics, Darcy's law, Finite element analysis, Flow resistance, Energy loss, Steady flow, Application methods.
Identifiers: *Seepage resistance, *Partial well penetration, St. Venant principle, Well systems.

The method of additional seepage resistances based on the local consideration of zones of sharp flow deformation caused by partially penetrating boundaries is described. The allowance for the replacements of the additional resistance by an equivalent resistance to a horizontal flow through an extra length has the advantage of simplifying the subsequent calculating procedure. The application is given for the flow into open partially penetrating channels, to multiple well systems of complete or partial penetration, and to a single well of partial penetration. The examples showed the nature of the additional seepage resistances was identical regardless of the type of partial penetrating boundary. (Humphreys-ISWS)

COMPUTER MODEL FOR DETERMINING BANK STORAGE AT HUNGRY HORSE RESERVOIR, NORTHWESTERN MONTANA,
Geological Survey, Washington, D.C.
T. H. Thompson.
Available from Superintendent of Documents, Washington, D.C. 20402, Price $0.65 (paper cover). Professional Paper 833, 1974. 16 p, 7 fig, 4 tab, 8 ref.

Descriptors: *Bank storage, *Reservoirs, *Montana, *Surface-groundwater relationships, *Mathematical models, Water level fluctuations, Water table, Columbia River, Computer programs, *Computer models.
Identifiers: *Hungry Horse Reservoir(MT).

A mathematical model was developed to compute bank storage at Hungry Horse Reservoir in northwestern Montana. The model uses daily reservoir elevations as an input parameter. Monthly accumulated bank-storage volumes were calculated for the period October 1951 through September 1972. An estimated 5.8% of the usable reservoir storage volume would be available from bank storage for at-site power generation and downstream benefits if the reservoir was subjected to a long-term, cyclic drawdown. Several model configurations were evaluated. However, the accuracy of the solution using the recommended configuration is within the accuracy limits of the input parameters. The model sensitivity was evaluated by comparing the results of the model before and after a parameter was changed a fixed percentage while holding the other parameters constant. The model is most sensitive to changes in aquifer width on an annual basis and to changes in the storage coefficient on a seasonal basis. The computer model can be used to compute bank-storage volumes whenever historical or assumed elevations are available for Hungry Horse Reservoir. The parameters can be changed to estimate bank-storage volumes at other reservoirs having similar geologic, physiographic, and hydrologic conditions. (Knapp-USGS)

ELECTRIC-ANALOG SIMULATION NETWORK OF UNCONSOLIDATED AQUIFERS IN THE UPPER WABASH RIVER BASIN, INDIANA,
Geological Survey, Indianapolis, Ind.
J. E. Heisel.
Available from NTIS, Springfield, Va. 22161 as PB-226 227, Price $3.75 printed copy; $2.25 microfiche. Water-Resources Investigations 29-73, September 1973. 26 p, 11 fig, 3 tab, 13 ref.

Descriptors: *Groundwater movement, *Analog models, *Model studies, *Indiana, Glacial drift, Alluvium, Hydrogeology, Surface-groundwater relationships.
Identifiers: *Wabash River basin(IN).

The groundwater budget of the unconsolidated deposits in the upper Wabash River basin was modeled. An electrical-simulation network was used to determine an integrated storage coefficient of 0.003 for the basin. Two practical problems were investigated: a municipal pumping problem and the change in flow regime due to the addition of surface-water reservoirs to the basin. The network is available and can be used to determine the effect on basin hydrology due to local development of the groundwater resource. (Knapp-USGS)

DETECTION OF SUBSURFACE CAVITIES,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Soils and Pavements Lab.
E. R. Bates.
Available from NTIS, Springfield, Va 22161 as AD-762 538, Price $7.00 printed copy; $2.25 microfiche. Miscellaneous Paper S-73-40, June 1973. 81 p, 27 fig, 28 ref, append.

Descriptors: *Geophysics, *Electrical studies, *Caves, Karst, Seismic studies, Remote sensing, Subsurface investigations, Borehole geophysics, Underground.
Identifiers: *Underground cavities.

Geophysical and remote-sensing methods were applied to the problem of detecting underground cavities. None of the remote-sensing (airborne) methods showed any promise for detecting specific cavities because their practical and theoretical capabilities of depth penetration and resolution precluded this application. However, they may be useful in selecting areas for more detailed study by other methods. The geophysical methods that showed the most promise were variations of seismic subsurface profiling and various electrical geophysical prospecting methods. Seismic methods were successful only in detecting cavities whose radii equalled the depth of overburden. Self-potential, equipotential, and electrical resistivity surveys all show some success. A new process of data interpretation was developed for one specific electrode configuration. The modified procedure produced excellent results during field tests over known cavities in Indiana and Missouri. Cavities less than 10 ft in diameter and at depths greater than 100 ft were located. (Knapp-USGS)

THE ROLE OF GEOLOGY AND HYDROLOGY IN GEOTHERMAL EXPLORATION,
United Nations, New York. Resources and Transport Div.
J. R. McNitt.
In: Geothermal Energy--Review of Research and Development (Earth Sciences Series, No 12, p33-40): United Nations Educational, Scientific and Cultural Organization (UNESCO), Paris, France, 1973. 45 ref.

Descriptors: *Hydrology, *Geology, *Hydrogeology, *Geothermal studies, Reviews, Thermal water, Exploration, Surveys, Investigations, Geophysics.
Identifiers: *Geothermal energy.

The application of the sciences of geology and hydrology to the exploration of geothermal resources, and in particular, how geology is interrelated to the more specialized disciplines of geochemistry and geophysics are reviewed. No single criterion or 'rule' can be followed in selected promising thermal areas for further prospecting. Each area must be considered individually, and valid conclusions can be reached only be evaluating all relevant data within the framework of the total geologic environment. Of all geophysical methods used for thermal prospecting, the most successful appears to be deep resistivity. These surveys should be designed to obtain information from about 1,000 m, which is a reasonable depth from which to expect production. The number of wells required to explore any one prospect will depend on the number of drilling targets available and the size of these targets, as defined by detailed surveys. The depth of exploratory wells, as their location, must be determined on the basis of the surface surveys. (Knapp-USGS)
W74-11761

GEOPHYSICAL METHODS IN GEOTHERMAL EXPLORATION,
C. J. Banwell.
In: Geothermal Energy--Review of Research and Development (Earth Sciences Series, No 12, p 41-48): United Nations Educational, Scientific and Cultural Organization (UNESCO), Paris, France, 1973. 11 ref.

Descriptors: *Geophysics, *Geothermal studies, *Thermal water, Thermal power, Exploration, Investigations, Mapping, Reviews.
Identifiers: *Geothermal energy.

The presence of a geothermal field will affect or distort some of the local physical quantities, and geophysical aids have proved to be of considerable value in the detection and interpretation of geothermal fields. Geophysical prospecting may be defined as the art of detecting and interpreting anomalies in the local pattern of certain physical quantities, as measured by suitable sensing equipment and techniques. No single method of survey yields a unique and unambiguous result, and the overall picture of a geothermal field and reservoir is built up by a continuous process of cooperative data synthesis and cross-checks. PUBLIC GROUNDWATER SUPPLIES IN CRAWFORD COUNTY,
Illinois State Water Survey, Urbana.
D. M. Woller.
Bulletin 60-7, 1974. 8 p, 14 tab.

Descriptors: *Water supply, *Illinois, *Groundwater resources, *Well data, Aquifer characteristics, Unconsolidated aquifer, Gravels, Sand aquifers, Groundwater, Groundwater availability, Hydrology, Hydrogeology, Water resources, Water quality, Water wells, Municipal water, Water yield, Water properties, Hardness(Water), Chemical properties, Shallow wells.
Identifiers: *Crawford County(IL), Dissolved minerals, Public groundwater supplies, Water bearing formations.

All available data are reported on production wells used for public groundwater supplies in Crawford County, Illinois. The definition of public water supply as contained in the Environmental Protection Act of 1970 was used to determine those water systems and wells to be included. Unconsolidated sand and gravel deposits associated with the valleys of the Wabash River and Brushy Creek are tapped as the sources for three water supply systems. Eight wells with depths ranging from 32 to 85 ft have reported yields from 75 to 800 gpm. Analyses of water indicate the iron content ranges from 0.0 to 1.2 mg/l, and the hardness from 129 to 384 mg/l. (Humphreys-ISWS)
W74-11880

PUBLIC GROUNDWATER SUPPLIES IN BROWN COUNTY,
Illinois State Water Survey, Urbana.
D. M. Woller.
Bulletin 60-5, 1974. 4 p, 5 tab.

Descriptors: *Water supply, *Illinois, *Groundwater resources, *Well data, Aquifer characteristics, Unconsolidated aquifer, Gravels, Sand aquifers, Groundwater, Groundwater availability, Hydrology, Hydrogeology, Water resources, Water quality, Water wells, Municipal water, Water yield, Water properties, Hardness(Water), Chemical properties, Shallow wells, Deep wells.
Identifiers: *Brown County(IL), Dissolved minerals, Public groundwater supplies, Water bearing formations.

All available data are reported on production wells used for public groundwater supplies in Bown County, Illinois. The definition of public water supply as contained in the Environmental Protection Act of 1970 was used to determine those water systems and wells to be included. Unconsolidated sand and gravel deposits associated with a narrow bedrock valley tributary to the Illinois River valley are tapped as a source of a municipal water supply. Two wells ranging in depth from 36 to 45 ft have reported yields from 18 to 20 gpm. Their iron content ranges from 0.0 to 0.1 mg/l and the hardness from 397 to 500 mg/l. Consolidated bedrock aquifers, principally the Keokuk-Burlington limestone, are tapped as a source of both private and municipal supplies. One well is 483 ft deep and yields 33 gpm. The iron content ranges from 0.0 to 0.2 mg/l and the hardness from 26 to 40 mg/l. (Humphreys-ISWS)
W74-11881

PUBLIC GROUNDWATER SUPPLIES IN BOONE COUNTY,
Illinois State Water Survey, Urbana.
D. M. Woller, and E. W. Sanderson.
Bulletin 60-6, 1974. 12 p, 2 fig, 13 tab.

Descriptors: *Water supply, *Illinois, *Groundwater resources, *Well data, Aquifer characteristics, Unconsolidated aquifer, Gravels, Sand aquifers, Groundwater, Groundwater availability, Hydrology, Hydrogeology, Water resources, Water quality, Water wells, Municipal water, Water yield, Water properties, Hardness(Water), Chemical properties, Deep wells, Shallow wells.
Identifiers: *Boone County(IL), Dissolved minerals, Public groundwater supplies, Water bearing formations.

All available data are reported on production wells used for public groundwater supplies in Boone County, Illinois. The definition of public water supply as contained in the Environmental Protection Act of 1970 was used to determine those water systems and wells to be included. Unconsolidated sand and gravel deposits are tapped with three wells for municipal water supplies. These wells with depths ranging from 120 to 184 ft have reported yields from 150 to 1,935 gpm. Analyses of water from these wells indicate that the iron content ranges from 0.0 to 0.5 mg/l and the hardness from 292 to 352 mg/l. The underlying bedrock units are also tapped for water supplies. These wells with depths ranging from 610 to 1,861 ft have reported yields from 400 to 1,580 gpm. Analyses of water indicate the iron content ranges from 0.0 to 3.0 mg/l and the hardness from 308 to 588 mg/l. (Humphreys-ISWS)
W74-11882

PUBLIC GROUNDWATER SUPPLIES IN FORD COUNTY,
Illinois State Water Survey, Urbana.
D. M. Woller.
Bulletin 60-8, 1974. 19 p, 33 tab.

Descriptors: *Water supply, *Illinois, *Groundwater resources, *Well data, *Aquifer characteristics, Unconsolidated aquifer, Gravels, Sand aquifers, Groundwater, Groundwater availability, Hydrology, Hydrogeology, Water resources, Water quality, Water wells, Municipal water, Water yield, Water properties, Hardness(Water), Chemical properties, Deep wells, Shallow wells.
Identifiers: *Ford County(IL), Dissolved minerals, Public groundwater supplies.

All available data are reported on production wells used for public groundwater supplies in Ford County, Illinois. The definition of public water supply as contained in the Environmental Protection Act of 1970 was used to determine those water systems and wells to be included. Sand and gravel deposits in the unconsolidated materials above bedrock are tapped as the sources for eight municipal water supplies. Seventeen municipal production and standby wells, ranging in depth from 56 to 340 ft, have reported yields from 74 to 1900 gpm. Analyses of water they produce indicate the iron content ranges from 0.0 to 8.6 mg/l and the hardness from 194 to 785 mg/l. A consolidated bedrock aquifer, principally the Silurian dolomite, is tapped as the primary source for one municipal supply. The three wells, 233 and 357 ft deep, reported yields from 19 to 133 gpm. Analyses of water from these wells indicate the iron content ranges from 0.2 to 1.6 mg/l and the hardness from 544 to 820 mg/l. A description for each production well includes the aquifer tapped, date drilled, depth, driller, legal location, elevation in feet above mean sea level, log, construction features, yield, pumping equipment, and chemical analyses. (Humphreys-ISWS)

PUBLIC GROUNDWATER SUPPLIES IN HARDIN COUNTY,
Illinois State Water Survey, Urbana.
D. M. Woller.
Bulletin 60-10, 1974. 4 p, 5 tab.

Descriptors: *Water supply, *Illinois, *Groundwater resources, *Well data, *Aquifer characteristics, Unconsolidated aquifers, Gravels, Sand aquifers, Groundwater, Groundwater availability, Hydrology, Hydrogeology, Water resources, Water quality, Water wells, Municipal water, Water yield, Water properties, Hardness(Water), Chemical properties, Shallow wells.

Identifiers: *Hardin County(IL), Dissolved minerals, Public groundwater supplies, Water bearing formations.

All available data are reported on production wells used for public groundwater supplies in Hardin County, Illinois. The definition of public water supply as contained in the Environmental Protection Act of 1970 was used to determine those water systems and wells to be included. Unconsolidated sand and gravel deposits associated with the bottomlands of the Ohio River valley are tapped as a source of municipal water supply for the Hardin County Water District. The well is 84.5 ft deep and its reported yield was 65 gpm upon completion. Analyses of water from the well indicate the iron content ranges from 1.6 to 3.1 mg/l and the hardness from 344 to 382 mg/l. A consolidated bedrock aquifer, Mississippian age creviced limestone, was tapped as the primary source of municipal supply for the village of Cave in Rock. The well is 215 ft deep and its reported yield ranges from 92 to 105 gpm. Analyses of water from this well indicate that the iron content ranges from 0.15 to 0.2 mg/l and the hardness from 270 to 307 mg/l. A description for each well includes the aquifer tapped, date drilled, depth, driller, legal location, elevation in feet above mean sea level, log, construction features, yield, pumping equipment, and chemical analyses. (Humphreys-ISWS)
W74-11884

PUBLIC GROUNDWATER SUPPLIES IN KENDALL COUNTY,
Illinois State Water Survey, Urbana.
D. M. Woller, and J. P. Gibb.
Bulletin 60-4, 1974. 16 p, 2 fig, 29 tab.

Descriptors: *Water supply, *Illinois, *Groundwater resources, *Well data, Aquifer characteristics, Unconsolidated aquifer, Gravels, Sand aquifers, Groundwater, Groundwater availability, Hydrology, Hydrogeology, Water resources, Water quality, Water wells, Municipal water, Water yield, Water properties, Hardness(Water), Chemical properties, Shallow wells, Deep wells.
Identifiers: *Kendall County(IL), Dissolved minerals, Public groundwater supplies, Water bearing formations.

All available data are reported on production wells used for public groundwater supplies in Kendall County, Illinois. The definition of public water supply as contained in the Environmental Protection Act of 1970 was used to determine those water systems and wells to be included. Unconsolidated sand and gravel associated with shallow local deposits are tapped for municipal water supplies. Six wells with depths from 18 to 42 ft had reported yields from 150 to 430 gpm. Analyses of water from these wells indicate the iron content ranges from a trace to 0.7 mg/l and the hardness from 339 to 425 mg/l. The underlying bedrock units are tapped with 12 wells for six water supplies. These wells with depths ranging from 120 to 1,396 ft deep have reported yields from 10 to 1,280 gpm. Analyses of water from these wells indicate the iron content ranges from 0.0 to 2.6 mg/l and the hardness from 224 to 357 mg/l. (Humphreys-ISWS)
W74-11885

PUBLIC GROUNDWATER SUPPLIES IN EDGAR COUNTY,
Illinois State Water Survey, Urbana.
D. M. Woller.
Bulletin 60-9, 1974. 10 p, 19 tab.

Descriptors: *Water supply, *Illinois, *Groundwater resources, *Well data, *Aquifer characteristics, Unconsolidated aquifer, Gravels, Sand aquifers, Groundwater, Groundwater availability, Hydrology, Hydrogeology, Water resources, Water quality, Water wells, Municipal water, Water yield, Water properties, Hardness(Water), Chemical properties, Shallow wells.
Identifiers: *Edgar County(IL), Dissolved minerals, Public groundwater supplies.

All available data are reported on production wells used for public groundwater supplies in Edgar County, Illinois. The definition of public water supply as contained in the Environmental protection Act of 1970 was used to determine those water systems and wells to be included. Sand and gravel deposits in the unconsolidated materials above bedrock are tapped as the sources for seven municipal water supplies. Fourteen municipal production and standby wells with depths ranging from 38 to 165 ft have reported yields with from 23 to 348 gpm. Analyses of water they produce indicate that the iron content ranges from 0.0 to 8.2 mg/l and the hardness from 236 to 396 mg/l. The upper-bedrock units of Pennsylvanian age are tapped by one well 165 ft deep. No yield data are available. An analysis of water from this well indicated that the iron content is 2.5 mg/l and the hardness is 271 mg/l. A description for each well includes the aquifer tapped, date drilled, depth, driller, legal location, elevation in feet above mean sea level, log, construction features, yield, pumping equipment, and chemical analyses. (Humphreys-ISWS)
W74-11886

PUBLIC GROUNDWATER SUPPLIES IN ALEXANDER COUNTY,
Illinois State Water Survey, Urbana.
D. M. Woller.
Bulletin 60-2, 1973. 4 p, 6 tab.

Descriptors: *Water supply, *Illinois, *Groundwater resources, *Well data, Aquifer characteristics, Unconsolidated aquifer, Gravels, Sand aquifers, Groundwater, Groundwater availability, Hydrology, Hydrogeology, Water resources, Water quality, Water wells, Municipal water, Water yield, Water properties, Hardness(Water), Chemical properties, Shallow wells, Deep wells.
Identifiers: *Alexander County(IL), Dissolved minerals, Public groundwater supplies, Water bearing formations.

All available data are reported on production wells used for public groundwater supplies in Alexander County, Illinois. The definition of public water supply as contained in the Environmental Protection Act of 1970 was used to determine those water systems and wells to be included. Unconsolidated sand and gravel deposits associated with the bottomlands of the Mississippi and Cache River Valleys are tapped as sources of municipal water supplies. Two wells, 108 and 171 ft deep, have reported yields greater than 100 gpm. Analyses of water from these wells indicate the iron content ranges from 0.7 to 8.0 mg/l and the hardness from 371 to 420 mg/l. A consolidated bedrock aquifer, creviced limestone, is tapped as the primary source for one municipal supply. The well is 300 ft deep and is pumped at 100 gpm. The iron content of water from this well ranges from 0.0 to 0.4 mg/l and the hardness from 308 to 352 mg/l. (Humphreys-ISWS)

GEOLOGY AND GROUNDWATER FOR LAND-USE PLANNING IN THE EAGLE RIVER-CHUGIAK AREA, ALASKA,
Geological Survey, Anchorage, Alaska.
C. Zenone, H. R. Schmoll, and E. Dobrovolny.
Open-file Report 74-57, 1974. 25 p, 9 fig, 1 plate, 4 tab, 15 ref, append.

Descriptors: *Hydrogeology, *Water resources, *Alaska, Groundwater, Alluvium, Aquifers, Water yield, Data collections, Hydrologic data, Geologic mapping, Water demand.
Identifiers: *Anchorage(AK).

The geology and groundwater resources of the Eagle River-Chugiak area, Alaska, are described. The study area lies mostly within the Cook Inlet-Susitna Lowland and consists of low hills and intervening channels, hummocky ridges, sloping alluvial fans, and low-lying tidal flats that border Knik Arm. The eastern part of the area lies on the steep slopes of the Chugach Mountains. Drainage is generally to the west and northwest, except that locally the slopes drain southwesterly to the Eagle River, the major stream of the area. Limited amounts of groundwater can be recovered from the bedrock in the Eagle River-Chugiak area, particularly where the rock is fractured and weathered. Greater success in locating larger amounts of groundwater can be expected in the more permeable and more porous unconsolidated surficial deposits. The types of geologic materials from which groundwater can be recovered in adequate quantities for even single-family use are limited in number and areal extent. However, two alluvial-fan areas--at Meadow Creek and at Peters Creek--are potential sources for larger, communitywide water supplies. A yield of 326 gpm was reported for one well on the Meadow Creek fan. The chemical quality of groundwater in the Eagle River-Chugiak area is acceptable for domestic use. A potential for bacteriological pollution of the water exists, however, in relatively high-density residential area of Eagle River, where individual shallow wells and septic tanks are used. Part of the community is now served by a sewage-collection system and treatment facility. (Knapp-USGS)

GROUNDWATER AND GEOLOGY OF BARAGA COUNTY, MICHIGAN,
Geological Survey, Lansing, Mich.
C. J. Doonan, and J. R. Byerlay.
Michigan Geological Survey Water Investigation 11, 1973. 26 p, 2 fig, 2 plate, 8 tab, 12 ref.

Descriptors: *Groundwater, *Water resources, *Michigan, Hydrogeology, Data collections, Hydrologic data, Municipal water, Domestic water, Water yield, Water quality.
Identifiers: *Baraga County(MI).

Most wells in Baraga County, Michigan, obtain water from beds of sand and gravel in morainal and lakebed deposits or from the Jacobsville Sandstone. Yields of wells range from a few gpm to as much as 115 gpm, but most wells probably yield less than 10 gpm. Large areas where igneous and metamorphic rocks crop out or are covered only by thin drift are unfavorable for obtaining enough groundwater for even a domestic supply. Quality of water from most wells is satisfactory, although most water supplies are hard and some are high in iron content. Some of the deeper wells in the Jacobsville Sandstone may yield salty water. Most large public water supplies are obtained from Lake Superior, but some smaller supplies are obtained from wells and springs. (Knapp-USGS)
W74-11987

HYDROLOGY OF THE COLUMBIA (PLEISTOCENE) DEPOSITS OF DELAWARE: AN APPRAISAL OF A REGIONAL WATER-TABLE AQUIFER,
Geological Survey, Dover, Del.
R. H. Johnston.
Delaware Geological Survey Bulletin No 14, June 1973. 78 p, 15 fig, 7 tab, 46 ref.

Descriptors: *Hydrogeology, *Aquifers, *Delaware, Water yield, Transmissivity, Data collections, *Hydrologic data, Surface-groundwater relationships, Aquifer characteristics, Coastal plains.
Identifiers: *Columbia Aquifer(DE).

The Columbia (Pleistocene) deposits of Delaware form a regional water-table aquifer, which supplies about half the groundwater pumped in the State. The aquifer is composed principally of sands which occur as channel fillings in northern Delaware and as a broad sheet across central and southern Delaware. The saturated thickness of the aquifer ranges from a few feet in many parts of northern Delaware to more than 180 feet in southern Delaware. The average transmissivity in central and southern Delaware is about 7,000 sq ft/day, and the average hydraulic conductivity is about 90 ft/day. Six areas of above-average transmissivity have been identified in central and southern Delaware, where transmissivity ranges from 10,000 sq ft/day to 22,000 sq ft/day. The small Coastal Plain streams of central and southern Delaware are incised into the upper part of the Columbia deposits and derive about three-quarters of their flow from groundwater discharge. Present pumpage (33 mgd) is small compared to the natural discharge from the aquifer. The specific capacity of large-diameter wells ranges from about 5 to 100 gpm/ft and averages 28 gpm/ft. Water from the Columbia deposits is generally soft, slightly acidic, and characterized by low dissolved-solid content. (Knapp-USGS)
W74-11993

GROUNDWATER RESOURCES OF BRAZOS AND BURLESON COUNTIES, TEXAS,
Geological Survey, Austin, Tex.
C. R. Follett.
Texas Water Development Board Report 185, June 1974. 194 p, 27 fig, 17 tab, 34 ref.

Descriptors: *Water resources, *Groundwater, *Aquifers, *Texas, *Data collections, Hydrologic data, Hydrogeology, Water yield, Water quality, Water wells.
Identifiers: *Brazos County(TX), *Burleson County(TX).

The geologic formations that yield large quantities of water to wells in Brazos and Burleson Counties, Texas are the Wilcox Group, Carrizo Sand, Queen City Sand, Sparta Sand, terrace deposits, and flood-plain alluvium. The Carrizo Sand and the underlying Wilcox Group are in hydraulic continuity and function as a single aquifer. About 34 mgd of groundwater was used for all purposes in 1969. Of this amount, 66% was used for irrigation, 32% for public supply, and 2% for industrial, rural-domestic, and livestock needs. Use of groundwater for public supply increased from a total of 1.3 mgd in 1940 to 11 mgd in 1969. Large quantities of groundwater are available for development. About 290 million acre-feet of fresh to slightly saline water is in transient storage in the principal upland aquifers and flood-plain alluvium. About 220 million acre-feet is stored in the Carrizo-Wilcox aquifer. The total quantity of water available from the principal aquifers without depleting the supply is about 64,000 acre-feet per year or 57 mgd. The Carrizo-Wilcox aquifer, Queen City Sand, and Sparta Sand contain water that is generally suitable for public supply, many industrial uses, and irrigation. (Knapp-USGS)

APPLICATION OF SURFACE GEOPHYSICS TO GROUNDWATER INVESTIGATIONS,
Geological Survey, Washington, D.C.
A. A. R. Zohdy, G. P. Eaton, and D. R. Mabey.
Available from GPO, Washington, DC 20402, Price $1.90 (paper copy). Techniques of Water-Resources Investigations, Book 2, Chapter D1, 1974. 116 p, 76 fig, 156 ref.

Descriptors: *Geophysics, *Electrical studies, *Gravity studies, *Magnetic studies, *Seismic studies, Subsurface investigations, Hydrogeology, Exploration, Subsurface mapping, Surveys, Instrumentation, Equipment.

This manual reviews the standard methods of surface geophysics applicable to groundwater investigations. It covers electrical methods, seismic and gravity methods, and magnetic methods. The general physical principles underlying each method and its capabilities and limitations are described. Possibilities for nonuniqueness of interpretation of geophysical results are noted. Examples of actual use of the methods are given to illustrate applications and interpretation in selected geohydrologic environments. The objective of the manual is to provide the hydrogeologist with a sufficient understanding of the capabilities, limitations, and relative cost of geophysical methods to make sound decisions as to when use of these methods is desirable. The manual also provides enough information for the hydrogeologist to work with a geophysicist in designing geophysical surveys that differentiate significant hydrogeologic changes. (Knapp-USGS)

EXTENT AND DEVELOPMENT OF URBAN FLOOD PLAINS,
Geological Survey, Reston, Va.
W. J. Schneider, and J. E. Goddard.
Circular 601-J, 1974. 14 p, 8 fig, 3 tab, 1 ref. OWRR C-4048 (9009) (22).

Descriptors: *Flood plains, *Urbanization, *Floods, Urban hydrology, Flood profiles, Flood stages.
Identifiers: Urban flood plains.

The amount of urban area in flood plains of 26 urbanized areas in the United States ranges from 2.4% for Spokane, Wash., to 81% for Monroe, La. The median value is 10.5%, and the weighted average is 16.2%. The amount of development on these flood plains also varies widely, from 11.3% for Lorain-Elyria, Ohio, to 97% for Great Falls, Mont. The median value is 57%, and the weighted average is 52.8%. Attempts to correlate either the extent of urban area in flood plain or amount of development with three readily available indices--depth of flooding, precipitation, and physiography--showed no strong relationships. Some correlation was found between the extent of urban area in flood plain and index of depth of flooding. (Knapp-USGS)

CHARACTER AND SIGNIFICANCE OF HIGHWAY RUNOFF WATERS--A PRELIMINARY APPRAISAL,
Washington Univ., Seattle. Dept. of Civil Engineering.
R. O. Sylvester, and F. B. DeWalle.
Available from NTIS, Springfield, Va. 22161 as PB-220 083 Price $5.45 printed copy; $2.25 microfiche. Final Contract Report for Washington Department of Highways and Federal Highway Administration, December 1972. 97 p, 14 fig, 28 tab, 82 ref, 3 append.

Descriptors: *Water quality, *Washington, *Roads, *Storm runoff, Urban hydrology, Water pollution sources, Highway effects, Path of pollutants, Heavy metals, Oily water, Highways.
Identifiers: Seattle(WA).

The character and significance of highway runoff were studied in Washington. Literature was reviewed and observations were made on a limited amount of field sampling done on the runoff and particulate emissions from the State Highway 520 bridge over Portage Bay in Seattle. While highway runoff contains significant quantities of oils, heavy metals, dust and dirt, substances from vehicle wear, litter, and algal nutrients, it does not appear to be very much different in general quality from urban area runoff. Preliminary results indicate that heavy metal concentrations may be higher in highway runoff. A major portion of vehicle emissions are apparently carried off the road surface by air currents and by splashing. The large sized particulates settle close to the road surface. If they settle on a soil surface, it is likely that most of them are retained in the soil and do not appear in the right-of-way runoff. A significant portion of the oils, heavy metals and nutrients are absorbed to particulates and other solids. Deicing salts should have no significant effect on either Lake Washington or Echo Lake and bridge runoff into Lake Washington is insignificant as compared to urban area drainage to the Lake. PROCEEDINGS: PLANNING AND DESIGN FOR URBAN RUNOFF AND SEDIMENT MANAGEMENT.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-225 274, $4.00 in paper copy, $2.25 in microfiche. A Two Day Short Course. April 10-11, 1973. University of Kentucky, Lexington. Edited by C. T. Haan and B. J. Barfield, University of Kentucky, Lexington, UKY-TR72-73-CEEDS, July, 1973. 29 p, 5 fig, 3 tab, 11 ref.

Descriptors: *Sediment control, *Planning, *Runoff, Channel erosion, Sediment-water interfaces, Soil erosion, Construction, Urbanization, Surface runoff, Drainage systems, Drainage.
Identifiers: Impact zoning, *Impact of construction process, HUD guidelines.

The development of agricultural, forest, or idle land for urban needs greatly increases quantities of runoff and frequency of flooding. These increased runoff flows exceed the capacity of existing channels not only to carry the water, but to resist the erosive power of the water, resulting in stream channel erosion. During the construction phase of development, the sediment production from an area can increase by more than 100 percent. The five papers contained in this proceedings discuss available techniques for reducing these problems, including the utility of impact zoning, HUD runoff and sediment management control guidelines, basic storm drainage system design, urban storm runoff controls, and sediment control principles and methods. The papers are all directed toward preventive methods of urban runoff and sedimentation in areas undergoing development, rather than corrective procedures for already urbanized areas. During the period of this demonstration, a natural and agricultural region is being converted to an urban community. This project consists of (1) the implementation, demonstration, and evaluation of erosion control practices; (2) the construction, operation, and demonstration of the use of a stormwater retention pond for the control of stormwater pollution; and (3) the construction, operation, and maintenance of methods for handling, drying, conditioning, and disposing of sediment. In addition, a gaging and sampling program was conducted to determine the effects of urbanization on the hydrology and water quality of natural areas. This project was conducted in the Village of Long Reach, Columbia, Maryland. (EPA)

MERCURY IN STRIPED BASS AND BLUEFISH,
New York Ocean Science Lab., Montauk.
J. E. Alexander, J. Foehrenbach, S. Fisher, and D. Sullivan.
New York Fish and Game Journal, Vol 20, No 2, p 147-151, 1973. 3 fig, 8 ref.

Descriptors: *Mercury, *Striped basses, Absorption, Age, Analytical techniques, Bioassay, Methodology, Spectrophotometry, Heavy metals, Water pollution effects, *Pollutant identification, *New York.
Identifiers: *Bluefish, Montauk Point(New York), Morone saxatilis, Pomatomus saltatrix, Methyl mercury, Long Island.

Bluefish and striped bass taken in the vicinity of Montauk Point on Long Island were analyzed for mercury content. In both species, there was a correlation between mercury and weight. Bluefish weighing less than 2.4 kg had concentrations of mercury below 0.5 mg/kg, while in those between 2.4 and 5.6 kg the concentrations fluctuated above and below that level. All fish weighing more than 5.6 kg contained mercury in excess of 0.5 mg/kg. The corresponding weight categories for striped bass were less than 3.2 kg; between 3.2 and 5.7 kg, and more than 5.7 kg, respectively. (Katz)

DETERMINATION OF THE BOD5 IN RUNNING WATERS BY MEANS OF BIOLOGICAL WATER ANALYSIS,
Rheinland-Pfalz, Hydrological Service, Mainz (West Germany).
E. Hantge.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 582-587, 1973. 5 ref.

Descriptors: *Biochemical oxygen demand, *Monitoring, *Water analysis, Water pollution control, Bioindicators, Water quality control, International hydrological decade, Pollutant identification.
Identifiers: *Germany.

Control of the discharge of organic oxygen-consuming substances into the rivers and canals of Germany is one of the main problems in keeping these waters clear. The method of determining the BOD content from the biological state allows the amount of pollution to be determined. In controlling the waters of Rheinland-Pfalz, the usefulness of this method has been proved repeatedly. In some cases it was found that the quantity of pollution in a river or canal, measured as BOD content, could only be decided from determination of the biological state, and these measurements were em-

ployed for management decisions. Examples are quoted from the practice of the Rheinland-Pfalz water supply system. (See also W74-11493) (Knapp-USGS)

THE COLORIMETRIC FRONT-END SENSORS IN AUTOMATIC SURVEILLANCE OF WATER QUALITY,
Automated Environmental Systems, Inc., Woodbury, N.Y.
S. M. Zand.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 608-612, 1973. 1 fig, 1 ref.

Descriptors: *Monitoring, *Water quality, *Automation, *Colorimetry, Chemical analysis, Water analysis, Instrumentation, Data collections, Sampling, International hydrological decade, Pollutant identification.

Instrumentation systems used for continuous, unattended, surveillance of water quality consist of front-end sensores, signal conditioners, data transmitters, data storage and retrieval components, and data conditioners. The characteristics of the front-end sensors may also require sample conditioners. The front-end sensors and sample conditioners are often the weakest components of the overall instrumentation system. The lack of compatible front-end sensors is more pronounced when data are utilized in system automation or process control. Colorimetric modules are reliable and are the recommended type of sensor. For the optimum performance of the continuous, unattended colorimetric module in many applications an equally automatic filtration system is a necessity. Techniques are suggested for obtaining over-all system compatibility. (See also W74-11493) (Knapp-USGS)

SIMPLIFIED ATOMIC ABSORPTION DETERMINATION OF STABLE STRONTIUM IN MILK AND HAY: A COMPARISON OF METHODS AND STEPWISE PROCEDURE,
Environmental Protection Agency, Las Vegas, Nev. Monitoring Systems Research and Development Lab.
J. Barth, and B. H. Bruckner.
Available from Government Printing Office, Washington, D.C., $0.70/copy. Report No EPA-680/4-73-002, February 1974. 30 p, 1 fig, 6 tab, 6 ref, append.

Descriptors: *Strontium, *Radioactivity, Monitoring, Assessment, *Assay, Absorption, *Milk, *Hay, Alfalfa, Stable isotopes, Research and development, Analytical techniques, Chemical analysis, *Testing procedures, *Pollutant identification.
Identifiers: Quantitative analysis.

An evaluation is presented of a highly simplified atomic absorption procedure for the determination of stable strontium in fluid milk, milk powder, and alfalfa. A statistical comparison is made between the atomic absorption method of additions and the standard curve method. A difference between the methods was not detected. A suggested stepwise procedure is given. (Houser-ORNL)

CHLORINATION EXPERIMENTS AT THE JOHN E. AMOS PLANT OF THE APPALACHIAN POWER COMPANY: APRIL 9-10, 1973,
Argonne National Lab., Ill.
J. E. Draley.
Available from NTIS, Springfield, Va 22161 as ANL/ES-23., $4.00 paper copy, $2.25 in microfiche. Report No ANL-ES-23, June 1973. 26 p, 3 fig, 4 tab, 3 ref.

Descriptors: *Chlorine, Environment, *Nuclear powerplant, *Cooling towers, *Cooling water, Water pollution, Water pollution sources, Chlorides, Chlorination, Model testing, Assay, Assessment, *Pollutant identification, *Thermal pollution.

In two special runs, free and total residual chlorine were measured in the circulating-water system of the cooling tower for the Amos Plant Unit 1. For a typical chlorination period, in which the concentration of free chlorine at the condenser was about 0.1 ppm, the total residual-chlorine concentration reached maxima of 0.63 ppm at the condenser discharge and 0.32 ppm in the discharge from the cooling-tower basin. These residual-chlorine levels declined after the addition of chlorine was stopped, but more than 2 hr elapsed before the residual chlorine could no longer be detected by the amperometric-titration method. The data for the buildup of residual chlorine at the condenser were fitted with a kinetic expression in which some reduction of chlorine to chloride and some formation of chloramines are assumed. Good fits, with reasonable values of the constants, suggest that the model is correct. Good fits are also reported for an equation to determine decay of combined chlorine. (Houser-ORNL)

THE TRACE ANALYSIS OF WATER FOR SELECTED METALLIC ELEMENTS EMPLOYING SQUAREeWAVE POLAROGRAPHY,
Georgia Inst. of Tech., Atlanta. School of Chemistry.
P. E. Sturrock, and R. J. Carter.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 406, $4.75 in paper copy, $2.25 in microfiche. Georgia Environmental Resources Center, Atlanta, Report No ERC-0874, July 1974. 130 p, 11 fig, 5 tab, 101 ref. OWRR B-063-GA(1). 14-31-0001-3571.

Descriptors: *Water pollution, *Heavy metals, *Analytic techniques, *Polarographic analysis, Electrodes, Copper, Cadmium, Zinc, Lead, Manganese, Nickel, Iron, Cobalt, *Pollutant identification.
Identifiers: Square-wave polarography, Antimony, Arsenic, Tin, Thallium, Bismuth.

A highly sensitive technique was developed to detect heavy metal pollutants at a cost comparable to that of atomic absorption spectroscopy. The instrument is based on the technique of square-wave polarography and uses a dropping mercury electrode (DME). The limits of detection (as parts per billion) for thirteen elements are: Cu(II), 0.6; Cd(II), 0.6; Zn(II), 0.6; Pb(II), 0.8; Sb(III), 3.7; As(III), 3.7; Mn(II), 4.4; Ni(II), 4.7; Sn(IV), 4.8; Fe(III), 5.6; Tl(I), 6.1; Co(II), 19; Bi(III), 21. In all cases, peak height was a linear function of concentration. The chief disadvantages of the DME are the slow sweep rate required (1-5 mv/sec) and the fact that, in these low concentrations, metal ions are rapidly adsorbed onto glass walls. The use of the hanging mercury drop and the thin mercury film disk electrodes for the analysis of very low concentrations of metals was also investigated. The mercury film rotating disk electrode allowed more rapid, sensitive, and reproducible determinations than did the hanging mercury drop electrode. The procedure employed for detection of low concentrations of metals with the disk electrode required careful control of all instrumental and chemical parameters. In less than 15 minutes analysis time, concentrations below 10-9F could be determined for metals amenable to stripping analysis. Results are reported for the analysis of EPA water reference standards employing the rotating disk and dropping mercury electrodes. The instrumentation and techniques developed are expected to be of considerable value in the analysis of water for heavy metals. The limits of detection are quite low, and the equipment cost is about $3000. (James-Georgia Tech)
W74-11679

ATOMIC ABSORPTION DETERMINATION OF ELEMENTAL MERCURY COLLECTED FROM AMBIENT AIR ON SILVER WOOL,
Environmental Protection Agency, Research Triangle Park, N.C. Quality Assurance and Environmental Monitoring Lab.
S. J. Long, D. R. Scott, and R. J. Thompson.
Analytical Chemistry, Vol 45, No 13, p 2227-2233, November, 1973. 8 tab, 4 fig, 21 ref.

Descriptors: *Mercury, *Analytical techniques, *Air pollution, Testing procedures, Laboratory tests, Absorption, *Heavy metals, *Pollutant identification.
Identifiers: *Atomic absorption spectroscopy, Silver wool, Detection limit, Vapor densities.

A flameless atomic absorption system is described to analyze ambient mercury levels from 15 ng/cu m to 10 micro gram/cu m by use of in-series silver wool collectors for 24-hour sampling times. Absorption-time area measurements gave better precision at higher mercury concentrations and calibration curves extending over wider ranges than did absorption-peak height measurements. The mercury vapor calibration curves extend from 0.5 ng to 594 ng mercury and were reproducible to within 11% at 0.5 ng and to within 3%, relative standard deviation, beyond 6 ng. Detection limit was 0.3 ng. The effects of analytical train flow rate, the capacity of the silver wool collectors, and the release temperature for collected mercury were investigated. Ambient levels of dimethylmercury, sulfur dioxide, hydrogen sulfide, and nitrogen dioxide did not seriously interfere with the collection or analysis procedures. (Jernigan-Vanderbilt)
W74-11705

MERCURY CONCENTRATIONS IN FISH, PLANKTON, AND WATER FROM THREE WESTERN ATLANTIC ESTUARIES,
Long Island Univ., Greenvale, N.Y. Graduate Dept. of Marine Science.
G. Cocoros, P. H. Cahn, and W. Siler.
Journal of Fish Biology, Vol 5, p 641-647, 1973. 5 tab, 18 ref.

Descriptors: Fish, Plankton, *Mercury, *Estuaries, *North Carolina, *Maryland, *New York, Distribution, Spectroscopy, *Pollutant identification.
Identifiers: Public health, Atomic absorption spectroscopy.

Twenty fish samples, plankton, and water were obtained from three Western Atlantic estuaries located off the coasts of North Carolina, Maryland, and New York. All fish samples were collected at high tide, at approximately 25C and 31 ppt salinity. Plankton and water samples were taken concurrently at each sample site. Total mercury concentrations were determined by flameless atomic absorption. No dangerously high mercury levels were found in any of the samples. Although there was some indication that the food chain is a likely source of mercury contamination in these fish, since levels in viscera were very much higher than those in the rest of the fish, no evidence of strong food-chain intensification was found. Slow mercury accumulation by the fish was evident. Accumulation of mercury by the fish took place through the digestive system. Fish mercury levels were twice that for the plankton. Phytoplankton had higher mercury levels than zooplankton. (Rowe-Vanderbilt)
W74-11715

AEROSOLS OF LEAD, NICKEL, AND CADMIUM,
Cincinnati Univ., Ohio. Kettering Lab.
S. Horstman, W. Barkley, E. Larson, and E. Bingham.
Archives of Environmental Health, Vol 26, p 75-77, February, 1973. 3 fig, 1 tab, 8 ref. 1-ROI.EC.00385-02.

Descriptors: *Lead, *Cadmium, *Nickel, *Aerosols, Technology, Application methods, Oxidation, Spectrometry, Distribution, *Pollutant identification.
Identifiers: Atomic absorption spectroscopy, Electron photomicrograph.

An aerosol generator for the production of soluble and insoluble nickel, lead, and cadmium aerosols was developed. Solutions of lead chloride or nickel chloride were used to make water soluble aerosols. Aerosols of insoluble nickel oxide and cadmium oxide were produced by aerosolizing aqueous solutions of nickel citrate or cadmium acetate with air and then thermally decomposing the resulting aerosol in a tube furnace heated to 600C. The use of a nebulizer with soluble salts of metals followed by thermal decomposition and oxidation to form the required oxide provided a simple easily controlled and flexible system for the generation of aerosols of metal oxides. These aerosols can be used in the investigation of biological effects of inhalation of metal compounds when certain size and certain concentrations of the aerosol particles are needed. (Rowe-Vanderbilt)
W74-11716

MERCURY CONTENT OF OREGON GROUNDFISH,
Oregon State Univ., Astoria. Dept. of Food Science and Technology.
E. A. Childs, and J. N. Gaffke.
Fishery Bulletin, Vol 71, No 3, p 713-717, July, 1973. 4 fig, 3 tab, 7 ref. NOAA-73110601-9. NOAA-043-158-4.

Descriptors: *Fish, *Mercury, *Oregon, *Spectroscopy, Water pollution, Wastes, Regression analysis, Marine fisheries, Distribution, *Pollutant identification.
Identifiers: Atomic absorption spectroscopy, *Groundfish.

Groundfish were obtained from each of the three major fishing areas off the Oregon Coast. Specimens were immediately dissected, packed in evacuated film, and held at minus 40C until mercury analyses were performed. The amount of mercury in each sample was determined by flameless atomic absorption spectroscopy. Specimens with a mean mercury content less than 0.50 ppm mercury included the rex sole, Dover sole, petrale sole, English sole, sand sole, starry flounder, canary rockfish, flag rockfish, yellowtail rockfish, rougheye rockfish, sablefish, lingcod, Pacific hake and the arrowtooth flounder. Only the mercury content of the spiny dogfish was greater than or equal to 0.50 ppm mercury. No significant relationship was observed between catch location, time of catch, weight and length of specimen, or sex and mercury content found in specimens tested. (Rowe-Vanderbilt)

U.S. GEOLOGICAL SURVEY WATER QUALITY PROGRAM, INDIANA DISTRICT,
Geological Survey, Indianapolis, Ind.
W. J. Shampine.
Open-file report, 1974. 26 p, 4 tab, 21 ref.

Descriptors: *Water quality, *Data collections, *Water analysis, *Indiana, Chemical analysis, Solutes, *Pollutant identification, Water pollution effects.

The capabilities of the Indiana district of the U.S. Geological Survey in the field of water-quality investigations are described. The U. S. Geological Survey conducts investigations in cooperation with various Federal, State, or local agencies to define and describe the hydrologic resources of an area. The program at a given time consists of long-term basic-data collection and relatively short-term studies of specific problems or areas. The Survey is currently making three water-quality-oriented interpretive studies. One study, in cooperation with the National Park Service, is

designed to describe the current quality of the water in the newly established Indiana Dunes National Lakeshore between Michigan City and Gary, Indiana. The second study, in cooperation with the city of Indianapolis, is designed to describe the movement and quality of the groundwater near the seven sanitary landfills around Indianapolis. The third study, being done in cooperation with the Soil Conservation Service, is designed to describe the water-quality characteristics of selected areas where the Soil Conservation Service has instigated a watershed management program. WASTEWATER SAMPLING AND TESTING INSTRUMENTATION,
Georgia Inst. of Tech., Atlanta.
T. F. Craft, and R. S. Ingols.
Available from NTIS, Springfield, Va 22161 as AD-764 689, Price $3.50 printed copy; $2.25 microfiche. Air Force Weapons Laboratory Kirtland AFB, New Mexico, Technical Report No 73-69, July 1973. 62 p, 9 fig, 1 tab, append. AF Contract F29601-72-C-0149.

Descriptors: *Sampling, *Monitoring, *Waste water(Pollution), *Surveys, Reviews, Equipment, Water analysis, Waste water treatment, Sewage treatment, Military reservations, *Pollutant identification.

Commercially available wastewater sampling and monitoring equipment was surveyed. Information was gathered from vendors and directly from users by a questionnaire. A total oxygen demand analyzer, a fluoride monitor, and a dissolved oxygen analyzer/controller were field tested. Continuous on-line equipment of proven reliability was located and recommended for measuring conductivity, dissolved oxygen, hydraulic loading, ORP, pH, residual chlorine, temperature, and turbidity. Less acceptable continuous, automatic, or semi-automatic devices for measurement of a large number of parameters were found, but are recommended only where manual procedures are not feasible. For some additional measurements only manually performed laboratory methods are available. Various types of samplers are discussed and recommendations are given. (Knapp-USGS)

ANALYSIS OF COPROSTANOL, AN INDICATOR OF FECAL CONTAMINATION,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
J. E. Singley, C. J. Kirchmer, and R. Miura.
Copy available from GPO Sup Doc as EP1.23:660/2-74-021, $1.60; microfiche from NTIS, Springfield, Va 22161 as PB-235 491, $2.25. Environmental Protection Agency, Technology Series Report EPA 660/2-74-021, March 1974. 114 p, 41 fig, 34 tab, 77 ref, append. EPA Project 16020 EVG.

Descriptors: Analytical techniques, *Gas chromatography, *Colorimetry, *Coliforms, Sewage bacteria, Water pollution, Chemical analysis, Domestic wastes, *Bioindicators, *Pollutant identification.
Identifiers: *Coprostanol, Sewage treatment efficiency, 2,4-dinitrophenylhydrazine, Sample preservation.

Gas chromatographic (GC) analysis of coprostanol was improved by showing that sample esterification before injection is not necessary. The GC method can detect 20 ng/l, which was estimated to be equivalent to approximately two coliforms per 100 ml. Comparison of coprostanol analyses to total and fecal coliform analyses confirmed the predicted advantages of a chemical method over a biological method. Samples were preserved with concentrated sulfuric acid (1 ml/l sample). The GC method was used in extensive field surveys, degradation studies, and treatment plant efficiency studies. A reasonably good correlation between coprostanol concentration and treatment plant efficiency (BOD, COD, and TOC measurements) was found, but further measurements are needed. A colorimetric method was developed to determine coprostanol at a concentration of 1 ug/l. Analysis time was estimated to be two hours, but several samples were analyzed simultaneously. Colorimetric analyses of coprostanol in field samples gave higher results than GC analyses; high colorimetric results were probably due to the presence of other fecal steroids. (Alford-EPA)
W74-11794

THE ECONOMIC DAMAGES OF AIR POLLUTION,
Environmental Protection Agency, Washington, D.C. Office of Research and Development.
T. E. Waddell.
Copy available from GPO Sup Doc as EP1.23:600/5-74-012, $1.95; microfiche from NTIS, Springfield, Va 22161 as PB-235 701, $2.25 MF-PC $3.95. EPA Report, Socioeconomic Studies Series, Report EPA-600/5-74-012, May 1974. 156 p, 5 fig, 22 tab, 5 ref. Program Element 1AA004-26BAF-02.

Descriptors: Economics, *Cost-benefit analysis, *Air pollution effects, *Cost analysis, Damages, *Economic efficiency.

Air pollution is a problem because it endangers man's health and the environment in which he lives. The information researched in this report indicates that the cost of air pollution damage in 1970 (for measured effects only) falls within a range of $6.1 to $18.5 billion, with a 'best' estimate of $12.3 billion. A benefit-cost analytical framework for environmental decision-making is outlined. The methods that have been or can be used to estimate the damages of air pollution are identified. The strengths and weaknesses of each method are discussed. The technical coefficients method is utilized in estimating the value of air pollution damage to human health, to man-made materials, and to vegetation. A particular market study method, the property value approach, was used to estimate aesthetic and soiling-related costs. Economic losses associated with air pollution effects on domestic animals and wildlife and the natural environment are not estimated because of data limitations. Damages are allocated by major pollutant and source category. The utility and limitations of gross damage estimates are discussed, and comparison with other such estimates is made. (EPA)

TRAIL-MARKING AND ALARM PHEROMONES OF SOME ANTS OF THE GENUS ATTA,
State Univ. of New York, Syracuse. Coll. of Environmental Science and Forestry.
R. G. Riley, and R. M. Silverstein.
Available from National Technical Information Service, Springfield, Va 22161 as PB-235 562, $4.75 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA 660/2-74-081, February 1973. 27 p, 2 fig, 15 ref. Grant No 5 R01EP00829-03.

Descriptors: *Bioassay, *Chromatography, Pollutant identification, *Isolation, *Insects.
Identifiers: *Ants, Atta texana, Atta cephalotes, *Pheromones(Alarm), *Pheromones(Trail-marking).

Laboratory studies on two ant species of the Genus Atta, Atta texana and Atta cephalotes have resulted in the isolation and identification of several organic compounds which demonstrate either trail-marking or alarm activity. The alarm pheromones of Atta texana have been identified as 4-methyl-3-heptanone and 2-heptanone. A reinvestigation of this study has shown that Atta texana produces (+)-4-methyl-3-heptanone. This compound has also been identified as the alarm pheromone for Atta cephalotes. The volatile trail-marking substance of Atta texana has been identified as methyl-4-methylpyrrole-2-carboxylate. The isolation and identification of the non-volatile trail pheromone of Atta texana has led to inconclusive results due mainly to erratic bioassay results. Current laboratory research is being focused on the isolation and identification of the volatile trail pheromone(s) of Atta cephalotes. A synthesis of both enantiomers of 4-methyl-3-heptanone is in progress. Their biological activity will be tested on Atta texana and Atta cephalotes following successful completion of the synthesis. ANALYSIS OF BIOLOGICAL, CLINICAL, AND ENVIRONMENTAL SAMPLES USING PROTON-INDUCED X-RAY EMISSION,
Duke Univ. Durham, N.C. Dept. of Physics.
R. L. Walter, R. D. Willis, W. F. Gutknecht, and J. M. Joyce.
Analytical Chemistry, Vol 46, No 7, p 843-855, June, 1974. 19 fig, 16 ref.

Descriptors: *X-rays, *Analytical techniques, *X-ray fluorescence, *Sampling, Coal, Human pathology, Ion exchange, Membranes, Data collections, Irradiation, *North Carolina.
Identifiers: *Proton-induced x-rays, Solid state detector, Biological sampling, Clinical sampling, Environmental sampling, X-ray emissions, Durham(NC).

A 3Mev beam of protons of 2 to 150-nanoampere intensity has been used to excite x-ray emission from a wide range of environmental and biological samples. These include human tissue, body fluids, soil extracts, leaves, coal, fly ash, ion-exchange membranes, and proteins. The x-rays have been detected using a Si(Li) solid state detector for the elements P(Z=15) through Pb (Z=82). Linear response has been demonstrated for the elements Pb, Cu, Zn, Co, and Mn from 5 ng to greater than 2 micrograms. A lower limit of sensitivity of approximately 200 picograms in the irradiated area has been attained with the more responsive elements when they are deposited on very thin substrates. The proton-induced x-ray emission technique seems well suited to rapid and economical multielement analyses for samples of environmental and clinical interest. (Prague-FIRL)
W74-11862

INVESTIGATION OF VOLATILE ORGANIC MICROPOLLUTANTS IN AIR AND WATER USING LOW-TEMPERATURE CAPILLARY GC-MS,
Battelle-Institue e.V., Frankfurt am Main (West Germany).
K. H. Bergert, V. Betz, and D. Pruggmayer.
Chromatographia, Vol 7, No 3, p 115-121, March, 1974. 6 fig, 24 ref.

Descriptors: Pollutants, *Gas chromatography, *Mass spectrometry, Concentrations, Equipment, Analytical techniques, *Pollutant identification, *Air pollution.
Identifiers: *Organic micropollutants, Microgradient tubes, Low temperature.

A method is described which allows routine separation and identification of organic micropollutants within a concentration range 10 to the minus 4th power to 10 to the minus 8th power percent by volume. Enrichment of the components occurs in a microgradient tube. Separation on glass-thin film open tubular columns is by linear-programmed low-temperature gas chromatography (LTGC), and identification is by a mass spectrometer. Mass-spectra are obtained for concentration as low as 0.02 ppb. Analyses can be performed on commercial equipment. (Murphy-FIRL)

POLAROGRAPHIC DETERMINATION OF 8-HYDROXYQUINOLINATES AFTER EXTRACTION WITH NAPHTHALENE. TRACE ANALYSIS OF CADMIUM AND LEAD,
T. Fujinaga, and B. K. Puri.
Bulletin of the Institution of Chemistry Research, Kyoto University, Vol 51, No 5, p 253-267, September, 1973. 4 fig, 9 tab, 12 ref.

Descriptors: *Polarographic analysis, *Cadmium, *Mercury, *Lead, Separation techniques, Analytical techniques, *Pollutant identification.

A rapid extraction-polarographic method has been developed for the direct determination of cadmium and lead extracted into the organic phase. 8-Hydroxyquinolinates of cadmium and lead were extracted with molten naphthalene in the pH range of 7-10 and 9-12 respectively; as the temperature was lowered, naphthalene separated out as a solid mass containing the metal-oxinate. This solid mass was dissolved in dimethylformamide and the polarograms were recorded using 0.1 M sodium perchlorate-0.1 M perchloric acid in case of cadmium and 0.1 M pyridine-0.1 M perchloric acid in case of lead as the supporting electrolytes. Under these conditions, these metal-oxinates gave well defined waves with E sub 1/2 of -0.63 V and -0.47 V versus SCE respectively. The relation between diffusion current and concentration is linear in the range of 0.0-112 micrograms/10 ml for Cd and 0.0-207.0 micrograms/10 ml for Pb. The interferences of various ions had been studied in detail. The method is simple, rapid, sensitive, and applicable for the determination of cadmium, mercury, and lead in various complex materials. (Sandoski-FIRL)

SPECTROPHOTOMETRIC DETERMINATION OF COPPER AND IRON SUBSEQUENT TO THE SIMULTANEOUS EXTRACTION OF BIS(2,9-DIMETHYL-1, 10-PENANTHROLINE) COPPER (I) AND BIS (2,4,6-TRI(2-PYRIDYL)-1, 3, 5-TRIAZINE) IRON (II) INTO PROPYLENE CARBONATE,
Wofford Coll., Spartanburg, S.C. Dept. of Chemistry.
B. G. Stephens, H. L. Felkel, Jr., and W. M. Spinelli.
Analytical Chemistry, Vol 46, No 6, p 692-696, May, 1974. 2 fig, 5 tab, 13 ref. PHS 0H00324.

Descriptors: *Copper, *Iron, *Spectroscopy, *Analytical techniques, Laboratory tests, Testing procedures, Instrumentation, Sea water, Aluminum, Potable water, *Pollutant identification.

Propylene carbonate (4-methyl-1,3-dioxolane-2-one) simultaneously extracts the 2,9-dimethyl-1, 10-phenanthroline (neocuproine; NC) chelate of copper (I) and the tri (2-pyridyl)-1,3,5-triazine (TPTZ) chelate of iron (II) from acetate-buffered aqueous solutions. Molecular absorption spectrophotometric quantification is accomplished by measuring the absorbance of the iron (II)-TPTZ chelate at 596 nm and that of the copper (I)-NC chelate at 458 nm. The copper (I)-NC chelate does not absorb at 596 nm and consequently copper does not interfere with the determination of iron. The iron (II) TPTZ chelate exhibits an absorbance at 458 nm that is 0.123 times its absorbance at 596 nm; therefore, correction for the effect of iron on the determination of copper is straightforward. The development of the method and the results of analyses of sea water, tap water, and aluminum alloy are reported. (Jernigan-Vanderbilt)
W74-11910

SELECTIVE SEPARATION AND CONCENTRATION OF SILVER VIA PRECIPITATION CHROMATOGRAPHY,
Massachusetts Univ., Amherst. Dept. of Chemistry.
W. P. Zeronsa, G. Dabkowski, and S. Siggia.
Analytical Chemistry, Vol 46, No 2, p 309-311, February, 1974. 3 tab, 2 fig, 16 ref. ACS(PRF 5399 AC).

Descriptors: *Separation techniques, *Silver, *Chemical precipitation, *Chromatography, *Analytical techniques, Aqueous solutions, Copper, Mercury, Testing procedures, Chemical reactions, Spectroscopy, Laboratory tests, Instrumentation, *Pollutant identification.

The application of terminal acetylenics to the selective analytical separation and concentration of silver is demonstrated. Other metalloacetylenic-derivatives which form easily and are reversible in aqueous systems were of interest. Other than silver (I), copper (I), and mercury (I and II), none of the metals proceeded to completion or reacted at all. A series of acetylenic compounds and supports was evaluated for column use in precipitation chromatography. Various eluents were also evaluated, and nitric acid was found to be the best for eluting silver. A commercially available, long chain terminal acetylene coated on a solid support was found to have the ability to selectively concentrate and/or separate various concentrations of silver from a variety of cations with minimal sample handling or cationic interferences and no unusual safety hazard. (Jernigan-Vanderbilt)

GRAPHITE BRAID ATOMIZER FOR ATOMIC ABSORPTION AND ATOMIC FLUORESCENCE SPECTROMETRY,
Michigan State Univ., East Lansing. Dept. of Chemistry.
A. Montaser, S. R. Goode, and S. R. Crouch.
Analytical Chemistry, Vol 46, No 4, p 599-601, April, 1974. 1 tab, 2 fig, 13 ref.

Descriptors: *Metals, *Spectroscopy, *Organic matter, Analytical techniques, Copper, Sampling, Instrumentation, Testing procedures, Zinc, Cadmium, Lead, *Pollutant identification.
Identifiers: *Sample preparation.

A new filament-type non-flame atomizer, the graphite braid atomizer (GBA) is described and characterized. The electrically heated GBA is capable of providing temperatures similar to other carbon or graphite atomizers, but with lower applied powers. The graphite braid was used in the AA and AF determination of several elements and showed good sensitivity and linearity. A procedure for the direct analysis of copper in a serum matrix is presented to illustrate the application of the GBA to biological samples. Only a dilution of the serum sample was required prior to the analysis step. (Jernigan-Vanderbilt)

PRELIMINARY STUDIES OF THE SHOCK TUBE AS AN EXCITATION SOURCE FOR THE ANALYSIS OF SELECTED TRACE METALS IN AQUEOUS MEDIA,
Michigan Univ., Ann Arbor. Dept. of Chemistry.
R. D. Sacks, and V. T. Cordasco.
Analytical Chemistry, Vol 46, No 6, p 663-670, May, 1974. 12 fig, 5 tab, 27 ref.

Descriptors: *Trace elements, *Analytical techniques, *Aqueous solutions, Cadmium, Nickel, Instrumentation, Spectroscopy, Heating metals, *Pollutant identification.
Identifiers: *Sample preparation, Shock tube.

The bursting-diaphragm shock tube has been developed for the analysis of selected trace metals in aqueous media. The theory of shock heating is discussed and relations are presented for strong shocks in a number of gases. The importance of shock-wave velocity measurements is considered and both analog and digital measurement techniques are presented. One-hundred microliter aqueous samples of metal salts are deposited on strips of membrane filter. These are supported in the shock tube and analyzed at 10,500K in the reflected region of helium-driven argon shocks. Analytical curves are presented for Pd, Cd, and Ni, both with and without internal standardization. Sub-ppm detection limits are obtained for most elements tested using 100-micro-l samples. The standard deviation is 15% for Cd and 13% for Pd. Matrix effects are significant only for refractory matrix materials. Internal standard selection is discussed with respect to the boiling points of the analyte and matrix. (Jernigan-Vanderbilt)

Available from NTIS, Springfield, Va., 22161 as Rept. No. ORNL-EIS-73-62. $5.45/copy, $2.25/microfiche. Report No ORNL-EIS-73-62, August 1973. 75 p.

Descriptors: *Trace elements, Personnel management, Bibliographies, Technical writing, Toxicity, Universities, Research and development, Census, *Documentation, *Information exchange.
Identifiers: *Directories.

This directory is designed to aid effective communication throughout the National Science Foundation, Research Applied to National Needs, Trace Contaminants Program. The majority of the participants in the Program are represented--by name, address, telephone number, and very brief description of research interest. The research results are being abstracted in the new bi-monthly NSF-RANN Trace Contaminants Abstracts. The directory has three major divisions to facilitate its use. Section I contains listings of the program managers, the principal investigators, and the co-principal investigators and coordinators. Section II lists the personnel by individual projects; while Section III contains a complete alphabetic listing with keyword indexes. (Houser-ORNL)

OBSERVATIONS ON THE DISTRIBUTION OF CHLORINATED HYDROCARBONS IN ATLANTIC OCEAN ORGANISMS,
Woods Hole Oceanographic Institution, Mass.
G. R. Harvey, H. P. Miklas, V. T. Bowen, and W. G. Steinhauer.
Journal of Marine Research, Vol 35, No 2, p 103-118, 1974. 3 fig, 5 tab, 27 ref.

Descriptors: *Polychlorinated biphenyls, *DDT, *Food webs, Absorption, Bioassay, Food chains, *Path of pollutants, Plankton, Pesticides, Gas chromatography, Analytical techniques, DDE, Phytoplankton, Dieldrin, Shrimp, Sharks, Lipids, Environmental effects, *Chlorinated hydrocarbon pesticides, Distribution.
Identifiers: Pelagic, Mesopelagic, Cod, Haddock, Pollock, Halibut, Dolphin.

Industrial PCBs and the DDT family (t-DDT) were measured in several species of organisms collected from the Atlantic Ocean between 66 deg N and 35 deg S latitude. All the organisms had higher concentrations of PCBs than t-DDT. Many trophic levels were collected, but the analytical data offer no support for food chain magnification among gilled organisms. Mixed plankton contained a higher average concentration of PCB (200 microgram/kg) than any other class of gilled organism in the Atlantic. Mesopelagic organisms revealed PCBs and t-DDT in concentrations well below the mixed layer, but ten times lower than pelagic species. The PCB/t-DDT ratio is about thirty in the marine atmosphere, surface water and plankton. The ratio decreases to about three in high predators and in the mid-water organisms, indicating that t-DDT and PCBs move differently through the marine environment. (Katz)

A MULTISOURCE ATMOSPHERIC TRANSPORT MODEL FOR DEPOSITION OF TRACE CONTAMINANTS,
Oak Ridge National Lab., Tenn.
M. T. Mills, and M. Reeves.
Available from National Technical Information Service, Springfield, Va., 22161 as Report No ORNL-NSF-EATC-2; $4.00 paper copy, $2.25 in microfiche. Report No ORNL-NSF-EATC-2, October 1973. 87 p, 4 fig, 9 ref. NSF AG 389.

Descriptors: Model studies, *Computer programs, *Computer models, Meteorology, Transport, Trace elements, *Air pollution, Toxins, Toxicity, Fallout, Hydrologic aspects, Streams, Groundwater, Ecology, *Path of pollutants, Water pollution sources.

Development is reported of an Atmospheric Transport Model (ATM) from a Gaussian plume model to calculate the toxic material deposition rate at any point within a watershed, given the location of various air pollution sources. The sources presently included are the point source (stack), area source (city), line source (road or railbed), and windblown source (dry tailings pond). These rates are then used by the Wisconsin Hydrological Transport Model (WHTM) to determine the subsequent transfer of the toxic materials to the stream and ground water. (Houser-ORNL)

ENVIRONMENTAL RADIATION DOSE CRITERIA AND ASSESSMENT: PATHWAY MODELING AND SURVEILLANCE,
Brookhaven National Lab., Upton, N.Y.
A. P. Hull.
Available from National Technical Information Service, Springfield, Va., 22161 as Report No BNL-18359; $4.00 paper copy, $2.25 in microfiche. Presented at the IEEE 1973 Nuclear Science Symposium (CONF-731112-16), San Francisco, Calif., Nov. 14-16, 1973, BNL-18359, Nov. 1973. 7 p, 3 tab, 26 ref.

Descriptors: *Nuclear powerplants, *Effluents, *Radioactivity, *Fuels, *Monitoring, *Assessment, *Safety, *Evaluation, Standards, Regulation, Administrative agencies, Model studies, *Path of pollutants, Cost-benefit theory.
Identifiers: *Fuel reprocessing plants, *Surveillance programs.

Considerable effort has been devoted to the development of environmental radiation dose criteria and assessment through both pathway modeling and environmental surveillance, ever since the first utilization of nuclear reactors in the United States in the 1940's, and particularly since the advent of civilian nuclear power reactors. Conservative effluent release practices, generally consistent with the as-low-as-practicable philosophy, have been followed. Within the past few years, extensive surveillance at representative nuclear facilities has indicated maximum doses of only a few millirems per year through a few pathways and to small nearby populations. They have been well below the environmental dose limits of 500 mrem/year specified by the ICRP for individuals in the general population, and also generally less than the basic Appendix I limit of 5 mrem/year, proposed by the AEC. However, the Appendix I implementation of this basic limit, in terms of the proposed release and concentration limits, is based on unrealistically conservative assumptions,

which exaggerate its supposed risk-reduction benefits. The benefits of devoting significant resources of manpower and equipment to such an effort toward the ever improvement in the sensitivity of modeling and surveillance of a minimal risk seem most questionable. (Houser-ORNL)

USE OF RIVERS TO PREDICT ACCUMULATION IN SEDIMENT OF RADIO-NUCLIDES DISCHARGED FROM NUCLEAR POWER STATIONS,
Michigan Univ., Ann Arbor. Dept. of Environmental and Industrial Health.
P. Plato.
Health Physics, Vol 26, No 6, p 489-496, June 1974. 4 fig, 8 ref.

Descriptors: *Nuclear powerplants, *Radioactivity, Release, Effluents, *Lakes, *Streams, *Rivers, *Forecasting, Lake Michigan, Flow rates, Suspended solids, Flow characteristics, Measurement, Fallout, Cesium, *Sediments, Deltas, Sedimentation.

The liquid discharge characteristics, which include flow rate, suspended solids content, and radioactivity of the Donald C. Cook and Palisades nuclear power plants are similar to those from the St. Joseph and Black rivers, respectively, in southern Lake Michigan. The areas of influence of the rivers on Lake Michigan are defined by direct measurement of the accumulation of fallout Cs-137 in the sediments near the mouths of the rivers. The areas of influence of the rivers are used to predict the areas of influence expected near the two nuclear power plants after two decades of discharging radioactive wastes into Lake Michigan. An approach, part conceptual and part experimental, is described to examine two rivers as long-term point sources of radioactivity from fallout. When a river discharges its water into a relatively quiescent lake, suspended matter carried by the river settles to the bottom. A deltaic facies is formed where suspended matter from a river accumulates in relatively high amounts on the bottom of a lake. An examination of the deltaic facies for long-lived radionuclides from fallout should given an indication of the area of influence of the river on the lake during the past two decades. If the discharge characteristics of a river and a nearby nuclear power station are somewhat similar, a prediction could be made on the long-term influence of the nuclear power station on the lake. MODELING RADIATION EXPOSURE TO POPULATIONS FROM RADIOACTIVITY RELEASED TO THE ENVIRONMENT,
California Univ., Livermore. Lawrence Livermore Lab.
Y. C. Ng, W. L. Robinson, and D. W. Wilson.
Available from National Technical Information Service, Springfield, Va., 22161 as Report No UCRL-74389, $4.00 paper copy; $2.25 in microfiche. Report No UCRL-74389, May 1973. 14 p, 6 tab, 44 ref.

Descriptors: *Model studies, *Radioactivity, *Projections, *Forecasting, *Effluents, Fallout, Public health, Environmental effects, Aquatic life, Food chains, Water pollution, *Air pollution, Soil contamination, Absorption, Water pollution sources, Safety, Evaluation.
Identifiers: Dosage, Man-rem.

Two approaches are used to estimate the potential population dosages (man-rem) per Curie release of Cesium-137 in the United States from a hypothetical release of a fraction of the projected fission product inventory in 2000. One method involves a parametric analysis of relationships between fallout rates and cesium-137 in the various components of the diet. The other method is a pathways analysis using dose-to-man models of radionuclide transport in the environment and uptake in man. Both methods are applied to an input-output model of radionuclide flux through environmental compartments and man. Population characteristics are developed using census data and dietary habits. Man-rem per Curie estimates are developed for several food-chains and external exposures. External exposure from soil burdens contributes well over half of the man-rem, followed by terrestrial food-chains, with much lower contributions coming from aquatic food chains. Submersion and inhalation exposure from either the initial cloud or from resuspension are insignificant contributions. Calculations by the two methods are in good agreement. The man-rem per Curie estimates are used to order the importance of the various routes of exposure and to investigate the significance of contamination in various parts of the environment. ENVIRONMENTAL MONITORING REPORT, UNITED STATES ATOMIC ENERGY COMMISSION, OAK RIDGE FACILITIES, CALENDAR YEAR 1972.
Union Carbide Corp., Oak Ridge, Tenn.
Report No UCC-ND-244, July 1973. 42 p, 4 fig, 21 tab, 9 ref.

Descriptors: *Monitoring, *Environment, *Radioactivity, *Effluents, *Air pollution, *Tennessee River, *Water pollution, Soil contamination, Food chains, Sampling, Assay, Assessment, Streams, Lakes, Regulation, Public health, Toxicity, Tennessee.
Identifiers: White Oak Creek(TN), White Oak Lake(TN), Clinch River(TN), Poplar Creek(TN), Bear Creek(TN).

The Environmental Monitoring Program for the Oak Ridge area includes sampling and analysis of air, water from surface streams, several food products, flora, and soil for both radioactive and nonradioactive materials. A summary is presented of the results of the program for calendar year 1972. Surveillance of radioactivity in the Oak Ridge environs indicates the atmospheric concentrations of radioactivity were not significantly from other areas in East Tennessee. Concentrations of radioactivity in the Clinch River and in fish collected from the river were less than 1% of the permissible concentration and intake guides for individuals in the neighboring environment. Only very low-level radioactivity is being released to the environment from plant operations and the resulting concentrations in all of the media sampled were well below permissible standards. (Houser-ORNL)

ENVIRONMENTAL LEVELS OF RADIOACTIVITY IN THE VICINITY OF THE LAWRENCE LIVERMORE LABORATORY - 1973 ANNUAL REPORT,
California Univ., Livermore. Lawrence Livermore Lab.
W. J. Silver, C. L. Lindeken, J. W. Meadows, W. H. Hutchin, and D. R. McIntyre.
Available from National Technical Information Service, Springfield, Va., 22161 as Report No UCRL-51547; $5.45 paper copy, $2.25 in microfiche. Report No UCRL-51547, March 1974. 52 p, 13 fig, 25 tab, 9 ref, append.

Descriptors: *Monitoring, *Environment, *Radioactivity, *Sampling, *Analytical techniques, *Data collections, Regulation, Management, Background radiation, Tritium, Fallout, Uranium, Plutonium, Strontium, Soils, Sediments, Surface waters, *California.

The Lawrence Livermore Laboratory continuously monitors the levels of radioactivity within the Livermore Valley and Site 300. Results of analyses performed during 1973 for gross radioactivity and for specific radionuclides of interest in a variety of environmental samples are presented. In all cases, the levels of activity observed during 1973 were found to be below the appropriate concentration guide values in AEC Manual Chapter 0524. Water samples collected within the Livermore Valley exhibited normal background gross beta and tritium activities. Gamma spectral analyses of vegetation samples revealed no gamma-emitting radionuclides other than those present naturally or in global fallout. Assessment of the radiation doses to an individual from the observed environmental activities indicates the contribution from artificially produced radionuclides is small in comparison with the approximately 100 mrem yr dose received from natural sources. THE OCCURRENCE AND RETENTION OF RADIONUCLIDES IN THE SEDIMENTS OF WHITE OAK LAKE,
Oak Ridge National Laboratory, Tenn.
T. F. Lomenick, and D. A. Gardiner.
Health Physics, Vol 11, No 6, p 567-577, June 1965. 5 fig, 3 tab, 10 ref.

Descriptors: *Radioactive waste disposal, *Lake sediments, Lakes, Effluents, *Nuclear powerplants, Research and development, Laboratories,

Water pollution, Water pollution sources, Absorption, Soil contamination, Radioisotopes, Retention, Water storage, Ruthenium, Cesium, Strontium, Cobalt, *Tennessee, *Waste treatment.
Identifiers: *White Oak Lake(TN), *Clinch River(TN).

As a result of the discharges of large volumes of low-level radioactive liquid wastes to surface streams at the Oak Ridge National Laboratory, large quantities of radionuclides have assumulated in the bottom sediments of White Oak Lake. Ruthenium-106 (1038 c) and cesium-137 (704 c) account for more than 90% of the total activity now present at the site, while Co-60 (152 c), the rare earths (17 c, exclusive of Y-90), and Sr-90 (15 c) make up the remainder. More than half of the activity is associated with the upper 6-in. sediment layer, while progressively smaller quantities of activity are found with depth. The ruthenium, which is restricted to a small area in the area in the now dry upper lake bed, is partially water soluble; however, its rate of movement through the soil is slow enough so that radioactive decay reduces the concentration of that reaching surface streams to insignificant levels. Most of the Cs-137 occupies highly selective exchange sites on the illitic fraction of the clay in the sediment and can be desorbed only by disruption of the lattice structure. Only a small fraction of the Co-60 in the soil was found to be exchangeable. It is, therefore, unlikely that any large fraction of the Cs-137 or Co-60 would move from the area except through erosion of the sediment. About one-half of the Sr-90 and the rare earths in the sediment appears to be exchangeable, while the other half is in the form of slightly soluble salts. Through leaching by groundwater, a slow depletion of strontium from the dry part of the lake bed occurs. (Houser-ORNL)
W74-11665

CURRENT PROBLEMS IN THE RADIOECOLOGY OF SOILS AND PLANTS,
Safarik Univ., Kosice (Czechoslovakia).
G. Plitakova, T. Sabova, and M. Zaduban.
Soviet Atomic Energy, Vol 34, No 5, p 465-475, May 1973, 4 fig, 14 ref. Translated from Atomnaya Energiya, Vol 34, No 5, p 380-390, May 1973.

Descriptors: *Nuclear powerplants, *Nuclear explosions, Effluents, *Environmental effects, *Ecology, *Radioecology, *Water pollution, Oceans, Biota, Food chains, Public health, Elements(Chemical), Uranium, Plutonium, Thorium.

The main task of the relatively new scientific discipline known as radioecology is to investigate the laws governing the migration of radioactive substances in the biosphere and the effects of ionizing radiation on living organisms and on the earth's biosphere as a whole. From the fairly abundant experimental material already available today, it is concluded that mankind cannot afford to disregard the presence of radionuclides in nature. The problem of the contamination of food products by radionuclides is one of the most important problems in the field of public health. This is so because the role of the biological effects of small doses of radiation is not understood; the magnitude of the doses caused by the presence of radioactive substances in the daily diet have not yet been established. The contributor to the dose by various ionization sources is not known agreement has not been reached on the assessment of food contamination, etc. The fission of heavy nuclei, chiefly those of of U-235, Pu-239, and Th-232, gives rise to unstable nuclides (fission products), beginning with 30Zn-72 and ending with 66Dy-161, making a total of about 340 nuclides, of which 92 are stable. In nuclear explosions and in 'total' breakdowns of nuclear reactors, the important parameters of the radioactive fission products are their half-lives and the chemical properties characterizing their participation in the physiological processes of the living organisms of the biosphere. The fission products on which the greatest amount of research has been done are: Sr-89, Sr-90-Y90, Zr-95-Nb95, Ru-106-Rh-106, I-131, Cs-137- Ba-317m, Ba-140-La-140, Ce-144-Pr-144, and Pm-147. Identifiers: Personnel exposure, Dose, Dosimetry, White Oak Creek(TN), White Oak Lake(TN), Clinch River(TN).

There were no external or internal exposures to personnel of the Oak Ridge National Laboratory which exceeded the standards for radiation protection as defined in AEC Manual Chapter 0524. There were no accidental releases of gaseous or liquid waste from the Laboratory which were of a level that required a report to the AEC. Ten unusual occurrences involving radioactive materials were recorded during 1971. Nine were recorded for 1970. However, the nine recorded in 1970 was the lowest number since the system of reporting unusual occurrences was established in 1960. The average number reported for the past five years (1966-1970) was 15.6. The safety record for 1971 was very good. As compared to 1970, there were 12.5% fewer medical treatment cases, 22.5% fewer serious injuries, and 20% fewer disabling injuries. The disabling injury frequency rate for 1971 was 0.61 as compared with a frequency rate of 0.76 for 1970. (Houser-ORNL)

THEORETICAL EXPERIMENTAL AND FIELD STUDIES CONCERNING REACTIONS OF RADIOISOTOPES WITH SEDIMENTS AND SUSPENDED PARTICLES OF THE SEA. PART C: APPLICATIONS TO FIELD STUDIES,
International Lab. of Marine Radioactivity, Monte Carlo (Monaco). Oceanographic Museum.
E. K. Duursma, and D. Eisma.
Netherlands Journal of Sea Research, Vol 6, No 3, p 265-324, 1973. 14 fig, 2 tab, 49 ref, 4 append.

Descriptors: *Marine geology, *Sedimentation, *Radioactivity, *Radioisotopes, Behavior, Oceans, Seas, Clay minerals, Ion exchange, Organic matter, Sorption, Acids, *Sediments, Prediction, Forecasting, Waste disposal.

Results are reported of a cooperative study of the radionuclide sediment behavior of 59 characteristic marine sediments. The sediment samples were obtained from the sea floor of the three oceans, the Arctic Seas, the Baltic Sea, the North Sea, the Mediterranean, the Black Sea, and the Red Sea. The radionuclides studied were Sr-90, Cs-137, Zn-65, Co-60, Zr-95/Nb, Mn-54, Fe-59, Ru-106, Pm-147, and Ce-144. Only with Mediterranean sediment the behavior of Pu-240, Ca-45, Rb-86, and Pb-210 was investigated. The sediment composition has been investigated for clay minerals in different grainsize fractions, for median grain size and sorting, for specific surface, for exchange capacity, for organic matter, and for the extractability of the ions Na, K, Ca, Mg, and Fe with acetic acid NH4-acetate, 0.1 N HCl, 20% HCl, and concentrated HCl. Each of the parameters of the sediment composition has been related to the distribution coefficient of sorption which characterizes the radionuclide sediment behavior. The results of these studies may be applied to description and prediction of the behavior of various radionuclides in sea-water sediment systems. Using these data together with knowledge on the hydrography and sedimentology of an area, it may be possible to predict some of the consequences of future waste-disposal practices in this area. REPORTS AVAILABLE IN PLOWSHARE OPEN FILE.
Nevada Operations Office (AEC), Las Vegas.

Available from NTIS, Springfield, Va, 22161 as Rept No NVO-86 (Rev 3); $4.00 paper copy, $2.25 in microfiche. Report No NVO-86 (Rev 3), July 1973. 40 p.

Descriptors: *Nuclear explosions, *Radioactivity, *Secondary recovery(Oil), Natural gas, Geology, Hydrology, Hydraulic engineering, Nuclear engineering, Technology, Research and development, Engineering geology, Toxicity, Public health, *Publications.
Identifiers: *Plowshare.

A significant compilation of scientific and technical information has resulted from Projects Gasbuggy, Rulison, Rio Blanco and Wagon Wheel, all of which are a part of the U.S. Atomic Energy Commission's Plowshare Program to develop peaceful uses for nuclear explosives. The fundamental concept in these underground engineering applications is to use the energy of a deeply buried nuclear explosive to increase the permeability and porosity of rock thereby stimulating the flow of natural gas. Publications concerning Gasbuggy, Rulison, Rio Blanco and Wagon Wheel, that have been placed in the Plowshare Open Files by the Nevada Operations Office are listed. All of these publications are available to the scientific, technical, and industrial communities. Also listed are certain other publications concerning the AEC's safety programs for underground nuclear detonations which may be of particular interest. (Houser-ORNL)

ECOLOGICAL-ENVIRONMENTAL ASSESSMENTS RELATED TO THE FEDERAL REPOSITORY,
Oak Ridge National Lab., Tenn.
R. C. Dahlman, and Y. Tanaka.
Available from NTIS, Springfield, Va 22161 as Report No ORNL-TM-3619; $5.45 paper copy, $2.25 in microfiche. Report No ORNL-TM-3619, July 1973. 55 p, 9 fig, 18 tab, 36 ref, 2 append.

Descriptors: *Radioactive waste disposal, Salts, Sodium compounds, Ecology, *Ecosystems, *Environmental effects, *Path of pollutants, Strontium, Cesium, Plutonium, Behavior, Food chains, Plant growth, Crops, Vegetation, Root systems, Absorption, Soil contamination, Meteorology, Precipitation(Atmospheric), *Kansas.
Identifiers: Salt mine, Lyons(Kan).

In ecological assessments related to the proposed federal repository at Lyons, Kansas, those environmental pathways which are expected to be important in radionuclide movements have been identified from on-site surveys by consultants from Kansas State University. Based on systems analysis techniques and existing literature information on radionuclide behavior in ecosystems, the dynamics of Sr-90 was estimated for plant, litter, soil pathways of a generalized grassland ecosystem. Continuous, low-level release of Sr-90 from repository operations would lead to threefold increases in the concentration in litter according to this stimulation. Subsequent redistribution or concentration through animal food chains are topics for further study. Preliminary assessment also has focused on energy balance in the biotic environment. (Houser-ORNL)
W74-11672

FINAL ENVIRONMENTAL STATEMENT RELATED TO THE PROPOSED COMANCHE PEAK STEAM ELECTRIC STATION UNITS 1 AND 2.
Directorate of Licensing (AEC), Washington, D.C.
Available NTIS, Springfield, Va 22161 as Docket 50445-67; $10.60 paper copy, $2.25 in microfiche. Report No Docket 50445-67 and 50446-67, June 1974. 407 p, 37 fig, 83 tab, 253 ref, 5 append.

Descriptors: *Reservoirs, *Nuclear powerplants, Effluents, Environment, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *Texas.
Identifiers: *Pressurized water reactors, Squaw Creek Reservoir(Tex).

The proposed Comanche Peak Steam Electric Station, Units 1 and 2 will employ two pressurized water reactors located in Somervell County, Texas, which will be cooled by once-through flow of water obtained from and discharged to Squaw Creek Reservoir. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered included climate, hydrology (surface water and groundwater), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion is to issue construction permits subject to the following limitations: (1) Avoid unnecessary adverse environmental impacts during construction, (2) complete preoperational monitoring studies, (3) evaluate alternative intake systems, (4) design station for chlorine control as specified, (5) follow groundwater withdrawal specifications, (6) periodically review construction activities for conformity to conditions set out in construction permits, (7) report any need for evaluation of impacts unnoticed, (8) submit plan of action and analysis for any observed harmful effects or damage. (Houser-ORNL)
W74-11674

FINAL ENVIRONMENTAL STATEMENT RELATED TO THE PROPOSED SUMMIT POWER STATION UNITS 1 AND 2 - DELMARVA POWER AND LIGHT COMPANY.
Directorate of Licensing (AEC), Washington, D.C.
Available from NTIS, Springfield, Va 22161 as Docket No 50450-97, $7.60 paper copy, $2.25 in microfiche. Report No Docket 50450-97 and 50451-97, July, 1974. 275 p, 39 fig, 67 tab, 180 ref, 9 append.

Descriptors: *Nuclear powerplants, Effluents, *Environment, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Delaware, *Canals.
Identifiers: *Gas cooled reactors, *Chesapeake Canal, *Delaware Canal.

The proposed Summit Power Station - Units 1 and 2 is located in New Castle County, Delaware, and will employ two high-temperature gas-cooled reactors cooled by natural-draft hyperbolic cooling towers, using water from the Chesapeake and Delaware Canal. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and groundwater), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion is to issue construction permits subject to the following conditions: (1) Avoid all unnecessary adverse environmental impacts possible during construction; (2) Give written notice of unevaluated impacts and give acceptable analysis of these and a plan of action to eliminate them; (3) Take necessary steps to protect larval and young striped bass; (4) Control residual chlorine in the discharge; (5) Complete preoperational studies and monitoring as specified; (6) Get staff approval of modifications to the intake design. WATER QUALITY INVESTIGATIONS ON FORESTED CATCHMENTS IN THE COTTER RIVER VALLEY,
Commonwealth Forestry and Timber Bureau, Canberra (Australia). Forest Research Inst.
S. J. Midgley.
In: Proceedings of the Urban Water Economics Symposium, April 28, 1973. University of Newcastle, New South Wales, University of Newcastle Research Associates Ltd., C. Aislabie, editor, p 114-118, 1973. 2 tab, 1 ref.

Descriptors: *Reservoirs, *Forest watersheds, *Water quality controls, *Water supply, *Forest fires, Conductivity, Potassium, Calcium, Sodium, Suspended solids, Sediments, Monitoring, Turbidity, Hydrogen ion concentration, *Australia.
Identifiers: Clear felling, Slash burning, Prescribed burning, Canberra(Aust), *Cotter River Valley(Aust).

Fourteen experimental forested water catchments are being monitored to determine the effects of fires in the forested areas on the water quality of the catchments. All are located on the Cotter River catchment, the supplier of the city of Canberra. Types of fires being studied are: clear felling of the pine cover followed by slash burning, low intensity prescribed burning, moderately intense wildfire. Preliminary studies of baseline data and control catchment data have been performed on the first two, and burning has been completed, but to date only limited data is available. On December 21, 1972, a wildfire occurred over 190 hectares of the experimental area. Samples were subsequently taken from the burnt catchment and compared with those taken from a similar unburnt catchment. Sediment and turbidity showed no significant difference but burning appeared to cause increases in conductivity (30 vs 65.9 umhos/cm), potassium (1.1 vs 2.0 ppm), magnesium (0.9 vs 3.8 ppm), calcium (1.6 vs 4.0 ppm), and sodium (3.1 vs 5.3 ppm). The lack of baseline data places some doubt on the differences. The lack of significant change in sediment (suspended solid) contradicts most earlier studies. It is believed that this is primarily due to the absence of high intensity rain events over the catchment. The light rain that fell may have served only to compact loose soil rather than erode it. POLLUTION AND POISONING,
Southern Illinois Univ., Edwardsville.
S. K. Hall.

Environmental Science and Technology, Vol 6, No 1, p 31-35, January, 1972. 2 fig, 1 tab, 5 ref.

Descriptors: *Lead, *Toxicity, Inorganic compounds, Organic compounds, *Industrial wastes, Heavy metals, Water pollution effects, Water pollution sources.

Of the nonferrous metals, lead is one of the most widely used in industry and everyday life. The annual consumption in the U.S. alone, is well above one million tons. Today it is an ubiquitous element present in food, water, and air, and in the past two decades, man's continuing use of lead has produced an environmental level far above that which would exist naturally, and this could have grave consequences on human health. Lead is a natural constituent of soil, water, vegetation, animal life, and air. Significant sources of naturally occurring lead include dust from soils and particles from volcanoes. In contrast to certain other metals such as mercury, lead in its elemental form is not a major source of poisoning. Two major routes by which lead enters the human body are the alimentary and respiratory tracts. The mean dietary intake of lead for adult Americans is 300 micrograms/day. The average concentration of lead in American adult blood is 27 micrograms. Whether or not lead concentrations measured are hazardous to human health, any further increase of lead in the environment will result in further concentration in some food chains, leading ultimately to toxic doses for man or some other important organism. Lead pollution, therefore, must be controlled. (Jernigan-Vanderbilt)
W74-11702

TRANSFER OF MERCURY AND CADMIUM FROM TERRESTRIAL TO AQUATIC ECOSYSTEMS,
Oak Ridge National Lab., Tenn.
J. W. Huckabee, and B. G. Blaylock.
In: Metal Ions in Biological Systems, Plenum Publishing Corporation, New York, p 125-160, Sanat K. Dhar, editor, (1973). 10 fig, 1 tab, 43 ref.

Descriptors: *Mercury, *Cadmium, *Ecosystems, *Biological communities, *Ecological distribution, Food chains, Aquatic environment, Water pollution, Soil contamination, Transfer, Heavy metals, National parks.
Identifiers: *Great Smoky Mountains National Park.

A heavy metals research strategy proceeded in three steps: (1) determination of natural background concentrations of mercury and cadmium in biota in an unpolluted area, (2) microcosm experiments in which radiotracers were employed to illustrate the transfer of mercury and cadmium from terrestrial to aquatic ecosystems, (3) specific laboratory and field experiments suggested by the microcosm experiments or other data. The transfer rate of mercury and cadmium from terrestrial to aquatic ecosystems is dependent upon the residence time in the terrestrial compartments. The terrestrial cycling of inorganic mercury and cadmium was investigated by tagging field plots with soluble Hg203 and Cd109. At the end of one growing season, the vegetation contained four times more cadmium than mercury. The data indicate that inorganic mercury is lost more readily from vegetation than is cadmium. An uptake study with bean plants showed a large difference in the translocation rate and concentrations of inorganic and the most toxic methylmercury. Sixty-eight to 77% of Cd109 added to the terrestrial portion of the ecosystem was bound there in contrast to 42 to 54% of Hg203 bound. Stream and terrestrial experiments indicated the greater mobility of mercury in the environment. It was concluded that food chain uptake probably can account for a significant per cent of the mercury body burden in fish. (Jernigan-Vanderbilt)

ASPECTS OF THE DISTRIBUTION AND TRACE ELEMENT COMPOSITION OF SUSPENDED MATTER IN THE BLACK SEA,
Woods Hole Oceanographic Institution, Mass.
D. W. Spencer, P. G. Brewer, and P. L. Sachs.
Geochimica et Cosmochimica Acta, Vol 36, p 71-86, 1972. 8 fig, 5 tab, 12 ref.

Descriptors: *Trace elements, *Suspended solids, Marine organisms, Adsorption, Chemical precipitation, Testing procedures, Analytical techniques, Distribution, *Path of pollutants, Water pollution sources.
Identifiers: *Black Sea, Sea of Azov.

Eight to 10 l water samples from the Black Sea collected in March and April, 1969 were filtered through 0.45 micron membrane filters. Detrital silicate particles from rivers dominated the suspended matter but a significant influence from the Sea of Azov was detectable. The concentrations of Mn, Fe, Co, Hg, Sc, Zn, La and Sb in the suspended matter have been determined by instrumental neutron activation analysis. From these data it is apparent that the distribution of these elements in vertical profiles is influenced by four processes: (1) The presence of detrital silicates; (2) Precipitation as sulfides in the deep water; (3) Coprecipitation with or adsorption by MnO2 that is precipitated just above the oxygen zero boundary. This is due to the upward flux of dissolved Mn(II) by advection and diffusion, and (4) Concentration by marine organisms in the surface waters. The profiles of scandium, lanthanum and iron are dominated by process (1) but processes (2), (3) and (4) also can be shown to be significant for iron. The manganese profile is dominated by process (3) and the zinc profile by process (2) while the profiles of cobalt, antimony and mercury are influenced by processes (1), (2) and (3). LEAD IN NEW-FALLEN SNOW NEAR A LEAD SMELTER,
Institute of Occupational and Radiological Health, Belgrade (Yugoslavia).
Z. Kerin.
Archives of Environmental Health, Vol 26, No 5, p 257-259, May, 1973. 2 fig, 1 tab, 6 ref.

Descriptors: *Lead, *Snow, Distance, *Air pollution, Quantitative analysis, Analytical techniques, Time, Topography, Altitude, Industrial effluents, *Industrial wastes.
Identifiers: *Smelter, *Yugoslavia.

In a mountainous area of Yugoslavia, where a lead mine and smelter have been in operation for some 300 years, samples of new-fallen snow were obtained within three zones situated at increasing distances in different directions from the two centrally located stacks of the smelter, and were analyzed for their lead content. The lead content of new snow would be an indication of the quantities of lead in the air through which precipitation of moisture has occurred. The results confirmed the expectation that, with increasing distance from the source of lead emission, the snow contained consistently decreasing quantities of lead. Moreover, samples of new-fallen snow collected at altitudes that differed from that of the stacks yielded results that deviated from each other to such an extent as to alter significantly the negative correlation of the results with an increasing distance of the sampling sites from the stacks. FATE AND EFFECTS OF OIL POLLUTANTS IN EXTREMELY COLD MARINE ENVIRONMENTS,
California Inst. of Tech., Pasadena. Jet Propulsion Lab.
R. M. Atlas.
Available from the National Technical Information Service, Springfield, Va 22161, as AD-769 895, Price $3.00 printed copy; $2.25 microfiche. Final Report to Office of Naval Research, October 1973. 34 p, 6 fig, 5 tab, 16 ref. ONR Contract NAS 7-100.

Descriptors: *Oil spills, *Oily water, *Arctic, *Alaska, *Biodegradation, Water pollution effects, Water pollution treatment, Nutrients, Bacteria, Fungi, Algae, *Path of pollutants.

The interactions of microorganisms and Prudhoe crude oil were studied in Alaskan coastal waters. The main study site was located at Prudhoe Bay in Arctic Alaska. Some work was also done at Valdez, the proposed southern terminus for the trans-Alaskan pipeline. Other experiments were conducted at Umiat and Cape Simpson where there are large natural oil seepages. The rates of crude oil mineralization were higher for Prudhoe Bay water samples than for water samples collected at Valdez. Nitrogen and phosphate levels were about 0.5 ppm and 0.05 ppm respectively, which are lower than those levels required for extensive petroleum biodegradation. Total microbial populations were about 100/ml at Valdez and 1000/ml at Prudhoe Bay. Oil degrading microorganisms were about 0.1/ml at Valdez and 0.7/ml at Prudhoe Bay. When Prudhoe crude oil was incubated with water from coastal ponds along Prudhoe Bay, the bacterial populations increased in numbers by several orders of magnitude. There was a qualitative change in the algal population with a disappearance of coccoid green algae, but the remaining algae did not appear to be inhibited. Miniature contained oil slicks were floated in Prudhoe Bay. After 5 weeks of exposure, the nonbiological losses were 31%, the natural losses, including biodegradation (unfertilized), were 60% and the stimulated losses (fertilized) were 80% of the added oil by weight. (Knapp-USGS)
W74-11725

SURFACE JET STREAM EXCESS TEMPERATURE ANALYSIS,
Geological Survey, Bay Saint Louis, Miss.
E. Mackenroth, and L. H. Motz.
Available from NTIS, Springfield, Va. 22161 as PB-226 120, Price $3.75 printed copy; $2.25 microfiche. Computer Contribution, September 1973. 28 p, 2 fig, 8 ref, 5 append.

Descriptors: *Thermal pollution, *Mathematical models, *Computer programs, *Jets, *Path of pollutants, Streams, Streamflow, Open channel flow, Equations, Numerical analysis.

A computer program is designed for use with a mathematical two-dimensional model which predicts the behavior of a heated surface jet discharging into an ambient flowing stream. Variables which are predicted include jet temperature and velocity decay, jet trajectory, and jet width. The model is based on a joint solution of a system of ordinary differential equations. (Knapp-USGS)
W74-11748

MOVEMENT AND DISPERSION OF SOLUBLE MATERIALS IN SALEM CREEK, MUDDY CREEK AND YADKIN RIVER BETWEEN WINSTON-SALEM AND SALISBURY, NORTH CAROLINA,
Geological Survey, Raleigh, N.C.
K. L. Lindskov.
Available from NTIS, Springfield, Va. 22161 as PB-232 801, Price $3.25 printed copy; $2.25 microfiche. Water-Resources Investigation 6-74, 1974. 26 p, 12 fig, 2 tab, 11 ref.

Descriptors: *Path of pollutants, Rivers, *North Carolina, *Mixing, *Tracers, *Dispersion, Fluorescent dye, *Dye releases, Discharge(Water), Low flow, Water quality, Water pollution sources, Travel time.

Fluorescent dye was used to trace the movement of waterborne wastes over a reach of about 41 miles beginning at the sewage treatment plant on Salem Creek and ending on the Yadkin River at High Rock Lake near Salisbury, North Carolina. Total traveltime for the entire reach ranges from about 28 hours during periods of high streamflow to about 47 hours during periods of low flow. Longitudinal dispersion ranges from about 8 hours at the upper end of High Rock Lake during periods of high flow to about 15 hours during periods of low flow. During high-flow conditions wastes entering the Yadkin from Winston-Salem disperse across the river in a few miles. Under low-flow conditions lateral dispersion is still incomplete more than 10 miles downstream. Longitudinal dispersion causes the maximum concentrations resulting from slug injections to decrease significantly as the traveltime increases. Water entering the Yadkin River from Muddy Creek during low-flow periods does not completely disperse laterally for more than 10 miles below the confluence, but, when the Yadkin River discharge is above 5,000 cfs, lateral mixing is complete within a few miles below the confluence. (Knapp-USGS)
W74-11749

FEASIBILITY OF DIGITAL WATER-QUALITY MODELING ILLUSTRATED BY APPLICATION AT BARSTOW, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
S. G. Robson.
Water-Resources Investigations 46-73, February 1974. 66 p, 30 fig, 2 tab, 17 ref, append.

Descriptors: *Mathematical models, *Water quality, *Path of pollutants, *California, Simulation analysis, Costs, Data collections, Hydrogeology, Dispersion, Alluvium, Mixing, Groundwater movement.
Identifiers: *Barstow(CA).

The feasibility of a digital water-quality model of the shallow alluvial aquifer near Barstow, California, was evaluated to determine the applicability of the computer program to varied hydrologic problems. The evaluation was made on the basis of the data requirements of the model, the characteristics and limitations of the computer program, the relevance of the results, and the costs. Two-well tracer-dilution tests may not be an adequate means of determining the aquifer dispersivity and porosity for use in a water-quality model. Such tests may not be necessary because of the relative insensitivity of such a model to these parameters. The water-quality model is not readily applicable to hydrologic conditions such as abrupt changes in aquifer saturated thickness or transmissivity. Declines in head that are large in relation to the saturated thickness of the aquifer can cause disruptions in water-quality calculations in the model. When the model was tested, results were relevant to the real-life head and water-quality conditions in the aquifer near Barstow and provided an excellent means of evaluating the cause-and-effect relations associated with groundwater pollution. The cost of operating the water-quality model may be nominal if a small number of model nodes and a short simulation period can be used. (Knapp-USGS)
W74-11750

A WATER-QUALITY RECONNAISSANCE OF BIG BEAR LAKE, SAN BERNARDINO COUNTY, CALIFORNIA, 1972-73,
Geological Survey, Menlo Park, Calif.
G. A. Irwin, and M. Lemons.
Available from NTIS, Springfield, Va 22161 as PB-232 708, Price $3.25 printed copy; $2.25 microfiche. Water-Resources Investigations 3-74, May 1974. 40 p, 8 fig, 18 tab, 11 ref.

Descriptors: *Limnology, *Water quality, *Lakes, *California, Nutrients, Primary productivity, Water pollution sources, Water pollution effects, Irrigation water, Phosphates, Nitrates, Dissolved oxygen, Eutrophication.
Identifiers: *Big Bear Lake(Calif).

A water-quality reconnaissance study of the Big Bear Lake area in southern California was made from April 1972 through April 1973. The concentration and distribution of primary nutrients, organic carbon, dissolved oxygen, phytoplankton, and water temperature in the lake were measured. Nitrogen, phosphorus, and silica loading to the lake from surface-water tributaries and precipitation were estimated. Big Bear Lake is moderately eutrophic in regard to nitrogen, phosphorus, and organic content. Nitrate was found in either trace concentrations or below detectable limits; however, ammonia nitrogen was usually detected in concentrations greater than 0.05 milligrams per liter. Orthophosphate phosphorus was detected in mean concentrations ranging from 0.01 to 0.05 milligrams per liter. Organic nitrogen and phosphorus were also detected in measurable concentrations. Seasonal levels of dissolved oxygen indicated that the nutrients and other controlling factors were optimum for relatively high primary productivity. However, production varied both seasonally and areally in the lake. Primary productivity was highest in the eastern and middle parts of the lake. The middle and western parts of the lake exhibited severe oxygen deficits in the deeper water during the warmer months of June and July 1972. (Knapp-USGS)
W74-11753

SIMULATION OF MAJOR INORGANIC CHEMICAL CONCENTRATIONS AND LOADS IN STREAMFLOW,
Geological Survey, Washington, D.C.
T. D. Steele.
Available from NTIS, Springfield, Va 22161 as PB-222 556, Price $3.75 printed copy; $2.25 microfiche. Computer Contribution Interim Report, August 1973. 30 p, 3 fig, 2 tab, 6 ref.

Descriptors: *Computer programs, *Simulation analysis, *Water quality, *Water chemistry, Data processing, Data storage and retrieval.

A computer program is presented for simulation of concentrations and loads of major inorganic chemical constituents, based upon continued daily records of index variables such as specific conductance or stream discharge, and derived functional relationships between solute concentrations and one or both of the index variables. The simulation program estimates daily concentrations and loads of the major inorganic constituents and computes weekly, monthly, and annual time-weighted and discharge-weighted average concentrations. An ionic balance is calculated in each case where the relative abundance of the major ions is simulated or averaged, in order to serve as some measure of the adequacy of the technique. Numerous input and output options are provided, depending upon the availability of data and purposes of the program results. Two peripheral programs to the streamflow chemical-quality simulation program are described for obtaining the earlier-formatted daily constituent records. Card deck setup and job-control-language (JCL) cards required for the simulation program are also described. (Knapp-USGS)
W74-11764

A MODEL OF CIRCULATION AND DISPERSION IN PEARL HARBOR,
Environmental Prediction Research Facility (Navy), Monterey, Calif.
S. Larson.
Available from NTIS, Springfield, Va 22161 as AD-772 094, Price $3.00 printed copy; $2.25 microfiche. Technical Note No 9, November 1973. 32 p, 19 fig, 3 tab, 3 ref.

Descriptors: *Water circulation, *Harbors, *Hawaii, *Path of pollutants, Tides, *Dispersion, Mixing, Tidal streams, Estuaries, Water pollution *Model studies.
Identifiers: *Pearl Harbor(Hawaii).

Circulation and dispersion were studied in Pearl Harbor, Hawaii, using a single layer Hydrodynamical-Numerical model. The equations, the imposed boundary conditions, and the dispersion scheme

are briefly described. Examples of hourly volume transport and integrated volume transport are presented for three sections in the harbor. Examples of the velocity field at various times are also given. The maximum exchange between Pearl Harbor and the sea was found to be 8900 cu m over one tidal cycle. Streams discharging water into Pearl Harbor noticeably effect the local velocity field only during periods of slack water and incoming tide. (Knapp-USGS)

POLLUTED GROUNDWATER: A REVIEW OF THE SIGNIFICANT LITERATURE,
General Electric Co., Santa Barbara, Calif. Center for Advanced Studies.
D. K. Todd, and D. E. McNulty.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 556, $5.75 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA-600/4-74-001. March 1974. 215 p, 661 ref. Program Element 1H1325, EPA Contract 68-01-0759.

Descriptors: *Documentation, *Bibliographies, *Water pollution sources, *Water pollution effects, *Water pollution control, *Monitoring, Underground waste disposal, Aquifer management, *Groundwater, Management, Water pollution, Waste disposal wells, Saline water intrusion, Reviews, Path of pollutants.

A selective review is presented of the literature on man-caused groundwater pollution, including causes and occurrence, procedures for control, and methods for monitoring. No attempt was made to develop a comprehensive bibliography on the subject. Rather, references were selected for inclusion on the basis of their significance and relevance. Bibliographies, important general references, abstracts, and European references are discussed separately. Thereafter the literature is described in essay form on a subject basis. References cited by number in the text are listed in complete bibliographic form at the end of the report together with an author index. With few exceptions, the material reviewed is limited to relatively recent published items in the United States. Administrative regulations, legal reports, and unpublished materials such as these have been omitted. (EPA)

Descriptors: Runoff, *Herbicides, Simulated rainfall, *Soil types, Coastal plains, Gas chromatography, *Path of pollutants, *Sediments, Pollutant identification, Water pollution sources.
Identifiers: *Pesticide movement, Preferential herbicide loss, Atrazine, Dichlobenil, Fallow plots.

The movement of two herbicides in runoff and on sediment were studied as examples of pesticides in general use. Gas chromatography was used to determine the losses of atrazine (2-chloro-4-ethylamino-6-isopropylamino-s-triazine) and dichlobenil (2,6-dichlorobenzonitrile) from fallow plots on four Coastal Plain soil types following the application of about 13 cm (5 in.) of rainfall in 2 hours. The herbicides, as wettable powders, were surface-applied and incorporated. Simulated high intensity (a 100-year frequency storm) rainfall was started 1 hour after application. Significant amounts of both compounds were transported. The percent loss was greater in all cases for atrazine, but because more dichlobenil was applied, its losses were greater on an absolute basis. Some of the herbicide in the sediment may have been transported as discrete particles rather than as an adsorbate. The greatest combined (runoff plus sediment) losses of atrazine in all soils and of dichlobenil in two soils occurred during the first 40-50 minutes of runoff. During this time, the absolute amount of both herbicides was greater in runoff, but the concentrations were greater in the sediment. The preferential loss of certain claysized materials during the first 50 minutes of runoff may explain the high herbicide concentration in sediment relative to later times. (EPA)

Environmental Protection Agency, Technology Series Report EPA-660/2-74-056, June 1974. 325 p, 41 fig, 47 tab, 403 ref, 2 append. EPA Program Element 1BA024. Contract No 68-01-0777.

Descriptors: *Groundwater, *Water pollution sources, *Landfills, *Septic tanks, *Waste storage, *Northeast U.S., New York, New Jersey, Pennsylvania, Maryland, Delaware, Research priorities, Water quality control, Degradation(Decomposition).

An evaluation of principal sources of groundwater contamination has been carried out in 11 northeast states, including all of New England, New York, New Jersey, Pennsylvania, Maryland, and Delaware. The findings have been used to determine priorities for research into ways to correct existing sources of contamination and to point out deficiencies in present control methods for protection against further degradation of groundwater quality. Principal sources of groundwater quality degradation caused by man's activities that are common to most parts of the region are septic tanks and cesspools, buried tanks and pipelines including sanitary and storm sewers, the application and storage of highway deicing salts, municipal and industrial landfills of solid waste, unlined surface impoundments, spills, and the uncontrolled discharge of pollutants on the land surface. In New York and Pennsylvania, mining and petroleum exploration and development have caused many instances of groundwater contamination, but the extent of the problem has not been defined. Salt-water intrusion in coastal areas has been adequately controlled, but little is known of the potential threat to fresh-water aquifers from the encroachment of saline water that naturally occurs in inland formations underlying the western portions of the region. MUNICIPAL EFFLUENT CHARACTERISTICS,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Environmental Sciences.
J. V. Hunter.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 165-180, 1973. 9 tab, 16 ref.

Descriptors: *Municipal wastes, *Effluents, Investigations, Chemical properties, Physical properties, Activated sludge, Organic matter, Heavy metals, Inorganic compounds, *Waste identification.
Identifiers: *Waste characteristics.

The physical and chemical characteristics of secondary effluents are presented with results of the following investigations statistically tabulated: total solids distributions for an activated sludge effluent, variation in effluent quality of an activated sludge plant, organic parameter distributions for an actual sludge effluent, chemical composition of soluble-colloidal organic matter in a trickling filter effluent, composition of trickling filter effluent particulates, average inorganic composition of municipal secondary effluents, general composition of secondary treatment plant effluents, and heavy metal constituents of secondary treatment plant effluents. Although there have been extensive investigations into the nature of the organic constituents of effluents, most of the particulate organics are still unknown and even the soluble organics have only been classified by solubility and extractive procedures rather than by molecular species present. FATE OF MATERIALS APPLIED,
Robert S. Kerr Environmental Research Lab., Ada, Okla.
R. E. Thomas.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 181-200, 1973. 15 ref.

Descriptors: *Suspended solids, *Nutrients, *Waste water treatment, Infiltration, *Irrigation systems, Land management, Waste disposal, Overland flow, *Path of pollutants.

The fate of suspended solids, major plant nutrients of environmental concern, and other selected constituents of waste water when this waste water is applied to the soil are summarized. Methods of application include the crop irrigation, infiltration, and spray-runoff. An insight into the mechanism involved and the practical aspects in the treatment or renovation of waste water by applying the waste water to the land is presented. NUTRIENT LOADING FROM A SEPARATE STORM SEWER IN MADISON, WISCONSIN,
Bechtel Corp., San Francisco, Calif.
J. W. Kluesener, and G. F. Lee.
Journal of the Water Pollution Control Federation, Vol 46, No 5, p 920-936, May, 1974. 16 fig, 3 tab, 14 ref.

Descriptors: *Urban runoff, *Separated sewers, *Rainfall-runoff relationships, Nutrients, Lakes, Basins, Nitrogen, Phosphorus, Flow, Rainfall, Sampling, Storm water, Storm runoff, *Wisconsin, Storm sewers.
Identifiers: *Nutrient loading, Chemical data, *Madison(Wis).

A study was undertaken to explore implications of nutrient loading from separate storm sewers and characteristics of nutrients in urban runoff. The following determinations were attempted: rainfall-runoff relationships for a selected basin in Madison, Wisconsin; seasonal and storm-duration variability of nutrient concentrations; annual nutrient loading; sampling requirements for nutrient loading quantification; significance of urban runoff with respect to other known sources of nutrients influent to a lake in Madison. Percent runoff was found to be equivalent to the area of the basin covered by streets, and varied as a function of rainfall amount. Nutrient and SS concentrations were greatest during the early stages of a runoff event; high phosphorus concentrations occurred during the spring and fall, while nitrogen concentration was high during the spring. The major source of inorganic-N was rainfall, whereas phosphorus was generated by litter and possibly by auto exhaust. Preference for sampling procedures are in the following order: (1) flow-proportioned sampler; (2) characterization of a basin by collection of flow and chemical data over fairly short time intervals for several storms. (Murphy-FIRL)

STUDIES ON MODELING OF URBAN STORM WATER RUNOFF--ON THE RELATION BETWEEN THE COMPOSITION OF BASIN MODEL AND THE EQUIVALENT ROUGHNESS,
E. Toyokuni, and K. Hagihara.
Memoirs of the Ehime University, Section III (Engineering), Vol 7, No 1, p 49-64, 1974. 12 fig, 1 tab, 18 ref.

Descriptors: *Storm runoff, *Hydrological data, *Model studies, Drainage, Drainage areas, Surface drainage, Urban runoff.
Identifiers: *Kinematic wave method, Urban storm water runoff, *Japan.

On the basis of observed hydrological data in a research basin, the relation between the composition of the basin model in the homogeneous surface and the equivalent roughness for each model and adaptability of the runoff model are discussed. These are representations of equivalent drainage area for the heterogeneous area composed of roof, asphalt road, or pervious ground surface. Each of three models, one simple and two more complex, are derived theoretically from the elements of composition in the basin model, applying the kinematic wave method. (Prague-FIRL)

POPULATION, RESOURCES, AND POLLUTION, AND THEIR IMPACT ON THE HUDSON ESTUARY,
Woods Hole Oceanographic Institution, Mass.
B. H. Ketchum.
Hudson River Colloquium, Annals of the New York Academy of Sciences, Vol 250, p 144-156, May 24, 1974. 10 fig, 1 tab, 13 ref.

Descriptors: *Data collections, *Hudson River, *Surveys, Sewage disposal, Nutrients, Water pollution sources, Water pollution control, Environmental effects, Phosphorus, Phytoplankton, Chlorophyll, *Estuarine environment, *New York.

Data are presented on the distribution properties in the lower end of the Hudson estuary so as to define and delineate some of the problems that should be further investigated. Such data indicate that the Hudson River estuary is not itself capable of accepting and recycling the nutrients that are being added to it in the sewage from the population of the city of New York. Adequate control of the domestic sewage will require the removal of a substantial part of the nutrients as well as the removal of the organic material that creates the biochemical oxygen demand. (Sandoski-FIRL)

THE ILLINOIS URBAN DRAINAGE AREA SIMULATOR, ILLUDAS,
Illinois State Water Survey, Urbana.
M. L. Terstriep, and J. B. Stall.
Bulletin 58, 1974. 90 p, 82 fig, 34 tab, 33 ref.

Descriptors: *Model studies, *Urban hydrology, *Computer models, *Urban drainage, *Watersheds(Basins), Drainage area, Drainage systems, Storm runoff, Mathematical models, Urban runoff, Hydrology, Sewers, Hydrographs, Overland flow, Surface runoff, Computer programs, Simulation analysis, Infiltration, Rainfall-runoff relationships, Routing, Hydrologic systems, Hydrologic aspects, Storm drains, Vegetation effects, Floods, Runoff forecasting, Paved areas, Drainage, Rainfall, Hydraulics.
Identifiers: Drainage design, Hydrologic simulation.

An objective method is presented for the hydrologic design of storm drainage systems in urban areas and for the evaluation of an existing system. The method, based on a digital model known as The Illinois Urban Drainage Area Simulator (ILLUDAS), uses storm rainfall and physical basin parameters to predict storm runoff from both paved areas and grassed areas. ILLUDAS utilizes the directly connected paved area concept of the British Road Research Laboratory (RRL) method but also recognizes and reproduces runoff from grassed and nonconnected paved areas. Included are a description of the theoretical development of the model, verification of the model by its application to 21 existing urban basins in the United States (from 0.39 acres to 8.3 square miles) and 2 rural basins, and a users manual that describes in detail the actual use of ILLUDAS in design applications. The ILLUDAS is available in the form of a 700-card FORTRAN IV deck. A description of the input deck in its proper order and the actual content and format for each card are presented. This model provides consulting engineers with an objective and reliable method for urban storm drainage design that requires little more input data than a rational method solution. (Humphreys-ISWS)

DO-SAG IN OSCILLATING FLOW,
Syracuse Univ., N.Y. Dept. of Civil Engineering.
W-H. Li, and M. E. Kozlowski.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 100, No EE4, Proceedings Paper 10713, p 837-854, August 1974. 9 fig, 11 ref, 2 append. NSF Grant No. GK-33815.

Descriptors: *Oxygen sag, *Tidal streams, *Dispersion, *Mathematical models, Biochemical oxygen demand, Dissolved oxygen, Water pollution, Flow, Rivers, Outfall sewers, Environmental engineering, Mathematics, Analytical techniques.
Identifiers: *Oscillating flow.

The biochemical oxygen demand (BOD) and the dissolved oxygen (DO) deficit in an oscillating flow due to a steady supply of BOD from an outfall were studied. Formulas were derived for the maximum BOD concentration and DO deficit by the method of perturbation. These results serve as the upper bounds for a tidal river during a dry season. (Humphreys-ISWS)

CONCENTRATION OF HEAVY METALS IN SEDIMENT CORES FROM SELECTED WISCONSIN LAKES,
Wisconsin Univ., Madison. Dept. of Soil Science.
I. K. Iskandar, and D. R. Keeney.
Environmental Science and Technology, Vol 8, No 2, p 165-170, February, 1974. 5 fig, 5 tab, 34 ref. 133-7659.

Descriptors: *Heavy metals, *Wisconsin, *Lake sediments, Spectroscopy, Water pollution, Distribution patterns, Copper, Zinc, Cadmium, Lead, Nickel, Chromium, Temporal distribution, Water pollution sources.

The concentrations of Cu, Zn, Cd, Pb, Cr, and Ni in sediment cores from five hard-water and five soft-water lakes in Wisconsin were determined. Based on estimates of sedimentation rates, the sediment samples used for estimation of the early cultural or precultural concentrations were deposited 140 to 400 years ago. The precultural concentrations of Cu, Zn, Cd, and Pb were, in nearly all cases, less than those of postcultural and especially of modern (0-10cm) sediments. In general, there was no significant trend in the vertical distribution of Ni, but four of the 10 lakes had accumulated Cr in recent times. The accumulation of Cu in three of the hard-water lakes investigated was related to copper sulfate (used as an algalcide) input from 1918 to 1944. Surface enrichment may have been due to runoff from urban and agricultural lands and from sewage inputs. The noticeable buildup in Pb was attributed mainly to atmospheric loading. (Rowe-Vanderbilt)
W74-11915

MERCURY CONCENTRATIONS IN TISSUES OF FISH FROM THE CONNECTICUT RIVER,
Massachusetts Univ., Amherst.
S. R. DiNardi, K. S. Wisnieski, and E. C. MacDonald.
Journal of Environmental Health, Vol 36, No 6, p 547-551, May/June 1974. 4 tab, 14 ref.

Descriptors: *Mercury, *Fish, *Animal pathology, *Public health, Human pathology, Regulations, Pollution, Testing procedures, Analytical techniques, Spectroscopy, Distribution, *Connecticut River.

The purpose was to evaluate the threat of mercury to fish and to man by determining mercury concentrations of five common species of fish from the Connecticut River; to see if species sampled meet the Food and Drug Administration (FDA) limit of 0.500 ppm of mercury in fish; to find a species that may serve as an index of mercury pollution for surveillance purposes; and to determine if significant differences of mercury occur among the species and tissue sites within species. The five species tested were the American shad, Pumpkinseed, Yellow Perch, Smallmouth Bass, and White Sucker with Rainbow Trout serving as the control. It was concluded that: (1) The quantity of mercury in these species of fish in the Connecticut River currently is not a threat to man; (2) All fish tested were within the FDA standard. The highest sample mean was 0.186 ppm (White Sucker) and the highest individual portion was 0.283; (3) The White sucker, with the highest average concentration, will serve as an index species; (4) This experiment emphasized the importance of taking portions from three axial muscle sites to obtain more stable determinations. When single portions or several portions from one axial muscle site were tested, there were wide variations in results. (Jernigan-Vanderbilt)

HOW MUCH METAL IS THERE IN OUR WATERS,
J. Josephson.
Environmental Science and Technology, Vol 8, No 2, p 112-113, February, 1974, 1 photo.

Descriptors: *Heavy metals, *Bodies of water, *Toxicity, *Conferences, Trace elements, Aquatic life, Public health, Human pathology, Food chains, Mercury, Lead, Cadmium, Regulation, Research priorities.

Research presented at a conference held in December, 1973 in Nashville, Tennessee on heavy metals in the aquatic environment is summarized. Symptoms and incidence of Minamata disease, caused by increased methylmercury intake, and of Itai-Itai disease, caused by increased cadmium intake are covered. The cycling of lead from autos and lead mines and smelters to soils and water can contaminate crops grown nearby. Some concentration of metals is necessary, but setting limits on how much is safe has been difficult due to analytical variations, interactions among various metals and economic considerations. Research needs include studies of tolerance to metals, subclinical and genetic effects, removal methods and time, and transfer mechanisms through food chains. (Eagle-Vanderbilt)
W74-11918

CADMIUM - A TRACE ELEMENT OF CONCERN IN MINING AND MANUFACTURING,
D. B. Cox.
Journal of Environmental Health, Vol 36, No 4, p 361-363, January/February, 1974. 9 ref.

Descriptors: *Cadmium, *Trace elements, *Zinc, *Industrial wastes, *Mining, Public health, Human pathology, Human diseases, Chemical precipitation, Electrolysis, Air pollution, Water pollution, Pesticides, *Path of pollutants.

Cadmium is relatively new to industrialists and chemists. It was discovered in 1817 and is produced entirely as a by-product of zinc production. In the roasting or sintering of zinc concentrates before smelting, cadmium is driven off as an oxide fume to be collected in baghouses or electrostatic precipitators. Here incomplete capture of cadmium oxide results in air pollution. Cadmium is also produced as impure metallic sponge in one of the steps of zinc electrolysis. Improper treatment of the electrolytic solution before release causes water pollution. In the United States the highest air concentrations have been found in Covington, Kentucky, where brass and bronze products are manufactured, and in Chicago, where there is much heavy industry. Cadmium concentration in growing plants is a function of concentration in soil and also is related to pH and the inherent ability of plants to absorb it. The highest concentrations in food are not in plant derived foods, but in shellfish. Hypertension, emphysema and chronic pulmonary disorders are the chief health problems directly attributed to cadmium. (Jernigan-Vanderbilt)
W74-11919

PESTICIDE TRANSPORT AND RUNOFF MODEL FOR AGRICULTURAL LANDS,
Hydrocomp, Inc., Palo Alto, Calif.
N. H. Crawford, and A. S. Donigian, Jr.
Copy available from GPO Sup Doc as EP1.23:660/2-74-013, $2.40; microfiche from NTIS, Springfield, Va 22161 as PB-235 723, PC$4.90/$2.25 MF. Environmental Protection Agency, Technology Series Report EPA-660/2-74-013, December 1973. 211 p, 44 fig, 19 tab, 51 ref, 3 append. EPA Program Element 1BB039. 68-01-0887.

Descriptors: Regulation, *Pesticide drift, *Sediment transport, Mathematical models, *Agricultural runoff, Volatility, *Path of pollutants, *Model studies, Water pollution sources.
Identifiers: *Pesticide transport, Pesticide-soil adsorption.

The development and testing of a mathematical model to simulate the loss of pesticides from agricultural lands are presented. The Pesticide Transport and Runoff (PTR) Model is composed of submodels concerned with hydrology, sediment loss, pesticide-soil interaction, and pesticide attenuation functions. The Model 'piggybacks' the applied pesticide onto the movement of water through the soil profile and the loss of water and sediment from the land surface. The pesticide-soil interaction is based on the Freundlich adsorption-desorption isotherm. Attenuation functions of volatilization and degradation are provided but were not tested due to lack of data. Comparison of simulated and recorded runoff and sediment loss showed considerable agreement. Simulated pesticide loss agreed reasonably well with recorded values for those pesticides completely adsorbed on sediment particles. The Freundlich adsorption model did not accurately predict the division between the adsorbed and dissolved states for those pesticides which are transported by runoff and sediment loss. Recommendations for future work include further calibration and testing of the PTR Model, and additional development on the pesticide adsorption and attenuation functions. The regulation of pesticide releases to the environment is explored as a possible eventual use of the PTR Model. (EPA)

PESTICIDE MOVEMENT FROM CROPLAND INTO LAKE ERIE,
Ohio State Univ., Columbus. Dept. of Entomology.
A. C. Waldron.
Copy available from GPO Sup Doc as EP1.23:660/2-74-032, $1.40; microfiche from NTIS, Springfield, Va 22161 as PB-235 650, $2.25. Environmental Protection Agency, Technology Series Report EPA-660/2-74-032, April 1974. 96 p, 17 tab, 24 ref, 7 append. EPA Project 13020 EBL, RSFD 3256-A1.

Descriptors: *Pesticide residues, Pesticides, Water pollution sources, *Chlorinated hydrocarbon pesticides, *Organophosphorus pesticides, *Insecticides, *Herbicides, Triazine pesticides, DDT, DDD, DDE, Dieldrin, Heptachlor, 2,4-D, 2,4,5-T, Phosphorothioate pesticides, Soil contamination, *Path of pollutants, Lake Erie, Gas chromatography.
Identifiers: Chlorophenoxy acid herbicides, Concentration levels, Atrazine, Dicamba, Heptachlor epoxide, Thimet, Diazinon, Malthion, Parathion, Ethyl parathion, Methyl parathion, Lindane, Methoxychlor, Simazine, Bladex, Phorate.

Gas chromatographic analysis of water and bottom mud sediment samples collected monthly during a one-year period from sites on the Maumee, Portage, Sandusky, Huron, and Grand River systems indicated only very infrequent and sporatic occurrence of minute concentrations of pesticide residues. Samples were analyzed for organochlorine and organophosphate insecticides and for triazine and chlorophenoxy acid herbicides. Concentrations of residues in the few positive analyses were generally less than 10 parts per billion for detected insecticides and less than 50 ppb for triazine herbicide. Diazinon, dieldrin, and the DDT family of compounds were the most common insecticides detected. Atrazine was the most often detected herbicide. An indication of chlorophenoxy and herbicide residue in one water

and one bottom sediment sample was very questionable. The insecticide residues were generally associated with bottom sediment, whereas atrazine was associated with both water and sediment samples. The association of pesticide residues with particular river sites and sampling periods was inconsistent although limited correlation between residue occurrence and the early spring agricultural soil preparation and planting season was observed at one or two sites on two rivers. No valid basis was provided to adequately assess the agricultural versus municipal sources of pesticide contamination. During the period of this study, it appeared that pesticide contamination of northern Ohio rivers was negligible and the contribution to pesticide pollution of Lake Erie was insignificant. (EPA)

ENVIRONMENTAL MONITORING REPORT, PERIOD COVERING MAY 1, 1973 THROUGH JULY 31, 1973 FOR EL PASO NATURAL GAS COMPANY.
Eberline Instrument Corp., Santa Fe, N. Mex. Santa Fe Lab.
Available from NTIS, Springfield, Va., as 22161, as PNE-WW-32; $4/copy; $2.25 microfiche. Report No. PNE-WW-32, 1973. 25 p, 19 tab.

Descriptors: *Monitoring, *Radiation, *Radioisotopes, *Background radiation, Environment, *Water pollution, *Air pollution, *Assay, Evaluation, Soils, Water, Milk, Tritium, Strontium, Cesium, Iodine, Plutonium, Barium, Potable water, Lakes, Streams, Ponds, Vegetation, Precipitation(Atmospheric).
Identifiers: Plowshare program, Urine, Wagon Wheel Project, Big Sandy Reservoir, East Fork River, Fall Creek, Fremont Lake, Green River, New Fork River, Silver Creek, Stock ponds.

The Radiological Monitoring Program for Project Wagon Wheel was initiated in May 1971. The program will continue indefinitely until such time as there is no further need for radiological monitoring. The measurement of background radiation and environmental radioactivity levels is intended to serve the following purposes: (a) To yield average values for radiation levels and concentrations of radioactive materials in various media in the environment. (b) To identify optimum sample locations and/or types of samples that deviate from the averages. (c) To document seasonal variations that could be erroneously interpreted. (d) To indicate the range of values that should be considered 'background' for various types of samples. (e) To 'proof test' the environmental monitoring equipment and procedures. (Houser-ORNL)

ENVIRONMENTAL CONTROL IN NUCLEAR FUEL REPROCESSING,
Emory Univ., Atlanta, Ga.
R. B. Platt, J. M. Palms, H. L. Ragsdale, D. J. Shure, and P. G. Mayer.
Chemical Engineering Progress, Vol 70, No 4, p 87-88, April 1974. 1 fig.

Descriptors: *Monitoring, *Environmental control, *Radioactivity, *Effluents, *Fuels, Background radiation, Ecology, Plants, Animals, Ecosystems, Radioecology, Hydrology, Meteorology, Environmental effects, Measurement, Assessment, Hazards, Warning systems, Model studies, Safety, Evaluation.
Identifiers: *Fuel reprocessing.

An environmental monitoring program was formally initiated in June 1970, by the formulation of a set of objectives by Barnwell Nuclear Fuel Reprocessing Plant (BNFP) personnel. These objectives were tougher and asked more penetrating questions than were then being used for the nuclear industry. Therefore, by their very nature, they required greater comprehension and depth than existed at that time for development of monitoring procedures. To achieve the objectives, close interaction was required and an interdisciplinary team which would collectively represent competence in plant and animal radiation ecology, hydrology, meteorology, radionuclide measurement and evaluation, and ecosystem modeling and analysis. Accordingly, a University-based team was organized in August 1970. (Houser-ORNL)

ENVIRONMENTAL MONITORING AT THE PACIFIC NORTHWEST LABORATORY BY BATTELLE-NORTHWEST,
Battelle-Pacific Northwest Labs., Richland, Wash. Occupational and Environmental Safety Dept.
J. P. Corley.
Available from NTIS, Springfield, Va., 22161 as Report No. BNWL-SA-4839; $4/copy, $2.25 microfiche. From: 66th Annual Meeting of the American Institute of Chemical Engineers; Philadelphia, Pennsylvania, Nov. 11, 1973 (CONF-731109-2), Report BNWL-SA-4839, Oct. 1973. 21 p, 6 fig, 5 tab, 5 ref.

Descriptors: *Monitoring, *Radioactivity, *Sites, *Nuclear powerplants, *Effluents, *Columbia River, Water pollution, Path of pollutants, Water, Milk, Food chains, Vegetation, Fish, Soil, Diets, Groundwater, Potable water, Public health.
Identifiers: Hanford Site.

The surveillance program for radioactivity at the Hanford site generally follows the guides established by the International Commission on Radiological Protection and are enumerated as follows: (A) Detection of sudden changes and evaluation of long-term trends of concentrations in the environment, with the intent to detect failure or lack of adequate control of releases and to initiate appropriate actions. (B) Assessment of the actual or potential exposure of man to radioactive materials or radiation present in his environment, or the estimation of the probable upper limits of such exposure. (C) Determination of the fate of contaminants released to the environment, especially with the intent of detecting previously unconsidered mechanisms of exposure. (D) Demonstration of compliance with applicable regulations and legal requirements concerning releases to the environment. The program described meets the objectives listed. To detect trends, to estimate the contribution of plant effluents to the radiation dose received by the local population, and to demonstrate compliance with applicable regulations. Flexibility within appropriate cost controls has permitted needed response to changing plant operations and environmental conditions. (Houser-ORNL)

M. Zaduban.
Soviet Atomic Energy, Vol 34, No 5, p 460-464, 1973, 3 fig, 2 tab, 14 ref. Translated from Atomnaya Energ'ya, Vol 34, No 5, p 376-380, May 1973.

Descriptors: *Nuclear powerplants, *Ecology, *Ecosystems, *Environmental effects, Water pollution, Rivers, Waste disposal, Effluents, Uranium, Thorium, Food chains, Public health, Economics, Elements(Chemical), Radioisotopes, Oceans.
Identifiers: *Danube River.

Attention is drawn to factors which accompany the development of nuclear power and produce an effect on the environment. Using the desirable and undesirable features of the development of nuclear power as a basis, mankind can and must set up the proper conditions for its peaceful 'coexistence' with the biosphere. At the same time, it is essential to formulate criteria for an assessment of such coexistence, taking account of economics and of natural laws. In ecological investigations there is a progression from an individual to a population, then to a biocenosis, to an ecosystem, to the environment, and finally to the biosphere. In contrast to this, in investigation is enlarged by the addition of a source of unstable nuclides. The purpose of radioecology is a comprehensive investigation of biospheric processes in which natural and artificial nuclides take part, their relationship to the environment and to the food chains of mankind, animals, and plants, and also the possibility of modifying these processes. Man's productive activity must follow certain fundamental laws of nature and human society and the requirements of economic expediency. (Houser-ORNL)

RATIO OF CS-137 -- SR-90 IN OCEAN AND SEA WATER,
Gosudarstvennyi Komitet po Ispolzovaniyu Atomnoi Energii SSSR, Moscow.
A. G. Trusov, L. M. Ivanova, and L. I. Gedeonov.
Soviet Atomic Energy, Vol 34, No 5, p 481-482, May 1973. Translated from Atomnaya Energiya, Vol 34, No 5, p 394, May 1973.

Descriptors: *Radioisotopes, *Strontium, *Cesium, Bodies of water, Oceans, Seas, Biocontrol, *Path of pollutants, Hazards, Analysis, Radioactivity, Aquatic environment, Distribution, Distribution patterns, Chemical properties, Physical properties, Analytical techniques, Assay, Sampling.

Among the artificial radioisotopes that precipitate into the sea medium, the greatest biological hazard is Sr-90 and Cs-137. To determine the pathways of the spread of these radioisotopes in the aqueous medium and to predict their further distribution, it is necessary to know in what state they penetrate into sea water, and in what state they exist in it. The Sr-90 and Cs-137 that have penetrated into the ocean water are in such a degree of dilution that it is difficult to find a direct method of determining their physical state and chemical forms. Valuable information in this respect can be obtained from data on the ratio of the concentrations of Cs-137 and Sr-90 in sea water. Results are discussed of a large number of simultaneous determinations of Cs-137 and Sr-90, performed since 1963 and ac-

cording to the same method, as well as the results of analyses of samples of sea water, collected on the 20th voyage of the scientific research ship 'M. Lomonosov' and in the first and second voyages of the scientific research ship 'Akademik Vernadskii' for surface waters, waters from intermediate layers and from great depths. (Houser-ORNL)

AERIAL RADIOLOGICAL MEASURING SURVEY OF THE AREA SURROUNDING THE HALLAM NUCLEAR POWER FAVILITY, HALLAM, NEBRASKA, SEPTEMBER 20, 1968.
EG G, Inc., Las Vegas, Nev.
Available from NTIS, Springfield, Va., 22161 as Rept. No. ARMS-68-6-7. $4/copy, $2.25/microfiche. Atomic Energy Commission, Report No. ARMS-68-6-7, May 1974. 18 p, 3 fig, 3 tab, 3 ref.

Descriptors: *Monitoring, *Nuclear powerplants, Effluents, *Surveys, *Radioactivity, Instrumentation, Nuclear wastes, Remote sensing, Public health, Background radiation, Radioisotopes, *Nebraska.

The Aerial Radiological Measuring System (ARMS) was used to survey the area surrounding the Hallam Nuclear Power Facility during September 1968, four years after reactor shutdown. The survey measured terrestial gamma radiation with special emphasis given to instrumentation. A high-sensitivity detection system collected gamma-ray spectral and gross-count data. The data were then computer processed into a map of a 200 square mile area showing isoexposure contours three feet above the ground. Exposure rates and isotopes identified are consistent with normal terrestrial background. (Houser-ORNL)

EFFECTS OF SEPTIC TANK EFFLUENT ON GROUNDWATER QUALITY, DADE COUNTY, FLORIDA: AN INTERIM REPORT,
Geological Survey, Tallahassee, Fla.
W. A. J. Pitt, Jr.
Open-file report 74010, 1974. 79 p, 17 fig, 10 tab, 7 ref, append.

Descriptors: *Septic tanks, *Path of pollutants, *Florida, *Water pollution effects, Sampling, Water quality, Groundwater, Soil disposal fields, Coliforms.
Identifiers: *Dade County(FL).

At each of five sites in Dade County, Florida, where septic tanks have been in operation for at least 15 years and where septic tank concentration is less than 5 per acre, a drainfield site was investigated to determine the effects of septic tank effluent on the quality of the water in the Biscayne Aquifer. At each site two sets of multiple depth wells were drilled. The upgradient wells were constructed in such a way that the aquifer could be sampled at 10, 20, 30, 40, and 60 feet below land surface. The downgradient wells are 35 feet or more from the upgradient wells in the direction of groundwater flow, and also allow the aquifer to be sampled at various depths. Except at one site, no fecal coliforms were found below the 10-foot depth. Total coliforms exceeded a count of one colony per ml at the 60-foot depth at two sites. At one site a fecal streptococci count of 53 colonies per ml was found at the 60-foot depth and at another a count of seven colonies was found at the 40-foot depth. The three types of bacteria occur in higher concentration in the northern areas of the county than in the south. Bacteria concentrations were also higher where the septic tanks were more concentrated. (Knapp-USGS)

DOCUMENTATION FOR SNSIM1/2, A COMPUTER PROGRAM FOR THE STEADY-STATE WATER QUALITY SIMULATION OF A STREAM NETWORK,
Environmental Protection Agency, New York. Data Systems Branch.
R. E. Braster, and S. C. Chapra.
Available from NTIS, Springfield, Va 22161 as PB-227 159, Price $3.25 printed copy; $2.25 microfiche. September 5, 1973. Second edition. 43 p, 2 fig, 4 ref, 2 append.

Descriptors: *Path of pollutants, *Mathematical models, *Computer programs, Water pollution sources, Water pollution effects, Simulation analysis, Dissolved oxygen, Oxygen demand, Biochemical oxygen demand.

A mathematical model was written to determine the levels of dissolved oxygen (DO), carbonaceous biochemical oxygen demand (CBOD), and nitrogenous biochemical oxygen demand (NBOD) in a stream. It was designed to evaluate and predict the dissolved oxygen, and the carbonaceous and nitrogenous BOD profiles in a river or stream where the effects of dispersion can be assumed to be insignificant. The stream network consists of a river and its tributaries which are segmented into sections of constant hydrologic, physical, chemical and biological parameters. Loads may be applied pointwise at the ends of the section or as distributed sources along its length. (Knapp-USGS)

MICROBIAL DEGRADATION OF DDT,
Cornell Univ., Ithaca, N.Y. Dept. of Agronomy.
M. Alexander.
Available from NTIS, Springfield, Va 22161 as AD-762 469, Price $3.00 printed copy; $2.25 microfiche. Annual Report No 1, July 1, 1973. 24 p, 3 fig, 4 tab, 24 ref. ONR Contract N00014-67-A-0077-0027.

Descriptors: *DDT, *Biodegradation, *Marine bacteria, Aquatic bacteria, Path of pollutants, *Pesticide residues, *Water pollution control, Water quality, Aquatic fungi, Marine fungi.

Marine bacteria were tested for their ability to degrade DDT. Forty-seven converted 5% to 10% of the DDT to water-soluble products, 38 solubilized less than 5% of the insecticide, and 29 were apparently inactive. Mucor alternans, a fungus exceptionally active in producing water-soluble metabolites from DDT, was used as a model for determining the identities of the water-soluble metabolites. Although these compounds have not yet been identified, they are not DDT, DDA, DBH, DBP, PCPA, or 2-chlorosuccinic acid. (Knapp-USGS)

A NETWORK FOR CONTINUOUS MONITORING OF WATER QUALITY IN THE TRINITY RIVER BASIN, TEXAS,
Geological Survey, Austin, Tex.
J. F. Blakey, and P. W. Skinner.
Open-file report, May 1974. 26 p, 1 fig, 3 tab, 1 ref, 2 append.

Descriptors: *Monitoring, *Water quality, *Telemetry, *Data collections, *Texas, Equipment, Water pollution, Instrumentation, Data transmission, Rivers.
Identifiers: *Trinity River Basin(TX).

A continuous water-quality monitoring network is recommended for the Trinity River basin, Texas. Equipment, installation, operation, maintenance, and cost considerations are described for continuous measurement, recording, and transmission of data to central receiving stations. The data produced by the network can be obtained by any party installing a receiving station. The basic set of water-quality parameters recommended for the network includes dissolved oxygen, temperature, pH, and specific conductance. For illustration, seven possible monitoring stations, one central-control, and one slave-central station are considered in detail. The total costs for constructing the network is estimated at $192,670. The costs for operation and maintenance of the network is estimated at $82,700 per year. Records collected at permanent locations would be supplemented by data collected with one or more mobile monitors. (Knapp-USGS)

EFFECTS OF SALT MARSH IMPOUNDMENTS ON MOSQUITO POPULATIONS,
North Carolina State Univ., Raleigh. Dept. of Entomology.
R. N. LaSalle, and K. L. Knight.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-235 264; $4.00 in paper copy, $2.25 in microfiche. North Carolina Water Resources Research Institute, Raleigh, Partial Completion Report No 92, (UNC-WRRI-74-92), April 1974. 85 p, 20 fig, 34 tab, 19 ref, append. OWRTB-057-NC(1). 14-31-0001-3919.

Descriptors: *Salt marshes, *North Carolina, *Marsh management, Impoundments, *Mosquitoes, Wetlands, Environmental effects.
Identifiers: Carteret County(NC), Pamlico County(NC), Anopheles bradleyi, Anopheles atropos, Culex salinarias, Juncas roemerianus, *Mosquito control.

Four impoundments constructed in salt marshes in coastal North Carolina were studied to determine their effects on mosquito production, primarily Aedes taeniorhynchus (Weidemann), A. sollicitans (Walker), Anopheles bradleyi King, An. atropos Dyar and Knab and Culex salinarius Coquillett. Effects of impoundments on vegetation were also observed. Large patches of Distichlis spicata (L.) and Spartina patens (Aiton) interspersed throughout the unimpounded marsh dominated by Juncus roemerianus Scheele (Black Needlerush) were often eliminated after installation of an impoundment. J. roemerianus was, in most cases, also destroyed after flooding, remaining in the impoundment in large dead stands. Ruppia maritima L., or widgeon grass was the dominant plant species in one impoundment. Impoundments were effective in reducing mosquitoes, especially Aedes species, provided proper management of impoundments is practiced including maintenance of minimum depths (12 inches or more), control of emergent vegetation, provision of top water minnows, and maintenance of dikes. At water depths greater than one foot, vegetation was submerged and/or dispersed sufficiently to eliminate the conditions conducive to Anopheles and Culex breeding. (McJunkin-North Carolina State)

LETHAL RESPONSE BY ATLANTIC SALMON PARR. TO SOME POLYOXYETHYLATED CATIONIC AND NONIONIC SURFACTANTS,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
D. J. Wildish.
Water Research, Vol 8, No 7, p 433-437, 1974. 2 fig, 5 tab, 12 ref.

Descriptors: *Lethal limit, *Surfactants, *Atlantic salmon, Toxicity, Animal physiology, Bioassay, Methodology, Cations, Salmon, Chemical properties, Chemical reactions, Biological membranes, Lipids, Water pollution effects.
Identifiers: *Lethal response, *Polyoxyethylated surfactant, *Salmo salar, Oil dispersants, Lauric acid, Parr, Detoxification.

Lethal response of Atlantic salmon parr, as 96-h LC50, is semi-logarithmically related to the number of moles of ethylene oxide in the polyoxyethylated surfactant. 96-h LC50 of polyoxyethylene (10) monolaurate = 7.5 mg/1, polyoxyethylene (10 lauryl ether = 3.5 mg/1, and polyoxyethylene (10) octadecyl amine = 0.2 mg/1. Evidence is presented which suggests that polyoxyethylene esters with up to 18-20 moles of ethylene oxide are partially detoxified in the animal, resulting in changes in lethal response. Possible physiological explanations for the relationship between polyoxyethylene chain length and lethality involve uptake rates and attainment of a critical concentration of surfactant at the unknown active site. (Katz)

LONG-TERM CHANGES IN THE PLANKTON OF EUTROPHIC MIKOLAJSKIE LAKE AS AN EFFECT OF ACCELERATED EUTROPHICATION,
Polish Academy of Sciences, Warsaw. Inst. of Ecology.
I. Spodniewska, A. Hillbricht-Ilkowska, and T. Weglenska.
Bull Acad Pol Sci Ser Sci Biol. vol 21, No 3, p 215-221. 1973, Illus.

Descriptors: *Eutrophication, *Phytoplankton, Lakes, Biomass, Rotifers.
Identifiers: Mikolajskie Lake, Poland.

Seasonal changes were studied in the phytoplankton biomass and production as well as in zooplankton abundance in eutrophic Mikolajskie Lake (Poland) during 1963-1970. The increase in the biomass of phytoplankton was recorded in summer as well as the increase in crustacean and rotifer abundance and size of individuals. These changes seem to be the effects of accelerated eutrophication of the lake.--Copyright 1974, Biological Abstracts, Inc.

LETHALITY AND BEHAVIORAL SYMPTOMS PRODUCED BY SOME ORGANOPHOSPHOROUS COMPOUNDS IN THE SNAIL (HELIX ASPERSA),
Carleton Univ., Ottawa (Ontario). Dept. of Biology.
M. A. Rorke, D. R. Gardner, and R. Greenhalgh.
Bulletin of Environmental Contamination and Toxicology, Vol 11, No 5, p 417-424, 1974. 3 tab, 15 ref.

Descriptors: *Organophosphorus compounds, *Snails, *Carbamate pesticides, Inhibitors, Enzymes, Organophosphorus pesticides, Organic compounds, Organic pesticides, Toxicity, *Behavior, Animal physiology, Biochemistry, Methodology, Lethal limit, Water pollution effects.
Identifiers: *Cholinesterase, *Helix aspersa, Fenitrothion, Fenitro-oxon, Diethylphenylphosphate, Physostigmine sulphate.

The effects of organophosphorus compounds and the carbamate, physostigmine sulphate, on the snail are investigated. Experimental solutions were applied directly to the foot of the snail; behavior was observed at intervals and LD50 was determined. Two distinct types of behavior were observed suggesting that fenitrothion, fenitro-oxon and diethylphenylphosphate (DEPP) have a common characteristic effect that is not associated with cholinesterase inhibition. Physostigmine produced behavior attributed to cholinesterase inhibition. (Katz)

THE IN VIVO EFFECT OF P,P' DDT ON NA+-K+-ACTIVATED ATPASE ACTIVITY IN RAINBOW TROUT (SALMO GAIRDNERI),
Idaho State Univ., Pocatello. Dept. of Biology.
R. D. Campbell, T. P. Leadem, and D. E. Johnson.
Bulletin of Environmental Contamination and Toxicology, Vol 11, No 5, p 425-428, 1974. 1 tab, 7 ref.

Descriptors: *DDT, *Rainbow trout, *Salinity, Enzymes, Animal physiology, Biochemistry, Inhibitors, Trout, Pesticides, Laboratory tests, Insecticide, Water pollution effects.
Identifiers: *Na+-K+-ATPase, In vivo tests, Kidney, Gill.

Trout kept in three different salinities were administered DDT in two different concentrations in order to determine the effect of p,p' DDT on Na+, K+-ATPase activity. A relationship between salinity and a propensity for inhibition of the enzyme activity seemed probable in branchial enzyme activity but not in renal enzyme activity. It may be concluded that DDT is capable of inhibiting Na+, K+-ATPase activities in tissues of chronically exposed rainbow trout. Pesticide-salinity interactions exist which are of importance to fish which must adapt to waters of different salinities. (Katz)
W74-11485

SHORT-TERM EFFECTS OF ORGANOPHOSPHATE PESTICIDES ON CHOLINESTERASES OF ESTUARINE FISHES AND PINK SHRIMP,
Environmental Protection Agency, Gulf Breeze, Fla. Gulf Breeze Environmental Research Lab.
D. L. Coppage, and E. Matthews.
Bulletin of Environmental Contamination and Toxicology, Vol 11, No 5, p 483-488, 1974. 1 tab, 28 ref.

Descriptors: *Organophosphorous compounds, *Pink shrimp, Inhibitors, Shrimp, Minnow, Lethal limit, Enzymes, Biochemistry, Animal physiology, Toxicity, Poisons, Pesticides, Insecticides, Bioassay, Methodology, Water pollution effects.
Identifiers: *Cholinesterases, Malathion, Parathion, Croaker, Spot, Pinfish, Acetylcholinesterase, Enzyme activity, Naled, Guthion, *Organophosphate pesticides.

Four species of estuarine fish and pink shrimp were subjected to short-term exposures of organophosphate pesticides in order to determine the effects on acetylcholinesterase (AChE). Survivors of near median fishkills were assayed for AChE inhibition. Consistent levels of AChE reductions of 70-96% were found, even with different compounds and species. The 'lethal threshold' was found to vary in different species, up to about 80% reduction in AChE activity. Results indicate that measurements of AChE activity and residue analysis woul be useful in determining the cause of 'kills' in the environment. (Katz)

METHOD FOR INDIRECTLY DEFINING OPTIMUM TEMPERATURES OF INHABITANCY FOR MARINE COLD-BLOODED ANIMALS,
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Institut.
A. N. Golikov, and O. A. Scarlato.
Marine Biology, Vol 20, No 1, p 1-5, 1973. 1 fig, 1 tab, 22 ref.

Descriptors: *Temperature, *Mollusks, *Distribution, Aquatic animals, Water temperature, Reproduction, Resistance, Seasonal, Analytical techniques, Mathematical studies, Temperate, *Inhibition, Thermal pollution.
Identifiers: Optimum temperature, Poikilotherm, Collisella ssp., Cold water.

The temperature conditions of existence were analyzed for 7 biogeographical groups of coastal mollusks near the peripheries of their distributional areas. A method is suggested for defining optimum temperatures of inhabitancy and temperatures of reproduction for marine poikilotherm animals. In the Northern Hemisphere, minimum winter temperatures in the North of the distributional areas and maximum summer temperatures in the South often restrict further expansion. The thermal range between summer temperatures in the North of the areas and winter temperatures in the South favors successful reproduction and approaches optimum conditions. The ranges of optimum temperatures of inhabitancy calculated and the temperatures of reproduction are in agreement with data on the spawning temperatures of the same species reported in literature. EFFECT OF BLACKFLY LARVICIDING IN SOME ADIRONDACK STREAMS,
New York State Dept. of Environmental Conservation, Albany.
G. E. Burdick, H. J. Dean, J. C. Skea, and C. N. Frisa.
New York Fish and Game Journal, Vol 21, No 1, p 1-17, 1974. 6 tab, 11 ref.

Descriptors: *Insecticides, *Larvicides, *DDT, Insect control, Pesticides, Diptera, Invertebrates, Mayflies, Stoneflies, Benthic fauna, Sampling, Methodology, Statistical models, *New York, Water pollution effects.

Identifiers: *Blackfly, *Arthropods, *Methoxychlor, Trichoptera, Adironduck, Schroon River.

The effect on other stream arthropods of aerial spraying with DDT and methoxychlor for blackfly control was studied on several Adirondack streams, primarily in the Schroon River watershed. Samples were taken from the stream bottom before and at intervals after treatment, and live specimens were recorded and preserved. Weight of the organisms was used as the basis of comparison. A method of comparing all samples to May (first post-treatment samples) weights was devised. The data showed that both DDT (as a 20% solution) and methoxychlor (as a 15% solution) had a significant effect on arthropods other than blackflies in the streams studied. A great reduction in stream productivity was found. (Katz)
W74-11489

ACCUMULATION AND DEPURATION OF MERCURY IN THE AMERICAN OYSTER CRASSOSTREA VIRGINICA,
Delaware, Univ. Dept. of Biological Sciences. Newark.
P. A. Cunningham, and M. R. Tripp.
Marine Biology, Vol 20, No 1, p 14-19, 1973. 3 fig, 2 tab, 14 ref.

Descriptors: *Mercury, *Oysters, *Kinetics, Absorption, Molluscs, Heavy metals, Metals, Bioassay, Analytical techniques, Spectroscopy, Laboratory tests, Statistical methods, Methodology, Pollutants, Water pollution effects.
Identifiers: *Crassostrea virginica, Accumulation, Depuration.

To study the kinetics of mercury uptake in oysters, adult Crassostrea virginica were held in seawater containing 10 microgram/l (ppb) or 100 microgram/l (ppb) mercury as mercuric acetate, for 60 days. Mercury concentration in tissues was determined by analysis of individually homogenized oyster meats, using wet digestion and flameless absorption spectroscopy. After 45 days, average mercury tissue concentration was 140,000 microgram mercury/kg tissue and 28,000 microgram mercury/kg tissue in the 100 ppb and 10 ppb groups, respectively. Clearance of mercury from tissue was studied by exposing treated adults to estuarine water for 30 days (100 ppb group) and 160 days (10 ppb group). Tissue concentrations in the 100 ppb group declined from 115,000 to 65,000 ppb and those from the 10 ppb group declined from 18,000 to 15,000 ppb, in 8 days. No further decline occured in either group. Total self-purification was not achieved over a 6 month cleansing period. (Katz)
W74-11490

EFFECTS OF COPPER AND CADMIUM ON OSMOREGULATION AND OXYGEN CONSUMPTION IN TWO SPECIES OF ESTUARINE CRABS,
National Marine Fisheries Service, Milford Conn. Middle Atlantic Coastal Fisheries Center.
F. P. Thurberg, M. A. Dawson, and R. S. Collier.
Marine Biology, Vol 23, No 3, p 171-175, 1973. 6 fig, 26 ref.

Descriptors: *Crabs, *Copper, *Cadmium, *Oxygen, *Osmosis, Crustaceans, Copper compounds, Salinities, Osmotic pressure, Heavy metals, Metals, Absorption, Laboratory studies, Analytic techniques, Water pollution effects.
Identifiers: *Carcinus maenas, *Cancer irroratus, *Blood serum osmolality, Oxygen consumption.

Green crabs (Carcinus maenas) and rock crabs (Cancer irroratus) were exposed to various concentrations of copper as cupric chloride (CuC12.2H20) and cadmium as cadmium chloride (CdC12.21/2H20) for 48 h. The exposures were conducted at 5 different salinities. At the end of each exposure period, tests of blood-serum osmolality and gill-tissue oxygen consumption were performed. Copper-exposed crabs exhibited loss of osmoregulatory function with increasing copper concentration until normally hyperosmotic serum became isosmotic with the surrounding medium. Cadmium elevated green crab serum above its normal hyperosmotic state. Copper had no effect on gill-tissue oxygen consumption; however, cadmium reduced the role of oxygen consumption in both species tested. (Katz)
W74-11491

ECOLOGICAL IMPACT OF THE IN-LINE ARRANGEMENT OF TWO RESERVOIRS AND A METROPOLITAN AREA,
Drake Univ., Des Moines, Iowa,
W. B. Merkley.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-235 340, $3.75 in paper copy, $2.25 in microfiche. Iowa Water Resources Research Institute, Ames, Completion Report ISWRRI-53, July 1974. 59 p, 17 fig, 5 tab, 33 ref. OWRT A-045-IA(4), 14-31-001-3815, 14-31-001-3515.

Descriptors: *Invertebrates, Water quality, Ecology, Reservoirs, Urbanization, Rivers, Streams, *Iowa, *Biomass, *Productivity, *Ecological distribution, Systematics, Benthic fauna, *Caddisfilies, *Aquatic insects, Eutropluication.
Identifiers: *Des Moines River(IA), Red Rock Reservoir(IA), Saylorville Reservoir(IA), *Species diversity analysis.

The Army Corps of Engineers is in the final stages of a three phase flood control project on the Des Moines River. When it is completed, the project will consist of two large main stream dams on either side of the city of Des Moines. Among the efforts to assess the ecological impact of this arrangement is an evaluation of the macroinvertebrate community. This evaluation includes: (1) an examination of the structure of the community, (2) biomass and productivity estimates, and (3) species diversity analysis. Invertebrate samples were taken from stations above and below the city and the reservoir using a float device from which were suspended barbeque baskets containing 10 concrete spheres. Comparisons of the stations below the reservoir with those above showed the following differences: (1) a decrease in the number of taxa (from an average of 13 taxa above to 6 below), (2) a decrease in the number of specimens (from an average of 7370/m2 to 3970/m2), (3) a change in the predominant taxa from a caddisfly-mayfly-dipteran assemblage above to an almost complete caddisfly predominance below the reservoir, (4) a remarkably stable annual production estimate (261 g/m2/yr above and 256 g/m2/yr below), and (5) a drop in the average D value from 2.13 above to 1.39 below the reservoir. Collectively the data suggest that there is a gradual degradation of the water quality as it moves to and through the metropolitan area and that the reservoir affects the downstream station such that the stream acts as though it had been exposed to moderate organic enrichment.
W74-11571

AN INVESTIGATION INTO THE EXTENT AND CAUSE OF EUTROPHICATION IN CANYON FERRY RESERVOIR, MONTANA,
Montana Univ., Bozeman. Joint Water Resources Research Center.
J. C. Wright, A. R. Rada, and C. Martin.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-235 337, $3.25 in paper copy, $2.25 in microfiche. Report No 50 (1974). 35 p, 1 fig, 13 tab, 12 ref. OWRT A-055-MONT(1).

Descriptors: *Eutrophication, *Montana, *Reservoirs, Phosphates, Nitrogen, Daphnia, Cyanophyta, Agricultural watersheds, Zooplankton, Herbivores, Productivity, Phytoplankton, Nutrients, Temperature, Light, Standing crops, Chlorophyll, Influent streams, Effluent streams, Missouri River.
Identifiers: *Canyon Ferry Reservoir(MT), Townsend Valley(MT).

To determine if Canyon Ferry Reservoir has become more productive since 1956-1958, influent and effluent Missouri River water and reservoir water were sampled for nutrients. Streams and reservoir temperatures, light penetration, chemical properties, and phytoplankton standing crop, chlorophyll, zooplankton, and hydrology were also measured. In a comparison to earlier baseline data the 1971-1972 total cell volume, diatom cell volume and Cryptomonad cell volume were less than in 1958. Phosphate concentrations were the lowest observed. Light extinction and blue-green algal cell volume were comparable to 1958 values. Algal bloom concentrations were observed nine times in 1957, three times in 1958 but only once in 1971 and 1972. The areal hypolimnetic oxygen deficit was greater in 1957-58 than in 1971-72. Little difference in zooplankton standing crops was evident in the four years except that the maximal Daphina populations were greater in 1971 and 1972 than in 1957-1958. It is probable that the 1957 conditions reflected the assimilation of terrestrial organic matter following impoundment while the 1958 data may have reflected a transition to a stable state. The indications are that the reservoir was less eutrophic in 1971 and 1972 and the present steady state level of biological productivity should continue during its life. (Auen-Wisconsin)

DAMAGE ASSESSMENT OF HOUSEHOLD WATER QUALITY,
Environmental Protection Agency, Washington, D.C. Office of Research and Development.
D. P. Tihansky.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 100, No EE4, Proceedings paper No 10700, p 905-918, August 1974. 7 fig, 1 tab, 32 ref.

Descriptors: *Damages, *Assessments, *Economics, *Environmental engineering, *Water quality control, *Water supply, Estimating, Methodology, River basins, Groundwater, Systems analysis, Equations.
Identifiers: Housing, Households, Mineralized water, Damage functions.

A quantitative method is presented for estimating typical household damages (pecuniary) resulting from mineralized water supply use. The literature is reviewed, and economic data on damages are compiled. For a typical family residence, damages are expressed as the sum of yearly capital expenditures and operation, maintenace, and repair costs for items affected by water use. Nearly 20 household items are assessed, including appliances, water distribution systems, washable

clothing, and soap purchases. Equations are formulated from published data to estimate damages, after which they are depicted graphically for subsequent use by water resource planners. The results are illustrated mathematically as a set of functions defined over various water quality levels. Damage estimates per household are calculated for each state, the relative magnitudes implying that minerals control is likely to achieve its greatest benefits in the midwest and southwest. The contributing role of man's activities to mineral loads in natural bodies is an important factor in setting water quality standards. Economic benefit analyses of pollution control are necessary to insure that future water quality standards improve or enhance social welfare. (Bell-Cornell)

EXPERIMENTAL INVESTIGATIONS ON THE ACCUMULATION OF MERCURY IN WATER ORGANISMS,
National Nature Conservancy Board, Drottningholm (Sweden).
L. Hannerz.
In: Board Report No 48, p 120-176, 1968. 21 fig, 17 tab, 12 ref.

Descriptors: *Absorption, *Model studies, *Aquatic environment, *Mercury, Chemistry, Aquatic plants, Invertebrates, Fish, Metabolism, Food chains, Water pollution, Organic compounds, Testing, Laboratory studies, Radioisotopes, Distribution, Sediments.

The accumulation of methyl mercuric hydroxide, phenyl mercuric acetate, methoxyethyl mercuric hydroxide, mercuric chloride and mercuric nitrate in water organisms was studied with the aid of labelled compounds in pond, tank, and aquarium experiments. Although none of the compounds was taken up to any appreciable degree in the tissues of water plants, the considerable surface adsorption can cause high concentrations in submerged plants. The concentration in animals seemed to be related to several factors including metabolic rate and feeding habits. The concentrations of mercury in invertebrates varied, being highest with methyl mercury and lowest with mercuric chloride. The sediment always had high concentrations, showing a tendency of the mercury towards adsorption on and sedimentation with particles in the pond water. All mercury compounds were taken up in fish both directly from the water and from food. Since uptake greatly exceeded excretion rates large concentrations were found, particularly in the kidneys and liver of the fish. The concentration of electrolytes in the water exerted an influence on the accumulation, and uptake was lower in brackish water than in salt water. (Jerome-Vanderbilt)

HEALTH HAZARDS OF LEAD.
Environmental Reporter: Federal Laws, Sec 31, p 2641-2648, 1972. 7 tab, 62 ref.

Descriptors: *Lead, *Public health, *Human pathology, Toxins, *Air pollution effects, Gasoline, Pollutants, Water pollution sources, Foods.

Sources, occurrence, expected exposure and health effects of lead are discussed. Though the amounts of lead ingested in food and water generally are greater than the amounts inhaled, the body absorbs a greater percentage of inhaled lead (greater than or equal to 30%) than of ingested lead (about 10%). Human blood lead levels are most frequently used as an index of human exposure. The levels begin to rise appreciably with exposure to airborne lead concentrations in excess of 2 micrograms per cubic meter and elevated intake for periods as short as three months produces an increase in blood lead levels. Levels are higher among urban residents and certain occupational groups. The activity of certain enzymes involved in heme synthesis is inhibited when blood levels exceed 40 micrograms/100gm. The clinical manifestations of lead poisoning include combinations of anemia, acute abdominal colic, acute and chronic encephalopathy, peripheral and chronic neuropathy. The syndromes of acute lead poisoning usually resolve following cessation of the exposure to lead and institution of therapy. However, acute encephalopathy in young children is followed by permanent neurological sequelae in at least 25% of the cases. (Jernigan-Vanderbilt)

ALGAL ECOLOGY OF A STREAM POLLUTED THROUGH GOLD MINING ON THE WITWATERSRAND,
University of the Witwatersrand, Johannesburg (South Africa). Dept. of Botany.
F. D. Hancock.
Hydrobiologia, Vol 43, Nos 1-2, p 189-229, 1973. 9 fig, 4 tab, 26 ref, 2 append.

Descriptors: *Mining, *Gold, *Mine drainage, *Algae, *Water pollution, Mine wastes, Streams, Pyrite, Sewage effluents, Sampling, On-site data collections, Laboratory tests, Flow characteristics, Turbidity.
Identifiers: *South Africa(Witwatersrand).

Algal populations of a High Veld stream are examined against the background of mineral and acid pollution derived from sand-dumps and slimes-dams consequent on the gold-mining industry of the Witwatersrand. A rich flora of filamentous Conjugales, desmids and diatoms is found in the originating springs of the Witwatersrand Quartzites. Pollution from sand-dumps raises ionic content and pH and results in the production of only a few tolerant species of diatoms and unicellular chlorophytes which may occur in high numbers. Pollution from slimes-dams is lethal to life in the water. Recovery is initiated by a rise in pH which is brought about by: dilution due to influent water; the lithology of the stream bed changing to that of dolomite limestone and the complete covering of the upper middle reaches by the immense growth of Phragmites communis and other semiaquatics, this, by slowing down the flow of water, enables neutralization and other chemical interactions to take place, sedimentation to be increased and bacterial activity to take place. Pioneer aquatics such a Potamogeton pusillus L. play an important part in creating a micro habitat in which algae can develop. Turbidity at the mouth again prevents the development of algal populations. (Jernigan-Vanderbilt)

TOXICITY FOR CATS OF METHYLMERCURY IN CONTAMINATED FISH FROM SWEDISH LAKES AND OF METHYL-MERCURY HYDROXIDE ADDED TO FISH,
Research Inst. of National Defense, Sundbyberg (Sweden). Dept. of Pathology.
L. Albanus, L. Frankenberg, C. Grant, U. VonHaartman, and A. Jernelov.
Environmental Research, Vol 5, No 4, p 425-442, December, 1972. 2 fig, 8 tab, 34 ref.

Descriptors: *Path of pollutants, *Mercury, *Metabolism, *Animal pathology, *Toxicity, Diets, Water pollution, Pollutants, Biochemistry, Animal physiology, Analytical techniques, Mammals, Furbearers, Laboratory tests, Fish.
Identifiers: *Methylmercury, Cats.

The object was to ascertain whether the methylmercury found in contaminated fish was toxicologically equivalent to a comparable amount of methylmercury salts. Fifteen cats were divided into three groups. The first two were fed a homogenate of pike from a contaminated lake and methylmercury salts added to fish homogenate, respectively at concentrations of 6mg Hg/kg. The third group was used as a control. The exposure period to clinical onset of methylmercury poisoning for both test groups was 60-83 days, with similar neuropathological patterns obvious in both. More than 90% of the mercury was absorbed, of which at least 20% was incorporated into the hair. Mercury levels in the brain constituted about 1% of the total body burden (excluding fur). In the brain and muscle 100% of the mercury was recovered as methylmercury. The results demonstrate that toxicity studies with simple methylmercury salts give results comparable with those obtained with methylmercury naturally accumulated in fish. (Jerome-Vanderbilt)

EFFECT OF MOLYBDENUM STARVATION AND TUNGSTEN ON THE SYNTHESIS OF NITROGENASE COMPONENTS IN KLEBSIELLA PNEUMONIAE,
Wisconsin Univ., Madison. Dept. of Bacteriology.
W. J. Brill, A. L. Steiner, and V. K. Shah.

Journal of Bacteriology, Vol 118, No 3, p 986-989, June, 1974. 2 fig, 2 tab, 17 ref. NSF (GB36787).

Descriptors: *Molybdenum, *Bacteriology, *Metabolism, Metals, *Nitrogen compounds, Laboratory tests, Testing procedures.

Klebsiella pneumoniae M5al grows well in the presence or absence of molybdenum in media containing excess NH4(+). However, growth on N2 is completely dependent on the presence of molybdenum in the medium. Tungstate competes with the molybdate requirement during growth on N2. In molybdenum-depleted medium, neither protein component of nitrogenase is active and neither component can be detected antigenically. These data provide evidence that molybdenum is an inducer of nitrogenase synthesis. (Jernigan-Vanderbilt)

STANDARDS FOR THE PREVENTION OF OCCUPATIONAL LEAD POISONING,
Cincinnati Univ., Ohio. Kettering Lab.
R. A. Kehoe.
Archives of Environmental Health, Vol 23, No 4, p 245-248, October, 1971. 4 ref.

Descriptors: *Lead, *Heavy metals, *Toxicity, *Public health, *Conferences, Pollutants, Human pathology, Inorganic compounds, Water quality standards, Air pollution, *Standards.

A summary is presented of the Conference on Inorganic Lead, Amsterdam, November 28-29, 1968. Certain matters of significance aroused discussion and are worthy of consideration for further investigation. In an industrial plant in which great care is taken to maintain the concentration of airborne particulate lead at a uniform level (approximately 150 micrograms/cu m) in the workrooms, the respiratory exposure of individuals in a group engaged in the same operation in the same area varies considerably. Morphological changes, including nitochondrial swelling and the formation of vacuoles in erythrocytes were described as a feature of the pathological abnormalities of lead poisoning in animals. Concentration of lead in the blood was generally regarded as the most important measure for the control of hazard and for the detection of lead poisoning in the inorganic lead industries. Complex social and personal factors create difficulties in arriving at decisions as to whether workmen should be permitted to continue at work under conditions of exposure to lead, when the analytical results are found to be up to, or above, maximum safe levels. WHOLE-BODY AND HAIR RETENTION OF CADMIUM IN MICE, INCLUDING AN AUTORADIOGRAPHIC STUDY ON ORGAN DISTRIBUTION,
Karolinska Institute, Stockholm (Sweden). Dept. of Hygiene.
G. F. Norberg, and K. Nishiyama.
Archives of Environmental Health, Vol 24, No 3, p 209-214, March, 1972. 2 tab, 3 fig, 24 ref.

Descriptors: *Cadmium, *Animal physiology, *Rodents, Distribution, Toxicity, Laboratory tests, Laboratory animals, Analytical techniques, *Pollutant identification, *Bioassay.

This study was designed to show how cadmium is eliminated from the bodies of mice and to see if cadmium concentration in hair correlated with whole-body or organ concentration of the metal. The relationship between concentrations of cadmium in hair and the whole body is of interest when discussing which biological sampling materials could be reliable indicators of cadmium accumulation in the body. When whole-body and hair concentrations of cadmium were followed at regular intervals up to 112 days after an intravenous injection of cadmium chloride tagged with cadmium 109 in mice, a correlation coefficient of .99 was found. Retention of cadmium in different tissues was illustrated by organ assay and whole-body autoradiography and was especially pronounced in the kidneys and pancreas. (Jernigan-Vanderbilt)

ELECTRON MICROSCOPIC STUDY OF CADMIUM NEPHROTOXICITY IN THE RAT,
Kyushu Univ., Fukuoka (Japan). Dept. of Public Health.
M. Nishizumi.
Archives of Environmental Health, Vol 24, No 3, p 215-225, March, 1972. 1 tab, 13 fig, 40 ref.

Descriptors: *Cadmium, *Electron microscopy, *Toxicity, *Rodents, Analytical techniques, Public health, Laboratory tests, Laboratory animals, Human pathology, Pollutant identification.
Identifiers: *Nephrotoxicity.

In rats given drinking water containing cadmium chloride, renal changes evidenced by electron microscopy were confined to the cells of proximal tubules, consisting of two distinct histologic features, increase of lysosomes and swelling of mitochondria. The size and number of lysosomes increased in proportion to the amount of ingestion of cadmium. The usual elongated, rod-shaped mitochondria of the proximal tubular cells became oval or rounded and increased in volume. The cristae were vesicular, shortened, and marginal. There were some other changes, such as increase of microbodies, focal proliferation of the smooth endoplasmic reticulum, and appearance of intranuclear inclusions. These alterations in the proximal tubular cells of cadmium-intoxicated rats indicate an activation of the detoxifying process and impairment of energy metabolism. (Jernigan-Vanderbilt)

BIOLOGIC EFFECT OF METALLIC CONTAMINANTS-THE NEXT STEP,
National Inst. of Environmental Health Sciences, Research Triangle Park, N.C.
D. H. K. Lee.
Environmental Research, Vol 6, p 121-131, 1973. 7 fig, 6 ref.

Descriptors: *Heavy metals, *Trace elements, *Industrial wastes, Public health, Human pathology, Contaminants.

Research on biomedical effects of metallic contaminants has produced far more diversity of information than development of concept. The scope of inquiry has characteristically been element by element without much regard to similarities and contrasts between them. While there has been some systematic review of the various metals, a truly comparative toxicology, or pharmacology, examining the basic molecular behavior in living material, is still wanting. Two areas of deficiency are considered in detail: (1) the relative contributions from different sources to the total impact on man; and (2) relative involvement of physiological mechanisms in response to different metals. An analysis is made of known information about Hg, Pb, and Cd to show similarities, differences, and areas of poor comparative information. To put studies of individual metals in better perspective there is needed: (1) knowledge of the environmental distribution of the metallic compounds, their impact upon the various portals of entry to man, and assessments of total body exposure and (2) detailed comparison of the metabolic fate and pharmacologic responses of various metals and their compounds to provide a more systematic basis for the handling of future toxicologic problems. BIOCHEMICAL RESPONSES TO PROVOCATIVE CHELATION BY EDETATE DISODIUM CALCIUM,
Institute of Industrial Hygiene and Occupational Diseases, Prague (Czechoslavakia).
J. Teisinger.
Archives of Environmental Health, Vol 23, No 4, p 280-283, October, 1971. 5 tab, 11 ref.

Descriptors: *Lead, *Absorption, *Human pathology, *Injection, *Chelation, Exposure, Urine, Industrial wastes, Statistical methods.

The body burden of lead in the intact (living) human adult can be estimated, relatively, for the purposes of preventive medicine, by intravenously injecting 10 ml of a 20% solution of edetate disodium calcium (CaNa2EDTA), after which the total output of the urine during the next 24 hours is collected and analyzed for its lead content. The responses of persons who had been subjected to severe occupational exposure to lead up to the time of the injection were judged to be critical, in terms of undue occupational risk, when the urinary output of lead during the next 24 hours amounted to as much as 2 mg. THE EFFECT OF HEATED WATER ON THE TEMPERATURE AND EVAPORATION OF HYCO LAKE, NORTH CAROLINA, 1966-72,
Geological Survey, Raleigh, N.C.
W. L. Yonts, and G. L. Giese.
Available from NTIS, Springfield, Va 22161, as PB-234 083, Price $3.25 printed copy; $2.25 microfiche. Water-Resources Investigations 11-74, May 1974. 38 p, 14 fig, 6 tab, 5 ref.

Descriptors: *Thermal pollution, *Lakes, *North Carolina, *Evaporation, *Water temperature, Heated water.
Identifiers: *Hyco Lake(NC).

Loading of Hyco Lake, North Carolina, by heat from two steam-electric generators resulted in higher temperatures and increased evaporation. During the winter, local temperature increases of 34 deg F were sometimes observed at the surface as heated water spread out on top of the cooler, more-dense, lake water, affecting areas as large as 2,590 acres with temperature increases averaging up to 12 deg F higher than natural lake temperatures. In the summer average temperature increases at the surface seldom exceeded 6 deg F and the maximum area affected was 2,570 acres. Forced evaporation from the heated part of the Hyco Lake increased in proportion to the added heat, reaching a maximum of 23.1 inches in 1970, as compared to 55.6 inches of natural evaporation for that year. In 1969, over the heated area, 210,600 British thermal units per square foot per year of heat were added to the lake. Of this

amount, about 58% of the heat was utilized for evaporation, 24% for back radiation, 8.0% was conducted as sensible heat from the lake, 1.0% was removed through outflow, and 0.04% was advected by the evaporated water. (Knapp-USGS)

PAUNCH MANURE AS A FEED SUPPLEMENT IN CHANNEL CATFISH FARMING,
Oklahoma Cooperative Fishery Unit, Stillwater.
R. C. Summerfelt, and S. C. Yin.
Copy available from GPO Sup Doc as EP1.23: 660/2-74-046, $1.60; microfiche from NTIS, Springfield, Va 22161 as PB-235 575, $2.25. Environmental Protection Agency, Technology Series Report EPA-660/2-74-046, May 1974. 114 p, 12 fig, 30 tab, 50 ref, append. EPA Project R800746 (formerly 12060 HVQ).

Descriptors: *Aquaculture, Water pollution effects, Abatement, Beef cattle, Water quality, *Channel catfish, *Farm wastes, *Fish farming, Fish diets, Recycling.
Identifiers: Channel catfish farming, Fish nutrition, *Paunch manure, Abbattoir wastes, Recycling animal wastes, Slaughterhouse wastes, Food processing wastes.

Part A of this report examines the feasibility of using dried paunch at 10, 20 and 30% levels in feed for pond-rearing yearling channel catfish to market-size, and at a 10% level for cage-culture of yearling catfish. Part B describes the effects of fish culture, using standard feeds and paunch-containing feeds, on water quality of fish ponds. In all, one physical, one bacteriological, and fifteen chemical parameters were measured. Regardless of feed type, pond-reared fish grew faster than the cage-reared fish. There was no significant difference in final weights attained by fish given standard, and 10 and 20% paunch feeds but fish given 30% paunch were significantly smaller. Feed costs per kg of catfish produced using the standard commercial sinking feed and sinking feed containing 10% paunch were essentially equal, but feed costs for making sinking feed with 10 and 20% paunch were greater than the standard. The costs of making a floating feed containing 10% paunch for raceway or cage culture of channel catfish were uneconomical. Neither the pond culture nor the cage culture caused deterioration in water quality in any of the ponds to any appreciable degree in one growing season of 24 weeks, and there was no significant difference in water quality in general between the ponds in which commercial feeds were used and those in which paunch-containing feeds were used--this was true in both pond and cage cultures. (EPA)
W74-11796

SOME NUTRITIONAL CHARACTERISTICS OF SPIRULINA MAXIMA ALGAE GROWN IN EFFLUENTS FROM BIOLOGICAL TREATMENT PLANT,
University of Western Ontario., London. Faculty of Engineering Science.
H. T. Nguyen, N. Kosaric, and M. A. Bergougnou.
Canadian Institute of Food Science Technology, Journal, Vol 7, No 2, p 114-116, April, 1974. 1 fig, 2 tab, 10 ref.

Descriptors: *Cyanophyta, Effluents, *Municipal wastes, Treatment facilities, Biological treatment, Lipids, Carbohydrates, *Proteins, *Amino acids, *Nutrient requirements, Water pollution effects.
Identifiers: *Spirulina maxima.

Spirulina maxima, a high protein blue-green alga, was grown in effluents from a municipal waste treatment plant. The protein content of the algal biomass tended to decrease at the later phase of batch culture while the fat and carbohydrate contents increased. The relative protein amino acid composition did not change and was comparable to that of algae grown in synthetic medium. (Sandoski-FIRL)

UPTAKE OF MERCURIC CHLORIDE AND METHYLMERCURY CHLORIDE FROM LIQUID MEDIA BY ASPERGILLUS NIGER AND PENICILLIUM NOTATUM,
Texas Women's Univ., Denton. Dept. of Chemistry.
J. E. Hardcastle, and N. Mavichakana.
Bulletin of Environmental Contamination and Toxicology, Vol 11, No 5, p 456-460, May, 1974. 2 fig, 1 tab, 9 ref.

Descriptors: *Mercury, *Soil fungi, Investigations, Environmental effects, Absorption.
Identifiers: *Mercury uptake, *Aspergillus niger, *Penicillium notatum.

The uptake of an inorganic and organic form of mercury by two common soil fungi, Aspergillus niger and Penicillium notatum, were measured. Results indicate that both A. niger and P. notatum have a certain tolerance for mercury and are able to grow and reproduce with certain levels of the element in their tissues. Thus it is suggested that because of their abundance and ability to concentrate mercury, the fungi's role in the metabolism of mercury in the environment is important and should receive further study. Identifiers: Halimeda, Penicillus, Valonia, Crab megalops.

Literature and theoretical studies have demonstrated the likely existence of critical thermal transition regions for biological activity. Highly nonlinear thermal effects appear to be manifestations of higher-order phase transitions most likely in the vicinal water of the cellular systems. The effects are likely invariants in time and space. Thus, the corresponding critical temperature regions may represent absolute, upper permissible thermal pollution limits. Laboratory experiments, using some 18,000 individuals have yielded the most accurate thermal tolerances to date for marine estuarine organisms (including macro-algae and larval stages of important food-chain organisms). Gaussian (or skewed-Gaussian) curves for lethal thermal limits were not observed. Instead an abrupt death point occurred, often within an interval of 0.5 to 1C. The temperature tolerances obtained in the laboratory conformed closely to those observed in the field. Thus upper limits found in the laboratory for Halimeda, Penicillus, and Valonia were found to be the thermal limits in the field. At Turkey Point, these plants disappeared above the thermal limits. The upper temperature limit for many of the plants examined, as well as the sensitive stage of the pink shrimp, crab megalops and several carideans, was 31 to 33C. This critical temperature region is within 1 to 3C of mean mid-summer temperatures substantiating the hypothesis that tropical marine organisms live closer to their upper lethal limit than do either temperate or Arctic species. (EPA)

THE RELATION BETWEEN WATER QUALITY AND THE STATUS OF FISH POPULATIONS IN WILLOW BROOK,
Water Pollution Research Lab., Stevenage (England).
J. F. de L. G. Solbe.
Water Treatment and Examination, Vol 22, Part 1, p 41-61, 1973. 9 fig, 2 tab, 21 ref.

Descriptors: *Water pollution effects, *Water quality, *Fish populations, *Lethal limit, Streams, Methodology, Analytical techniques, *Toxicity, Water chemistry, Metals, Pollutants, Spectropotometry, Zinc, Ammonia, Phenols, Cadmium, Detergents, Mercury, Distribution, Salmonids, Fisheries.
Identifiers: *Roach, Willow Brook(England), LC50, Salmo ssp., Rutilus rutilus, Detoxification.

The predicted acute lethal toxicity to rainbow trout of the water in the polluted Willow Brook, Northamptonshire, over a 25-month period has been used to describe the water quality. Toxicity varied greatly from day to day but regular seasonal variations were demonstrated in the lower reaches. It was greatly reduced as the water passed downstream, particularly as it passed through two upper lakes. A general relation was found between temperature and reduction in toxicity in the lower streams. Zinc was the predominant poison, ammonia and phenol being only occasionally important in the upper streams. Fish were found upstream of the polluting discharges and were absent for several kilometers downstream. Deene Lake supported 3 species and the number increased to ten 18 km below. (Katz)

EFFECT OF RATE AND DURATION OF FEEDING DDT ON THE REPRODUCTION OF SALMONID FISHES REARED AND HELD UNDER CONTROLLED CONDITIONS,
New York State Dept. of Environmental Conservation, Albany.
G. E. Burdick, H. J. Dean, E. J. Harris, J. Skea, and R. Karcher.
New York Fish and Game Journal, Vol 19, No 2, p 97-115, July 1972. 17 tab, 6 ref.

Descriptors: *Fish reproduction, *Fishkill, *Toxicity, *Mortality, *Pesticides, *DDT, *Brook trout, *Brown trout, Trout, Salmonids, Immature growth stage, Juvenile fish, Viability, Fish eggs, Fish hatcheries, Reproduction, DDE, Statistical models, Water pollution effects, Chromatography.

Losses of fry during various periods of development are compared for brown trout and brook trout hatched from eggs taken from females fed DDT at different concentrations and for various lengths of time, and for control fish fed no DDT. Significant differences were determined statistically and only one period, from swim-up (i.e. when hatchery feeding is normally begun) for a specified time thereafter, showed significant losses. This was dependent on the time DDT was fed before spawning, and the weekly dosage in milligrams per kilogram of body weight. DDT was confirmed as the cause of approximately 100% mortality of lake trout fry reared from eggs taken after adding 6 mg/kg of DDT to the weekly diet of potential breeders. (Katz)

TRACE METALS IN NEW YORK STATE FISH,
Corning Glass Works, Research and Development Lab., N.Y.
S. C. Tong, W. H. Gutenmann, D. J. Lisk, G. E. Burdick, and E. J. Harris.
New York Fish and Game Journal, Vol 19, No 2, p 123-131, July 1972. 1 fig, 4 tab, 13 ref.

Descriptors: *Heavy metals, *Freshwater fish, *Zinc, *New York, Nickel, Cobalt, Cadmium, Mass spectrometry, Analytical techniques, Bioassay, Carp, Lake trout, Bass, Perches, Absorption, *Trace elements, Pikes, Walleye, Lake Erie, Lake Ontario, Hudson River, St. Lawrence River, Pollutant identification.
Identifiers: Silver, Tin, Vanadium, Barium, Crappie, sturgeon, Muskallange, Striped bass, Lake Champlain, Lake Cayuga.

An analytical survey was conducted of the concentrations of eight metals in fish from 11 New York state waters. Analysis of barium, cadmium, cobalt, nickel, silver, tin, vanadium, and zinc in fish was performed by spark source mass spectrometry following dry ashing of samples. Barium, cadmium and silver were present in the range of 0.1 ppm. Tin and zinc were usually found at relatively higher levels of 0.5 to several ppm. Cobalt, nickel and vanadium were intermediate in concentration being most often less than 1 ppm. (Katz)

Descriptors: *Aeration, *Supersaturation, *Nitrogen, Gases, Pathology, Water quality, Fish hatcheries, Technology, Water quality control, Oxygenation, Dissolved oxygen, Water treatment, Methodology, *Idaho, Treatment facilities, Rainbow trout, Water pollution effects.
Identifiers: *Gas bubble disease, *Degassers, Surface agitators, Orchorhynchus sp.

High nitrogen saturation levels have been proven harmful to fish, and some means to reduce the level to less than 105% is necessary to maintain a healthy hatchery stock. Dworshak National Fish Hatchery, located 1.6 miles below Dworshak Dam on the Clearwater River, Idaho, constructed a water treatment facility to provide a settling basin and aeration facility for low oxygenated reservoir water. Surface mechanical agitators originally installed as aerators successfully reduced nitrogen from 115-130% saturation to levels acceptable for fish culture purposes. The aerators are described. (Katz)

ENVIRONMENTAL EVALUATION BASED ON RELATIVE GROWTH RATES OF FISHES,
Tulane Univ., New Orleans, La. Dept. of Biology.
G. E. Gunning, and A. V. La Nasa.
The Progressive Fish-Culturist, Vol 35, No 2, p 85-86, April, 1973. 1 tab, 3 ref.

Descriptors: *Water quality, *Growth rate, Water pollution control, Analytical techniques, Bioindicators, Water pollution effects, Water pollution sources, Dissolved oxygen, Sewage effluents, *Alabama, Pulp wastes.
Identifiers: *Notropis venustus, Environmental evaluation, Pearl River(Ala), Kraft mill.

A quick and definitive method of environmental evaluation was suggested by comparing the relative growth rates for fishes occupying polluted and unpolluted areas in the same river. Three stations for fish collecting were located above and below polluting sources on the Pearl River. The blacktail shiner (Notropis venustus) was collected and checked for growth rate. The growth rate was greater in fish collected above the points of effluent discharge than in fish collected from polluted waters. This study indicates that one can conduct a short-term study of the growth rate of a single species of fish in order to obtain an overall indication of environmental quality. (Katz)

MASS STRANDING OF MOLLUSCS AT TE WAEWAE BAY, SOUTHLAND, NEW ZEALAND,
Ministry of Agriculture and Fisheries, Wellington (New Zealand). Fisheries Research Div.
D. Eggleston, and R. W. Hickman.
New Zealand Journal of Marine and Freshwater Research, Vol 6, No 3, p 379-382, September, 1972. 2 fig, 1 tab, 7 ref.

Descriptors: *Fishkill, *Molluscs, *Temperature, Weather, Salinity, Mortality.
Identifiers: *Stranding, *Mactra discors, Resania lanceolata, Toheroa, Cold water, *New Zealand.

A stranding of shellfish on the beach at Te Waewae Bay, Southland, occurred during very cold, stormy weather in September 1970. More than 20 million shellfish were stranded, the majority being Mactra discors Gray. It is suggested that the cause was a combination of strong inshore winds and low temperatures, coupled with an increased flow of fresh, cold water across the beach. Water temperatures and salinity dropped, reducing the activity of the animals and their ability to counteract the effects of the heavy sea. (Katz)
W74-11938

SUMMERTIME ARTIFICIAL AERATION INCREASES WINTER OXYGEN LEVELS IN A MICHIGAN LAKE,
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
A. W. Fast.
The Progressive Fish-Culturist, Vol 35, No 2, p 82-84, April, 1973. 1 tab, 11 ref.

Descriptors: *Winterkilling, *Aeration, *Lakes, *Oxygen, Eutrophication, Fishkill, Mortality, Freezing, Limnology, Oxygenation, Dissolved oxygen, Photosynthesis, Iced lakes, Summer, Seasonal, Organic matter, Thermal stratification, Destratification, *Michigan, Reaeration.

Artificial aeration of eutrophic lakes to prevent winterkill is generally conducted immediately prior to or during ice and snow cover. This study involved summertime aeration only and the effects of this on winter oxygen levels were examined. Significant increases in the winter oxygen concentrations were found after 2 months of summertime aeration. The increase was from O mg/l 02 at 7.5 meters to 6.5 mg/l O2 at 7.5 meters. This is attributable to an increase in the oxygen reserve at ice formation and a reduction in the amount of decomposable organic matter as a result of the aeration. Artificial aeration during summer, fall or winter may prevent winterkill. (Katz)
W74-11939

EFFECTS OF WATER REUSE ON RAINBOW TROUT IN HATCHERIES,
Bureau of Sport Fisheries and Wildlife, Bozeman, Mont. Fish Cultural Development Center.
J. D. Larmoyeux, and R. G. Piper.
The Progressive Fish-Culturist, Vol 35, No 1, p 2-8, January, 1973. 8 fig, 3 tab, 13 ref.

Descriptors: *Rainbow trout, *Fish hatcheries, *Water quality, *Water reuse, *Ammonia, *Dissolved oxygen, Trout, Salmonids, Growth rates, Animal physiology, Metabolism, Mortality, Cytological studies, Pathology, Laboratory tests, Microscopy, Aeration, Bioassay, Behavior, Toxicity.
Identifiers: Blood serum, Hematocrits, Histology, Gills, Kidney, Liver.

Fish hatcheries often reuse water through a series of ponds. Fish metabolism reduces oxygen and adds metabolic products to the water. Aeration between ponds can increase oxygen but metabolic products remain. The effects of this reused water on growth, mortality and physiology of rainbow trout were examined in laboratory tests. Results indicated that a decline in fish quality, as evidenced by reduction in growth rate, damage to gill tissue, and occasional pathology in kidney and liver tissue, occurred when oxygen levels fell below 5 ppm and ammonia levels exceeded 0.5 ppm. (Katz)
W74-11940

A DEVICE FOR ALLEVIATING SUPERSATURATION OF GASES IN HATCHERY WATER SUPPLIES,
Bureau of Sport Fisheries and Wildlife, Boston, Mass.
B. A. Dennison, and M. J. Marchyshyn.
The Progressive Fish-Culturist, Vol 35, No 1, p 55-58, January, 1973. 2 fig, 1 ref.

Descriptors: *Supersaturation, *Water quality control, Fish hatcheries, *Aeration, Growth rates, Saturation, Design data, Technology, Water pollution sources, Mortality, Dissolved oxygen, Oxygen, Gases, Water pollution effects.
Identifiers: *Degassers.

Supersaturation of gases in hatchery water can be detrimental to fish survival and growth. A unit is described in detail which has proved highly effective in reducing oxygen and, presumably, nitrogen to saturation levels. Specifications are given for its

construction. This device is equally effective in aerating unsaturated waters. (Katz)
W74-11941

PRELIMINARY STUDIES USING SYNTHETIC POLYMERS TO REDUCE TURBIDITY IN A HATCHERY WATER SUPPLY,
Alchesay National Fish Hatchery, Whiteriver, Ariz.
W. H. Olson, D. L. Chase, and J. N. Hanson.
The Progressive Fish-Culturist, Vol 35, No 2, p 66-73, April, 1973. 8 fig, 3 tab, 8 ref.

Descriptors: Technology, *Turbidity, *Fish hatcheries, *Flocculation, *Water purification, *Water treatment, Desilting, Quality control, Water pollution effects, Methodology, Feeding rates, Rainbow trout, Cytological studies, Microscopy.
Identifiers: Purifloc, Synthetic polymers, Gills, Histology.

Turbidity in hatchery water is closely integrated to fish feeding activities and the subsequent conversion ratio of pounds of feed fed per pound of weight gain. A model water clarification system was tested using synthetic polymers to flocculate and remove suspended materials from the water. Different flocculants were used and a dual treatment with Purifloc A-23 and Purifloc A-31 was found to be the most effective. Biological effects of polymer-treated water as compared to untreated turbid water were examined and no adverse effects were noted in fish reared in treated water. Fish in untreated water of high turbidity lost weight and became inactive. (Katz)
W74-11942

EFFECTS OF HATCHERY WATER REUSE ON RAINBOW TROUT METABOLISM,
Bureau of Sport Fisheries and Wildlife, Columbia, Mo. Fish-Pesticide Research Lab.
F. L. Mayer, Jr., and R. H. Kramer.
The Progressive Fish-Culturist, Vol 35, No 1, p 9-10, January, 1973. 1 tab, 4 ref.

Descriptors: *Fish hatcheries, *Metabolism, *Rainbow trout, *Water reuse, Fisheries, Water quality, Quality control, Trout, Sport fish, Water pollution effects.
Identifiers: Scope for activity, Active metabolism.

Scope for activity, as an index of the fitness of hatchery trout, and the effects of hatchery water reuse were tested on rainbow trout. Scope for activity is the amount of oxygen available for activity and is expressed as the arithmetic difference between active and standard rates of oxygen consumption. It is hypothesized that fish with a higher scope for activity will have a better chance for survival when released into a stream environment. Active metabolism rates were reduced at the rate of 39 mg O2/kg per hour each time the water was reused. Decrease in scope of activity was related directly to this. If survival rate of fish stocked in stream environments is directly related to scope for activity, it is advisable to stock streams with fish cultured in a minimum of reused water. (Katz)
W74-11943

EFFECTS OF HYDROELECTRIC DEVELOPMENT IN WESTERN CANADA ON AQUATIC ECOSYSTEMS,
Simon Fraser Univ., Burnaby (British Columbia). Dept. of Biological Sciences.
G. H. Geen.
Journal of the Fisheries Research Board of Canada, Vol 31, No 5, p 913-927, May, 1974. 4 fig, 48 ref.

Descriptors: *Hydroelectric power, *Salmon, *Canada, *Water pollution effects, *Ecosystems, Electric power industry, Lakes, Environmental effects, Water chemistry, *Thermal pollution, Turbidity, Reservoirs, Supersaturation, Salmonids, Sport fish, Benthic fauna, Chinook salmon, Pink salmon, Sockeye salmon, Food chains, Anadramous fish, Rainbow trout, Sediments, Temperature.
Identifiers: British Columbia, *Onchorynchus ssp.

The effects of some existing and proposed hydroelectric developments on lakes and rivers in Western Canada are considered. There are few pre- and postimpoundment studies from this region on which to base generalizations, although the changes in species composition and water chemistry following impoundment of rivers and lakes reported thus far are comparable to those observed in other areas at similar latitudes. Few data are available which permit prediction of thermal regimes in newly formed reservoirs, particularly in view of the turbid nature of some inflows to reservoirs. Several hydroelectric developments have blocked or impeded migrations of economically important fish and appear likely to produce a number of downstream changes in water temperature or composition, the effects of which are often speculative. More studies of the effects of altered temperature and flow regimes, reduced turbidity and gas supersaturation are required. (Katz)
W74-11944

HIGH ZINC CONCENTRATION IN COMMON CARP VISCERA,
Academia Sinica, Taipei (Taiwan). Inst. of Zoology.
S. S. Jeng, and H. W. Lo.
Bulletin of the Japanese Society of Scientific Fisheries (Nippon Suisan Gakkaishi), Vol 40, No 5, p 509, May, 1974. 2 tab, 2 ref.

Descriptors: *Carp, *Zinc, *Absorption, Bioassay, Water pollution effects, Water pollution sources.
Identifiers: *Cyprinus carpio, Kidney, Digestive tract, *Taiwan.

The concentration of zinc in the common carp is much higher, by a factor of ten, than in all other fish cultured in Taiwan. The concentration of zinc in the digestive tract and kidney was 15 times higher than in any other fish, at about 300 ppm. The reasons for this are unknown. (Katz)
W74-11946

FACTORS INFLUENCING FORMALIN TOXICITY IN TROUT,
Bureau of Sport Fisheries and Wildlife, Bozeman, Mont. Fish Cultural Development Center.
R. G. Piper, and C. E. Smith.
The Progressive Fish-Culturist, Vol 35, No 2, p 78-81, April, 1973. 3 tab, 12 ref.

Descriptors: *Toxicity, *Pesticides, *Rainbow trout, *Fish hatcheries, Fishkill, Mortality, Water quality, Temperature, Biocontrol, Parasitism, Pest control, Metabolism, Water chemistry, Brook trout, Channel catfish, Water pollution effects.
Identifiers: *Formalin.

Formalin is an effective treatment in the control of various external fish parasites, but sometimes causes high fish losses. Data on the effects of water quality and other factors on the toxicity of formalin from 72 fish hatcheries are examined. Rainbow trout were found to be the predominant problem species and water chemistry was found to have no correlation with incidence of formalin toxicity. Error in treatment was found to cause excessive mortality; water temperature was a notable factor in mortality; and two workers indicated that pretreatment starvation alleviated mortalities. (Katz)
W74-11947

OIL POLLUTION MONITORING IN THE LAGOON OF VENICE USING THE MUSSEL MYTILUS GALLOPROVINCIALIS,
Instituto di Biologia del Mare, Venice (Italy).
V. U. Fossato, and E. Siviero.
Marine Biology, Vol 25, No 1, p 1-6, July, 1974. 1 tab, 2 fig, 13 ref.

Descriptors: *Mussels, *Bioindicators, *Oil pollution, Water pollution sources, Bioassay, Absorption, Monitoring, Oil wastes, Industrial wastes, Fuels, Mollusks, Benthos, Analytical techniques, Gas chromatography, Pollutant identification.
Identifiers: *Mytilus galloprovincialis, Aliphatic hydrocarbons.

Gas chromatographic analyses of mussels from different areas of the Lagoon of Venice show that these organisms contain a very complex mixture of hydrocarbons attributable to fuel oil contamination. The measured amounts normally range from 0.8 to 8.7 mg/100g wet weight, but values as high as 22.0 mg/100g were recorded. This high value indicates a saturation limit for these organisms which is considerably higher than those values normally found in mussels from the lagoon. The aliphatic hydrocarbon levels in mussels are related to distance from pollution sources and to the degree of the exchange between the sea and the area sampled. On the basis of this relationship between overall hydrocarbon pollution load and level of pollution of the mussel, it appears that this bivalve might be effectively utilized as a self-integrating monitoring index of oil pollution in the waters of the lagoon. (Katz)
W74-11948

SOME OBSERVATIONS ON THE INTERACTIONS OF MARINE PROTOZOA AND CRUDE OIL RESIDUES,
University Coll. of North Wales, Menal Bridge. Marine Science Lab.
A. R. Andrews, and G. D. Floodgate.
Marine Biology, Vol 25, No 1, p 7-12, July, 1974. 4 fig, 1 tab, 9 ref.

Descriptors: *Oil, *Protozoa, *Digestion, Microorganisms, Laboratory tests, Microscopy, Microbiology, Sea water, Methodology, Nematodes, *Absorption, Water pollution effects.
Identifiers: *Crude oil residues, Bodo.

Marine protozoa were observed to take up Kuwait crude oil residues in the laboratory and the field. The oil was only found to be ingested in the presence of a suitable food substance, including bacteria adhering to partially degraded oil globules. Little is known about the digestion of mineral oils by protozoa. (Katz)
W74-11949

SALINITY AND TEMPERATURE TOLERANCE OF ZOEAE OF THE PORTUNID CRAB SCYLLA SERRATA,
Rhodes Univ., Grahamstown (South Africa). Dept. of Zoology.
B. J. Hill.
Marine Biology, Vol 25, No 1, p 21-24, July, 1974. 1 fig, 7 ref.

Descriptors: *Crabs, *Immature growth stage, Temperature, *Salinity, Larvae, Larval growth stage, Resistance, Mortality, Thermal stress, Sea water, Water pollution effects, *Africa.
Identifiers: *Scylla serrata, *Zoeae, Lower limit, *Temperature tolerance.

The tolerances of the first zoeal stage of the crab Scylla serrata have been investigated in 61 different temperature-salinity combinations. Exposure to temperatures above 25C or to salinities below 17.5 parts per thousand caused considerable mortality; therefore, zoeae are unsuited to estuarine conditions. The larvae can tolerate temperatures down to 5C, but they are inactive below 10C. It is suggested that 10C is probably a lower limit and that female crabs which migrate to sea to release their eggs do not enter water with a temperature below 12C. Hydrological conditions along the south-east coast of Africa indicate that females would, therefore, migrate less than 10 km offshore. (Katz)

W74-11950

ALKANES AND ALKENES IN MARINE BENTHIC ALGAE,
Florida Technological Univ., Orlando. Dept. of Chemistry.
W. W. Youngblood, and M. Blumer.
Marine Biology, Vol 21, No 3, p 163-172, 1973. 2 fig, 9 tab, 25 ref.

Descriptors: *Organic compounds, *Benthic flora, Biochemistry, Benthos, *Marine algae, Marine plants, Bioassay, Oil, Analytical techniques, Gas chromatography, Mass spectrometry, Metabolism, Oil pollution, Chemistry, Phaeophyta, Chlorophyta, *Massachusetts, Water pollution effects, Pollutant identification.
Identifiers: Olefins, Polyolefines, Fuccus ssp, Ascophyllum ssp, *Alkanes, *Alkenes, HEH isomers, Fatty acids, *Cape Cod(MA).

Saturated and olefinic hydrocarbons were determined in several species of benthic marine algae from the Cape Cod area. The distribution of homologous and isomeric olefins was studied in plants of different age and in morphologically different parts of the same specimen. Methylene-interrupted C19- and C21- polyolefins are particularly abundant; delta (1)-heneicosahexaene and the corresponding pentaene are common to all brown algae, while the corresponding delta (3) -isomers occur in green algae. Hydrocarbon concentration, the alkene-to-alkane ratio and the polyolefin content are highest in young plants or in rapidly growing tissues of older plants. This suggests a deeper involvement in cell biochemistry of straight-chain hydrocarbons than previously considered. The biosynthesis of the plant polyolefins remains to be explored. The hydrocarbon composition of these benthic algae differs greatly from that of fossil fuels in its simplicity and predominately unsaturated nature. The separation of the isomers by gas chromatography and mass spectrometry are discussed. (Katz)

RESPONSE OF ASTERIAS VULGARIS TO CHEMICAL STIMULI,
Woods Hole Oceanographic Institution, Mass.
O. Zafiriou.
Marine Biology, Vol 17, No 2, p 100-107, 1972. 3 tab, 16 ref.

Descriptors: *Crustaceans, *Attractants, *Repellents, Behavior, Ureas, Methodology, Bioassay, Laboratory tests, Water pollution effects, Hydrogen ion concentration.
Identifiers: *Asterias vulgaris, *Sea stars, *Chemical stimuli, Lactic acid, Handsweat.

Groups of the sea star, Asterias Vulgaris, approached a variety of chemical stimuli in a flow tank. Urea, lactic acid, succinic acid, and 'handsweat' were attractive to some animals; some simple acids and amino acid mixtures were weakly attractive; pH changes and seawater salts were not attractive. Although the groups were similarly maintained and responded with high internal consistency, they differed in responsiveness to different substances. These variations are not easily accounted for as contamination or effects of prior animal experience. Asterias Vulgaris detects many simple organic substances, but the behavioral response is not constant and species-wide; it depends on non-chemical factors. This sensory/behavioral mode presumably suits a non-specialist predator, and may be widespread among similar asteroids. Individuals attracted to lactic acid could be induced to cling to and evert their stomachs over a sponge soaked in lactic-acid solutions. The chemicals found attractive in this study do not account for most of the attractiveness of shellfish tissue extracts studied previously. (Katz)

THE PRESENT AND FUTURE SITUATION OF NUCLEAR ENERGY PRODUCTION AND ITS ASSOCIATED INDUSTRY--NORMAL OPERATION, ACCIDENT PREVENTION AND MITIGATION, COMPARATIVE RISK ASSESSMENT,
Directorate-General for Industrial, Technological and Scientific Affairs. Commission of the European Communities, Brussels (Belgium).
W. Vinck, H. Boos, F. Luykx, H. Maurer, and J. V. Caeneghem.
Available from European Community Information Service, 2100 M St., N.W., Suite 707, Washington, D.C. Report EUR-5001 d, e, f, n., 1973. 60 p, 11 tab, 98 ref.

Descriptors: *Assessment, *Forecasting, *Nuclear energy, *Nuclear powerplants, *Nuclear reactors, *Nuclear wastes, Sites, Safety, Environment, Radioactivity, Hazards, Effluents, Water pollution, Public health, Food chains, Environmental effects.
Identifiers: *Fuel reprocessing.

An outline is presented of the present status and of the future trends in nuclear energy development in the six Member States of the European Community and in the frame of its future enlargement. Emphasis is placed upon the technical safety aspects, the siting and environmental considerations and the implications for mankind as compared to conventional hazardous industries. The radioactive effluents routinely released at present by nuclear power and reprocessing plants are investigated and the future increase estimated on the basis of: (1) The second Community Target Nuclear Programme; (2) typical BWR and PWR releases, and (3) the nuclear capacity installed assuming that half of it is of the PWR type and the other half of the BWR type. It was found that only the noble gas releases in the gaseous effluent streams give rise to special supplementary precautions, justified not really by global effects through gradual buildup in the biosphere and the atmosphere, but rather by local or regional effects in the vicinity of the plants. Finally, it is concluded that at present the record of the nuclear power industry is, compared to conventional hazardous industries, extremely favourable from the point of view of human injury from gaseous and effluent releases for the professionally exposed as well as for the general public. (Houser-ORNL)

ASSESSING POTENTIAL RADIOLOGICAL IMPACTS TO AQUATIC BIOTA IN RESPONSE TO THE NATIONAL ENVIRONMENTAL POLICY ACT (NEPA) OF 1969,
Oak Ridge National Lab., Tenn.
S. V. Kaye.
Available from NTIS, Springfield, Va., 22161 as CONF. 730503-2; $4/copy, $2.25 microfiche. In: Environmental Behaviour of Radionuclides Released in the Nuclear Industry: CONF 730503, Proceedings of Conference AIX-EN Provence, France, May 14, 1973. International Atomic Energy Agency, Vienna, p 149-661, 1973.

Descriptors: *Nuclear powerplants, *Radioactivity, *Effluents, *Streams, *Surface waters, *Water pollution, Environment, Environmental effects, Aquatic life, Aquatic animals, Aquatic plants, Fish, Biota, Cesium, Cobalt, Strontium, Manganese.

Assessment of impacts for nuclear power stations sited near bodies of water receiving reactor effluents indicates that aquatic biota may receive higher doses than do terrestrial biota and that potential doses due to internal deposition of radionuclides may be several hundred times greater than potential external doses from immersion in contaminated water. Estimated doses are listed in each environmental impact statement for aquatic plants, invertebrates (crustaceans and molluscs), and fish. Where appropriate, doses are also estimated for waterfowl, shore birds, or muskrats. A steady-state bio-accumulation factor (concentration of radionuclide in biota-concentration of radionuclide in water) is used to estimate the body burden of each radionuclide for calculating internal dose. In most cases, site specific bioaccumulation factors are not available, and literature values, which usually cover a wide range, must be considered for the calculations. The radionuclides released from water-cooled reactors to the aquatic system differ from plant to plant, depending upon the type of radioactive waste cleanup system, but the most important dose-contributing radionuclides are usually Cs-134 and Cs-137. Radionuclides of lesser importance are Co-58, Co-60, Sr-90, Sr-91, and Mn-54. (Houser-ORNL)

ASSESSMENT OF THE ECOLOGICAL CONSEQUENCES OF HERBICIDE USE ALONG TRANSMISSION LINE RIGHTS-OF-WAY AND RECOMMENDATION FOR SUCH USE,
Argonne National Lab., Ill.
J. D. Buffington.
Available from NTIS, Springfield, Va 22161 as ANL/ES-34, Price $4.00 printed copy; $2.25 microfiche. Environmental and Earth Sciences Report ANL/ES-34, April 1974. 44 p, 6 fig, 3 tab, 90 ref. AEC Contract W-31-109-Eng-38.

Descriptors: *Herbicides, *Brush control, *Ecology, *Environmental effects, Water pollution sources, Powerline carriers, Transmission lines.

The ecological effects of use of herbicides to maintain transmission line rights-of-way are reviewed. Vegetation management programs presented to the U.S. Atomic Energy Commission as part of a license application involve the use of 2,4-D, 2,4,5-T, silvex, picloram, and dicamba. Review of the literature dealing with these herbicides leads to the conclusion that they should be regarded as hazardous substances which may be used to society's benefit for vegetation management along transmission lines only so long as reasonable precautions are followed. A series of recommendations is included which, if followed, should prevent unacceptable environmental damage and hazard to human health. (Knapp-USGS)

METROPOLITAN WATER INTELLIGENCE SYSTEMS--COMPLETION REPORT, PHASE III,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
N. S. Grigg, J. W. Labadie, and H. G. Wenzel.

Available from the National Technical Information Service, Springfield, Va. 22161 as PB-235 532; $6.75 in paper copy, $2.25 in microfiche. Completion Report, June 1974. 258 p, 50 fig, 19 tab, 151 ref, append. OWRTC-4172(9028)(4).

Descriptors: *Control systems, *Sewers, *Storm runoff, *Overflow, *Optimization, *Information systems, Water pollution control, Storage, Detention, Reservoir operation, Mathematical models, Dynamic programming, Automatic control, Systems analysis, Cities, Institutional constraints. Identifiers: *Combined sewer systems, *Mathematical programming, Optimal control theory, Control logic, Urban water systems.

The results of the three phases of the Colorado State University project 'Metropolitan Water Intelligence Systems' (MWIS) are reported. The special type of MWIS considered is the fully automated control system for combined sewer systems. The report principally contains technical data on the solution of the control strategy problem and on optimization techniques for developing control logic. The socio-political problems associated with implementing a MWIS are discussed as well as the problems facing local decision makers who must comply with shifting standards under heavy time, technological, financial and political constraints.

LAND DISPOSAL OF WASTE WATER: PROCESSES, DESIGN CRITERIA, AND PLANNING CONSIDERATIONS,
Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
J. P. Hartigan, Jr.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 311, $5.50 in paper copy, $2.25 in microfiche. Georgia Environmental Resources Center, Atlanta, Report No ERC-1074, August 1974. 166 p, 22 fig, 8 tab, 68 ref. EPA Training Grant 900111.

Descriptors: *Waste water treatment, Overland flow, Planning, Economic efficiency, Terrain analysis, *Terrestrial habitats, Infiltration, *Waste water disposal, Filtration, Volatilization, Ion exchanges, *Water reuse.
Identifiers: *Land disposal, Spray irrigation, Rapid infiltration, Fixation, Economic goals, Social goals, Environmental goals.

The national goal of higher water quality has rejuvenated interest in developing land surfaces for use in waste water treatment. Wastes may be applied by spray irrigation, overland flow, or rapid infiltration. The land surface renovates the water through the processes of filtration, volatization, plant-uptake, ion exchange, and fixation. The application techniques vary in site requirements; sites vary in climate and topography; soils vary in process efficiency; wastes vary in the processes effective in their removal; people vary in expertise, and many disciplines can contribute to comprehensive system design. Out of all these relationships, the important parameters in the design of a land disposal system are the characteristics of the waste water, the water quality goals, possible waste water loading rates, wetting and drying schedules to maintain infiltration rates, size of the available treatment area, type of vegetative cover, and the capacity to store wastes during periods when disposal on the land surface is not advisable. This report synthesizes the above considerations into a standard planning process that can be used to select appropriate combinations of land and advanced waste treatment processes. The steps include identifying the problem in terms of expected waste loads, evaluating the terrestial ecosystem of alternative sites in terms of how the sites will respond to identified waste water characteristics, establishing economic and other environmental and social goals, formulating suitable application techniques for each site, developing alternative plans for treating the total waste load, and final screening and selection. Seventeen numerical examples are used in illustrating specific steps. (James-Geo Tech)

APPLICATION OF STATISTICAL TECHNIQUES TO THE SELECTION OF AN OPTIMAL POLLUTION TREATMENT PROGRAM,
Krannert Graduate School of Industrial Administration, Lafayette, Ind.
A. B. Whinston, J. R. Marsden, and D. E. Pingry.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 327, $4.75 in paper copy, $2.25 in microfiche. Indiana Water Resources Research Center, Lafayette, Technical Report No 51, June 1974. 120 p, 4 fig, 10 tab, 60 ref. OWRT-A-024-IND(8).

Descriptors: *Waste water treatment, *Regional development, *Regional analysis, *Statistical methods, Regression analysis, Data storage and retrieval, Computers, Econometrics, Statistical models, *Optimal development plans, Model studies.
Identifiers: Economic models, Production functions, Data management, Outliers.

This research is directed towards the application of statistical and related techniques to the selection of an optimal pollution treatment system. The work attempts to develop several techniques which can be used in analyzing data obtained from waste treatment plant operations. Using the concepts of cost and production functions, the possibility was explored for developing useful models for the operation of waste treatment plants. The Federal Water Control Act and the 1972 Amendments have given the states the problem of developing and monitoring regional plans for improving water quality. State pollution agencies are turning to the use of computers and modelling techniques for analyzing these problems. It is hoped that the work reported will eventually lead to techniques that help in this task.

LAND APPLICATION OF SEWAGE EFFLUENTS AND SLUDGES: SELECTED ABSTRACTS,
Robert S. Kerr Environmental Research Laboratory, Ada, Okla.
Copy available from GPO Sup Doc as EP1.23:660/2-74-042, $2.80; microfiche from NTIS as PB-235 386, $2.25. Environmental Protection Agency, Technology Series Report EPA-660/2-74-042, June 1974. 248 p.

Descriptors: *Municipal wastes, *Waste water treatment, *Sludge disposal, Irrigation systems, Land reclamation, Groundwater recharge, Public health, Crop response, Cost comparisons, Soil properties, *Abstracts, *Water reuse, Sprinkler irrigation, Economic feasibility, Waste water disposal.
Identifiers: *Infiltration systems, *Overland flow systems, Pretreatment(Waste water).

Current concern about environmental conditions has focused renewed attention on land application as a waste management technique. This report combines selected abstracts from previous publications and updates the sources abstracted into the year 1973. The 568 abstracts selected for inclusion are arrayed in chronological groupings and are identified as to emphasis on effluent or sludge. An author index and a subject matter (descriptor term) index facilitate reference to specific abstracts or to abstracts addressing narrower subject matter areas. Countries, states, and, in some cases, actual project locations are included in the subject matter index as geographic locators. (Thomas-EPA)

CONTROL AND TREATMENT OF RADIOACTIVE LIQUID WASTE EFFLUENTS AT THE SAVANNAH RIVER PLANT,
Du Pont de Nemours (E. I.) and Co., Aiken, S.C. Savannah River Lab.
W. R. Jacobsen, W. L. Marter, D. A. Orth, and C. P. Ross.
Available from National Technical Information Service, Springfield, Va., 22161 as Report No DP-1349, $5.45 paper copy, $2.25 in microfiche. Report No DP-1349, February 1974. 125 p, 7 fig, 11 tab.

Descriptors: *Radioactive waste disposal, *Waste treatment, *Waste storage, *Effluents, *Monitoring, Environment, Environmental effects, Streams, Surface waters, Regulation, Seepage, Documentation, Data collections, *South Carolina.
Identifiers: *Savannah River(SC).

Radioactive waste effluents at the Savannah River Plant are treated on the basis of potential off-site effects. Those wastes that are not stored in tanks or released directly to plant streams are either discharged to seepage basins or treated further to reduce their activity before being discharged. Administrative controls require that releases not result in harmful consequences and that they are also kept as low as practical. The controls, the releases of radionuclides to seepage basins, and other methods used to treat radio active liquid wastes are described. Inventories of radioactivity in soil from discontinued practices are reported. (Houser-ORNL)

TRITIUM CONTROL TECHNOLOGY,
Mound Lab., Miamisburg, Ohio.
T. B. Rhinehammer, and P. H. Lamberger.
Available from NTIS, Springfield, Va 22161 as WASH-1269; $13.60 paper copy, $2.25 in microfiche. Report No WASH-1269, December 1973. 541 p, 102 fig, 24 tab, 374 ref, 1 bibliography.

Descriptors: *Tritium, *Monitoring, *Radioactivity, Effluents, *Safety, Evaluation, *Radioactive waste disposal, Waste storage, *Waste treatment, Nuclear powerplants, Nuclear reactors, Fuels, Research and development, Laboratories, Operations, Design criteria, Technology.

Current tritium control practices in the United States are summarized. The practices, methods

and operating experiences of AEC contractors and private industry in the areas of tritium monitoring, handling, containment, trapping, removal, packaging, storage, and disposal are reported. Tritium control practices of Government-owned laboratory and process facilities, light- and heavy-water reactors, fuel reprocessing plants and waste disposal facilities are described. Emphasis has been placed on current practice, design, technology and operating tritium control systems. (Houser-ORNL)

MERCURY RECOVERY FROM PROCESS SLUDGES,
Georgia-Pacific Corp., Bellingham, Wash.
R. A. Perry.
Chemical Engineering Progress, Vol 70, No 3, p 73-80, March, 1974. 6 fig, 11 tab, 10 ref. EPA Project 12040 DU. Program Element No 1B2037.

Descriptors: *Industrial wastes, *Mercury, *Waste water treatment, *Sludge treatment, Inorganic compounds, Solid wastes.
Identifiers: *Mercury recovery.

Mercury-cell chlor-alkali facilities in North America have reduced total mercury discharges into receiving waterways to less than 0.5 lb/day, and some to less than 0.1 lb/day. However, this has frequently involved the stockpiling of mercury-containing materials such as process sludges, and has led to a need for a new approach to mercury removal. Georgia-Pacific Corporation developed, designed, and completed a plant to demonstrate the successful recovery of mercury from these sludges and sediments. The system was sized on the basis of 3.5 ton/day to handle the expected solids at 200 ton/day chlorine production (2.0-2.5 ton/day dry solids) plus 1.0-1.5 ton/day solids from stockpiled sludge and other mercury-containing solids. The major pieces of equipment include a 6 ft x 12 ft thickener, a rotary vacuum filter and the 54 in. I.D., six-hearth multiple hearth furnace. If shower water is needed to clean the filter cloth or sluice out sludge build-ups, brine will be used and returned to the sludge pit. No fresh water will be used for wash-down to maintain water balance. This process is capable of reducing the mercury content of brine sludge to less than 1 ppm. (Jernigan-Vanderbilt)

CONSTRAINTS TO SPREADING SEWAGE SLUDGE ON CROPLAND,
National Environmental Research Center, Cincinnati, Ohio.
G. K. Dotson.
News of Environmental Research in Cincinnati, May 31, 1973. 4 p, 2 fig, 14 ref.

Descriptors: *Sewage sludge, *Crops, *Metals, Constraints, *Nitrogen, Agriculture, Pathogenic bacteria, Water pollution control, Nitrification, Denitrification, Toxicity, Disinfection, Soil pollution.

Constraints on the use of industrial or domestic sewage sludge for fertilizing cropland or for soil improvement in humid areas include nitrogen excesses, toxic metals, pathogens, public resistance, legal restrictions, unfavorable soils and incomplete sludge stabilization. Amounts of nitrogen supplied are estimated from the sludge application. Pathways of nitrogen conversion and the possible contamination of groundwater are discussed. Factors making toxic metals available to plants and the determination of levels which are toxic are mentioned. Pathogens in sludge can live up to several months after application to the soil. Disinfection techniques include long term storage, pasteurization, addition of lime, chlorine or other chemicals. Research needs, with regard to the nitrogen content and toxic elements, especially long-term effects, are listed. (Rowe-Vanderbilt)

CHARACTERIZATION AND TREATABILITY OF CHROME TANNING WASTE,
Central Public Health Engineering Research Inst., Kanpur (India).
S. N. Chattopadhaya, H. C. Arora, and V. P. Sharma.
Indian Journal of Environmental Health, Vol 15, No 3, p 208-221, July, 1973. 6 fig, 4 tab, 5 ref.

Descriptors: *Chromium, *Industrial wastes, *Waste water treatment, *Tannery wastes, Toxicity, Sampling, Suspended solids, *Flocculation, Chemical precipitation, Coagulation.
Identifiers: *India.

This study was undertaken at a tannery which utilizes chrome tanning of goats' skins, with the objective of removing chromium from waste before subjecting it to the conventional biological treatment methods. The two major sources of chromium-containing wastes were termed waste stream 'A' and waste stream 'B'. The units which contributed to stream 'A' were: (1) soaking of skins with plain water; (2) floor washings from 'Painting with sulfide and lime' unit; (3) liming unit; (4) defleshing and scudding unit; and (5) deliming and bating unit. Stream 'B' was exclusively formed by waste from a pickling and chrome tanning unit and contains a heavy quantity of exhaust chrome (mostly in trivalent form). Since the waste in channel 'A' was highly alkaline and that in channel 'B' was highly acidic, it was concluded that the obvious procedure would be to precipitate the chromium as chromium hydroxide by the simple process of neutralization. This did not work because the settled waste had fine flocs in suspension. A number of procedures on the settled waste were tested; simple flocculation followed by four hours settling showed the highest percent reduction of chromium. A stepwise procedure for treatment is given. (Jernigan-Vanderbilt)

SOLVENT EXTRACTION OF NITRATE FROM TITANIUM LEACHER EFFLUENT,
Bureau of Mines, Salt Lake City, Utah. Salt Lake City Metallurgy Research Center.
J. R. Ross, S. R. Borrowman, and D. R. George.
Available from NTIS, Springfield, Va 22161 as PB-227 175, Price $3.00 printed copy; $2.25 microfiche. Bureau of Mines Report of Investigations 7733, 1973. 12 p, 8 fig, 1 tab.

Descriptors: *Nitrates, *Industrial wastes, *Recycling, *Waste water treatment, Water pollution control, Acids, *Titanium, *Solvent extraction, Leaching.

The extraction and recovery of nitrate from waste solutions generated in the production of titanium were investigated using solvent extraction techniques. Laboratory studies and continuous tests in a small solvent-extraction system showed that up to 98 percent of the nitrate can be selectively extracted by a solution of tributyl phosphate in kerosine. The extracted nitrate can be recovered as nitric acid, at concentrations suitable for reuse, by stripping the loaded organic with water. (Knapp-USGS)

EVALUATION OF A FIELD-TYPE INCINERATION FOR HUMAN WASTE, (THEATER OF OPERATION SEWAGE TREATMENT SYSTEMS),
Army Construction Engineering Research Lab., Champaign, Ill.
J. Matherly.
Available from NTIS, Springfield, Va. 22161 as AD-760 490, Price $3.00 printed copy, $2.25 microfiche. Technical Report E-10, March 1973. 58 p, 3 fig, 2 tab, 2 append. DACA 23-71-C-003.

Descriptors: *Incineration, *Burning, *Waste treatment, Ultimate disposal, Sewage disposal, Waste disposal.
Identifiers: Latrines, Human wastes.

An Army burn-out latrine was modified to improve its operational characteristics while maintaining simplicity of fabrication. Modifications to the original design consist of a method of metering fuel into a waste container and the addition of a burner stack assembly designed to reduce smoke by improving air-fuel mixture and detention time. These modifications were fabricated, operated, and tested under field conditions. The modified method of incinerating human excreta under field conditions has a substantial number of major limitations and drawbacks in the areas of fuel consumption, manpower requirements, and esthetic and hygiene considerations. The only clear-cut advantage to use of the modified burn-out latrine was production of less smoke. It was therefore concluded that development of this modifcation to the burn-out latrine produced no great advance toward solution of the problem of human excreta treatment and disposal under field conditions. The system is recommended only for situations requiring a temporary solution for a minimal number of individuals. Further effort should be devoted to alternative methods of human waste treatment and disposal. (Knapp-USGS)

Descriptors: *Industrial water, *Industrial wastes, *Food processing industry, Poultry, *Water reuse, *Waste water treatment, Operating costs, Waste treatment.
Identifiers: *Poultry processing industry, In-plant water management, In-plant waste control.

A typical broiler processing plant was used to evaluate changes in equipment and processing techniques to reduce water use and waste load. Production at the plant was through two processing lines and totaled approximately 70,000 broilers per day. Benchmark results indicated a water use of 12.28 gallons per bird received which was reduced by 32 percent to 7.81 gallons per bird which was reduced by 66 percent to 1355 lbs BOD5. Changes made are detailed and economic analysis showed all to be profitable for the plant with an average annual net savings of $4.08 per 1000 broilers processed. An initial investment of $93,065 was needed. Annual operating costs were $31,023 with annual net savings of $72,193. A water and waste management program is detailed. Microbiological analyses indicated no deterioration in product quality as a result of the changes. (EPA)

GRANITE INDUSTRY WASTEWATER TREATMENT,
Vermont Dept. of Water Resources, Montpelier. Agency of Environmental Conservation.
W. B. Farnham.
Copy Available from GPO Sup Doc as EP1.23:660/2-74-040, $1.45; microfiche from NTIS as PB-235 505 $2.25. Environmental Protection Agency Technology Series Report EPA-660/2-74-040, May 1974. 160 p, 8 fig, 45 tab, 5 ref. EPA Project 12080 GCH.

Descriptors: Water pollution, *Pollution abatement, Granites, Water pollution sources, Water pollution control, Water conservation, Waste water disposal, *Sludge disposal, Water reuse, *Vermont, *Waste water treatment, Separation techniques, Pilot plants, Byproducts, Lagoons, Settling basins.
Identifiers: Granite industry, Chemical treatment, *Granite processing wastes.

A study of wastewater discharge in the granite industry has been conducted to determine wastewater characteristics, methods of pollution abatement and disposal methods for waste granite sludge. The project included a study of overall water use in a granite plant, water optimization studies, and water reduction studies. Laboratory testing was conduced for waste characterization and liquid solids separation techniques. A pilot plant was designed, constructed and operated to test the efficiency of plant scale separation procedures. A prototype plant was designed and constructed to test the possibility of complete water reuse in the granite industry. Successful operation of both plants indicates that a practical method of treating granite waste effluent has been developed and that complete recycle of treated effluent is possible and economically feasible. Studies were performed to determine the possibility of by-product use of waste granite sludge. Two uses were found for the sludge, but an economic evaluation indicated that there was insufficient raw material to establish a by-product industry. A survey of sludge disposal methods in the industry showed that some modification of waste disposal facilities, and more cooperation by the industry, would improve the sludge disposal procedures. A modified type of settling lagoon was recommended. (EPA)

A WASTE TREATMENT SYSTEM FOR CONFINED HOG RAISING OPERATIONS,
Midwest Research Inst., Kansas City, Mo.
W. E. Park.
Copy available from GPO Sup Doc as EP1.23:660/2-74-047, $1.20; microfiche from NTIS, Springfield, Va 22161 as PB-235 558, $2.25. Environmental Protection Agency Technology Series Report, EPA-660/2-74-047, May 1974. 73 p, 2 fig, 9 tab. EPA Project 13040 EVM.

Descriptors: *Hogs, *Waste water treatment, *Aeration, *Settling basins, *Aerobic digestion, *Farm wastes, *Missouri, *Oxidation lagoons, Waste treatment, Capital costs, Operating costs, Waste disposal.
Identifiers: Odor control, Surface aerators, Flushing gutters.

A waste treatment system was installed in conjunction with an existing confined swine feeding operation at Schuster Farms, Gower, Missouri. The system consisted of a concrete aeration tank equipped with mechanical surface aerators, followed by a settling pond. Wastes from the 1,000-hog feeding operation were flushed through a gutter in the concrete feeding floor into the aeration tank, where they were aerobically digested. All aeration tank discharges were retained in the settling pond where the liquids evaporated. The waste treatment facility operated continuously and dependably over a 2-year period, with treatment efficiency averaging 90% to 95%. The system effectively controlled objectionable odors and insects, contained all liquid runoff emanating from the feeding operation, and left only a dry, inert residue suitable for land disposal. Installation cost for the system was $12,000. Net operating costs, including amortization of capital costs, were $7.33 per day. Thus, total environmental control was achieved at a cost of approximately $1.00 per hog, or 1/2 cent per pound (1.1 cent per kilogram) of weight gained while on the feeding floor. (EPA)

COLOR CHARACTERIZATION BEFORE AND AFTER LIME TREATMENT,
Institute of Paper Chemistry, Appleton, Wis.
H. S. Dugal, R. M. Leekley, and J. W. Swanson.
Copy available from GPO Sup Doc as EP1.23:660/2-74-029, $2.15; microfiche from NTIS, Springfield, Va 22161 as PB-235 493, $2.25. Environmental Protection Agency, Technology Series Report EPA-660/2-74-029, April 1974. 174 p, 62 fig, 42 tab, 21 ref, 5 append. EPA Project S 800853.

Descriptors: Effluents, *Waste water treatment, Chemical analysis, Water pollution, Tertiary treatment, Lime, Sewage treatment, *Industrial wastes, *Color reactions.
Identifiers: *Lime treatment, Massive lime treatment, Stoichiometric lime treatment, Kraft color, Neutral sulfite semichemical color, Kraft decker effluent, Kraft bleach effluent, Kraft caustic extract, *Color characterization, *Color isolation.

In general, lime treatment removed maximum color from the caustic extract and minimum from the neutral sulfite semichemical (NSSC) effluent. The massive lime treatment was found to remove 73 percent color and 53 percent total organic carbon (TOC) from kraft decker effluent, and 96 percent color and 80 percent TOC from kraft bleach caustic extract. The analysis of the solids from the decker and caustic effluents showed respective reductions of 73 and 59 percent phenolic hydroxyls, 63 and 26 percent sugars, and 51 and 16 percent methoxyls by lime treatment. The stoichiometric lime treatment was found to remove 79 percent color and 50 percent TOC from kraft decker effluent, and 64 percent color and 30 percent TOC from NSSC effluent. The analysis of the solids from the decker and NSSC effluents showed respective reductions of 76 and 25 percent phenolic hydroxyls, 31 and 'negligible' percent sugars, and 42 and 9.7 percent methoxyls by lime treatment. In the metal ion-lime system the addition of 150-300 ppm FeCl3 with only 300-500 ppm lime removed about 98 percent color from bleach caustic extract. Over 50 percent of the color left by conventional lime treatment process could also be removed by incorporating polyvalent metal ions with lime. However, below 1000 ppm of lime, the sludge obtained settled slowly. More color could be removed by metal ion-lime system than when each was used individually indicating that a 'synergistic' effect exists. (EPA)

PROTEIN PRODUCTION FROM ACID WHEY VIA FERMENTATION,
Milbrew, Inc., Juneau, Wis. Amber Lab. Div.
S. Bernstein, and T. C. Everson.
Copy available from GPO Sup Doc as EP1.23:660/2-74-025, $1.25; microfiche from NTIS, Springfield, Va 22161 as PB-235 504, $2.25. Environmental Protection Agency, Technology Series Report EPA-660/2-74-025, May 1974. 80 p, 9 fig, 9 tab, 12 ref, append. EPA Program Element 1BB037. Grant No. S-800747.

Descriptors: *Industrial wastes, *Fermentation, *Dairy industry, *Byproducts, *Proteins, Pilot plants, Yeasts, *Waste treatment, Waste water treatment.
Identifiers: *Dairy wastes, Continuous fermentation, Animal feeds, Cheese whey.

From the operation of a demonstration pilot plant over extended periods of time, it has been shown that yeast may be grown on an acid whey or sweet whey medium in a continuous, deep tank aerated fermentor. Variations in fermentation conditions, strain selection, and medium composition produced cell concentrations of several billion cells per milliliter. By a process of evaporation and spray drying the whole fermented whey mass and the utilization of the evaporator condensate to dilute incoming condensed whey, a high grade, non-toxic, protein feed material may be produced without any effluent streams. Amino acid analyses and protein efficiency ratios are presented for this feed material. Economic estimates show that while a large capital investment and low cost raw material are required for the commercial feasibility of this fermentation process, it will be competitive with other methods for the manufacture of single cell protein. This whey fermentation is one means of converting large quantities of a potential environmental pollutant into a useful and needed product. (EPA)

TREATMENT OF PACKINGHOUSE WASTES BY ANAEROBIC LAGOONS AND PLASTIC-MEDIA FILTERS,
Farmland Foods, Inc., Denison, Iowa.
D. A. Baker, A. H. Wymore, and J. E. White.
Copy available from GPO Sup Doc as EP1.23:660/2-74-027, $1.20; microfiche from NTIS, Springfield, Va 22161 as PB-235 566, $2.25. Environmental Protection Agency, Technology Series Report EPA-660/2-74-027, April 1974. 76 p, 10 fig, 38 tab, 8 ref, append. EPA Project 12060 DFF, Program Element 1BB037.

Descriptors: *Industrial wastes, *Waste treatment, *Trickling filters, *Waste water treatment,

Plastics, Anaerobic digestion, Flotation, Chlorination, Biochemical oxygen demand.
Identifiers: *Packinghouse wastes, *Anaerobic lagoons, Plastic media.

Studies were conducted to demonstrate the efficiency and suitability of using dissolved air flotation, anaerobic lagoons, plastic media trickling filters and chlorination as a system for treating 1 mgd of waste water from a meat packing plant. The primary objective was to determine if the plastic media filters could be used to replace the aerobic lagoon system normally used to treat the anaerobic lagoon effluent. The overall reduction of 5-day Biochemical Oxygen Demand (BOD5) through the system averaged 98.5% over the ten month evaluation period leaving a discharge concentration of 61 mg/l. Suspended solids were reduced 95.4% through the entire system, leaving an effluent concentration of 90 mg/l after chlorination. The BOD5 reduction in the anaerobic lagoons averaged 82% and accounted for the majority of BOD5 removed in the system. The BOD5 reduction through the plastic media trickling filters averaged 74% of the applied loading which was below the 91% efficiency expected during design. Hydraulic overload, organic overload, and possibly grease concentrations, contributed to the lower-than-expected performance. The cost of the treatment system was calculated to be $0.079 per hog killed or $0.344 per 1000 lb live weight killed. (EPA)

ACTIVATED SLUDGE PROCESS USING PURE OXYGEN,
Union Carbide Corp., Tonawanda, N.Y. Linde Div.
E. A. Wilcox, and S. O. Akinbami.
Copy available from GPO Sup Doc as EP1.23:670/2-73-042, $0.95; microfiche from NTIS, Springfield, Va 22161 as PB-235 572, $2.25. Environmental Protection Agency, Technology Series Report EPA-670/2-73-042, February 1974. 48 p. EPA Project 11010 FRN; 14-12-846, Program Element 1B2033.

Descriptors: *Oxygen requirements, *Activated sludge, Microorganism, Sedimentation rates, *Dissolved oxygen, Biochemical oxygen demand, *Waste water treatment, *Oxygenation.
Identifiers: *Oxygen activated sludge, Plug flow reactor, Mixed liquor, Alum addition, Phosphorus removal, Endogenous respiration, Sludge production.

The oxygen activated sludge system (UNOX) consisted of a unique, four stage, gas tight biological reactor that employed co-current gas-liquid contacting. In less than 1.85 hours of oxygenation, the system removed 90 percent of the influent BOD5 and utilized over 95 percent of the supplied oxygen. The microbial organisms visually were essentially the same as those found in a typical conventional system. Their rate of activity, however, was greater than those of the air system. Satisfactory solid-liquid separation was achieved at clarifier overflow rates varying between 300 and 1940 gallons per day per square foot. The clarifier underflow concentrations varied from 1.0 to 2.4 percent and mixed liquor suspended solids were maintained between 4000 and 7600 mg/l. Solids production averaged between 0.2 and 0.5 lb solids wasted per lb BOD removed. (Bishop-EPA)
W74-11799

A TEST METHOD FOR VOLATILE COMPONENT STRIPPING OF WASTE WATER,
Arkansas Univ., Fayetteville. Coll. of Engineering.
L. J. Thibodeaux.
Copy available from GPO Sup Doc as EP1.23:660/2-74-044, $1.70; microfiche from NTIS, Springfield, Va 22161 as PB-235 567, $2.25. Environmental Protection Agency, Technology Series Report EPA-660/2-74-044, May 1974. 130 p, 27 fig, 9 tab, 21 ref, 3 append. EPA Project R-801876.

Descriptors: *Waste water treatment, *Cooling towers, *Testing procedures, *Volatility, *Industrial wastes, Air pollution, Mass transfer, Biochemical oxygen demand, Chemical oxygen demand, Gas chromatography, Laboratory tests, Self-purification, Safety.
Identifiers: *Air stripping, *Desorption, Relative volatilization rate, Total organic carbon, Intalox saddle, Volatile organics, Acetone, Propanol, Methanol, Butanol, Furfural, Phenol.

The primary purpose was to develop laboratory apparatus and procedures that may be employed to assess the desirability of air-stripping in cooling towers as a treatment operation for removal of a portion of the organics from industrial waste water. The apparatus developed consists of a short packed (Intalox Saddle) section with liquid recirculation and single pass countercurrent air flow. Desorption is performed in the apparatus at 25C and ambient pressure conditions. Desorption experiments were performed on single pure components in water, simulated waste water preparations and actual industrial waste water samples. Industrial waste water samples were representative of: poultry, metal, oil-field, canning, pharmaceutical, paper, food, fibers, petroleum refinery and petrochemical industries. BOD, COD, TOC and gas chromatographic analysis were employed. Industrial waste waters were found to contain a non-volatile organic fraction that remains in the aqueous phase and a volatile organic fraction that can be transferred to the air phase. Results of one hour desportion runs indicate that the range of the volatile organic fraction is 0% to 70% TOC. The ultimate volatile range was calculated to be 0% to 98% TOC. The volatile organic fractions displayed a range of relative volatilization rates 4.4 to 41.6 times greater than water. The net result of the desorption experiments is that some industrial waste waters can be effectively treated by air-stripping a sizeable portion of the dissolved organics. (EPA)

COLOR REMOVAL AND SLUDGE DISPOSAL PROCESS FOR KRAFT MILL EFFLUENTS,
Continental Can Co., Inc., Hodge, La. Mill Operations Div.
E. L. Spruill, Jr.
Copy available from GPO Sup Doc as EP1.23:660/2-74-008, $1.65; microfiche from NTIS, Springfield, Va 22161 as PB-235 573, $2.25. Environmental Protection Agency, Technology Series Report EPA-660/2-74-008, February 1974. 124 p, 21 fig, 20 tab, 22 ref, 4 append. EPA Project 12040 DRY.

Descriptors: *Pulp and paper industry, *Waste water treatment, *Chemical precipitation, Lime, Color, *Sludge disposal, Physical properties, Centrifugation, Dewatering, Incineration, Ultimate disposal, Costs.
Identifiers: *Lime treatment, *Color removal, Kraft effluent, Kraft sludge disposal.

A treatment plant, removing color by lime addition and recovering sludges, has been treating over 80% of the effluent of an unbleached kraft mill for one year. Using up to 1,100 mg/l of CaO, with normal mill fiber loss as a precipitation aid, average color reduction was 80% for all-kraft effluent. At upper range of lime dosage, when residual dissolved Ca was above 400 mg/l as CaO, color removal was 85-93%. When mill production included 33-40% NSSC hardwood pulp, color reduction averaged only 65%. About 12% BOD5 reduction was observed, and average TOC reduction was nearly 40%. The chief negative factor is need for emergency protection against alkaline impact on secondary treatment and receiving stream. Following centrifuge dewatering, sludge incineration has had minimal impact on kiln operation; there were some adverse effects on lime quality. Lime recovery was 93%. Mill kiln capacity must be increased about 25%. Primary clarification and sludge disposal are included in the process. Operating costs, exclusive of capital factors, are estimated at $0.50-$0.80 per ton of paper, or 5.5 cents to 6.5 cents per thousand gallons, depending on fiber losses and water usage. (EPA)
W74-11803

ANAEROBIC-AEROBIC LAGOON TREATMENT OF DAIRY MANURE WASTES,
Washington State Univ., Pullman. Engineering Research Div.
D. E. Proctor.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 574, $6.00 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA 660/2-74-030, May 1974. 47 p, 10 fig, 7 tab, 6 ref. Grant No WPD 184-01-67. EPA Project 13040 DFN.

Descriptors: *Waste water treatment, *Activated sludge, *Aerobic treatment, *Anaerobic digestion, *Farm lagoons, Foam separation, Harvesting of algae, Dairy industry, Farm wastes, *Nutrient removal, Pacific Northwest U.S.
Identifiers: Dairy manure, Anaerobic lagoons.

The removal of manure from diary cattle confinement areas by improved hydraulic flushing techniques was attempted in conjunction with an attempt to treat the resulting manure slurry in an anaerobic lagoon and activated sludge process. Algae cells were allowed to propagate in the activated sludge process effluent in an attempt to then harvest the cells and accomplish nutrient removal as a final polishing step. While manure could be hydraulically moved by high velocity flushing jets, it resulted in a slurry that was too thick to flow by gravity to catch basins within the cattle confinement areas. The anaerobic lagoon-activated sludge process sequence did accomplish overall pollutional strength reductions as high as 90%. The activated sludge process effluent was still too high in organic strength, color, and nutrients to be discharged to surface waters, however. Dissolved air flotation of algae cells produced in shallow propagation ponds was ineffective. (Boydston-EPA)

PROCEEDINGS OF CONFERENCE ON LAND DISPOSAL OF MUNICIPAL EFFLUENTS AND SLUDGES,
Environmental Protection Agency, New York.
R. W. Mason, and C. E. Hess.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-227 115, $16.50 in paper copy, $2.25 in microfiche. Conference Held March 12-13, 1973, at Rutgers, The State University of New Jersey, 1973. 261 p.

Descriptors: *Conferences, *Municipal wastes, Effluents, Land treatment, Environmental effects, Public health, Sludge disposal, Sewage sludge, Waste water treatment, Municipal sludge, *Waste disposal, *Water reuse.
Identifiers: *Land disposal, Treatment methods.

The proceedings of a conference sponsored by the United States Environmental Protection Agency and the College of Agriculture and Environmental Science of Rutgers University includes 19 articles. These deal with both sludge disposal on land and with the land treatment of municipal effluents. The mechanics and problems of land disposal as applied to specific municipalities, as well as environmental and social effects are discussed. (See also W74-11834 thru W74-11852) (Prague-FIRL)
W74-11833

SLUDGE CHARACTERISTICS OF MUNICIPAL SOLIDS,
Rutgers - The State Univ., New Brunswick, N.J. Coll. of Agriculture and Environmental Science.
A. J. Kaplovsky, and E. Genetelli.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 3-18, 1973. 6 tab.

Descriptors: *Sludge, *Sludge disposal, Landfills, Municipal wastes, Economics, Farm management, Feasibility.
Identifiers: *Sludge characteristics.

The practice of land disposal is analyzed historically emphasizing that the degree of sophistication is dependent upon the local, social, and economic conditions as well as the sludge characteristics. The formation of sludge from municipal wastes and solids handling are reviewed, with the composition of the sludge being calculated. In light of existing constituent composition found in waste sludges, the inherent concentration variability and the many factors which must be considered for crop management, the true feasibility and economics of land disposal are largely unanswered. More specifically, the practices of ultimate disposal, management, and economic and social implications are directly or indirectly related to the composition and character of the material requiring disposal. (See also W74-11833) (Sandoski-FIRL)
W74-11834

DISPOSAL AND REUSE OF SLUDGE AND SEWAGE: WHAT ARE THE OPTIONS,
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
R. B. Dean.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 19-30, 1973. 1 fig, 1 tab, 8 ref.

Descriptors: *Sludge disposal, Landfills, Water reclamation, Organic matter, Minerals, Nitrogen, Phosphorus, Potassium, Zinc, Lime, Heavy metals, Salts.
Identifiers: *Sludge characteristics.

Some of the properties and quantities of municipal waste solids are reviewed briefly. Sludge when applied to the land is discussed in general with regard to water, organic matter, and inert minerals, and specifically with regard to nitrogen, phosphorus, potassium, zinc, lime, heavy metals, and salts. (See also W74-11833) (Sandoski-FIRL)
W74-11835

SOILS AS SLUDGE ASSIMILATORS,
Forest Service (USDA), Washington, D.C. Div. of Forest Environment Research.
J. O. Evans.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 31-52, 1973. 1 tab, 10 ref.

Descriptors: *Soil chemical properties, *Soil physical properties, *Sludge, Soil disposal fields, Soil microorganisms, Soil management, Soil investigations, Soils.

Factors which determine the relative ability of soils to act as sludge assimilators are presented. Soil properties that facilitate sludge assimilation such as ion exchange capacity and buffer capacities, soil filterability and microbial transformations, and various application techniques are discussed. Physical factors relating to sludge assimilation (sldge characteristics, physical soil characteristics, climatic, biotic, and land influences, and loading rates), and the sludge chemical analysis and soil chemistry, and micro- and macro-organisms are discussed. (See also W74-11833) (Sandoski-FIRL)
W74-11836

MODES OF TRANSPORTING AND APPLYING SLUDGE,
Bauer Engineering, Inc., Chicago, Ill.
W. J. Bauer.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 53-66, 1973. 1 fig, 2 tab.

Descriptors: *Sludge disposal, *Application methods, Transportation, Dewatering, Pipelines, Barges, Roads, Railroads, Economics, Comparative costs, Comparative benefits.

Alternative methods for dewatering, transporting, and applying sludges resulting from treatment of municipal sewage are discussed. Sludge characteristics, costs of dewatering, and hydraulic characteristics are generalized. Pipeline, truck, barge, and rail transportation systems are discussed. Five application methods are presented with the preferred being the plowing in of a slurry fed continuously through a hose to a moving plow. Illustrated are various combinations of systems and their economic significance is described. (See also W74-11833) (Sandoski-FIRL)
W74-11837

SOME CONSTRAINTS OF SPREADING SLUDGE ON CROPLAND,
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
G. K. Dotson.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 67-79, 1973. 15 ref.

Descriptors: *Sludge disposal, *Farm management, *Nitrogen, *Toxicity, Heavy metals, Trace elements, Pathogenic bacteria, Sewage sludge, Application methods.

The composition of sewage sludge is discussed emphasizing nitrogen, metals, and pathogens. The various aspects of soil nitrogen include mineralization, digestion, denitrification, plant uptake, and runoff removal. The fate of heavy metals, trace elements toxicity, and the permissive levels of trace elements also are reviewed. Methods of pathogenic destruction are mentioned as well as the application of sewage sludge to soil for crop production and/or soil improvement. (See also W74-11833) (Sandoski-FIRL)
W74-11838

METHODS OF LIQUID FERTILIZER APPLICATION,
Metropolitan Sanitary District of Greater Chicago, Ill.
B. T. Lynam, and R. O. Carlson.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 81-90a, 1973. 3 fig, 1 ref.

Descriptors: *Sewage sludge, *Sludge disposal, Organic matter, Crop production, Nutrients, Irrigations systems, Fertilizers, Flood irrigation, Transportation, Application methods, *Illinois, Water reuse.
Identifiers: *Chicago(ILL), Manifolds.

The Metropolitan Sanitary District of Greater Chicago, Illinois applies anaerobically digested sewage sludge to strip mine land to restore its organic matter content and to supply plant nutrients for crop production. The methods of application include: a tank truck equipped with a manifold across the rear end; various irrigation systems; and an incorporation method that is being developed. Each of the systems is described briefly. (See also W74-11833) (Sandoski-FIRL)
W74-11839

EQUIPMENT FOR INCORPORATING SEWAGE SLUDGE AND ANIMAL MANURES INTO THE SOIL,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Biological and Agricultural Engineering.
C. H. Reed.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 91-100a, 1973. 6 ref.

Descriptors: *Equipment, *Sewage sludge, *Sludge disposal, *Farm wastes, Soil disposal fields, Application equipment.
Identifiers: *Land application.

The incorporation of wastes directly into the soil is superior to surface spreading because there is no odor, no opportunity for flies or other pests to feed or breed, and no runoff or surface erosion of wastes. Also, the wastes are placed in the best possible media for immediate degradation to plant nutrients and utilization by plants. The design of an effective land treatment system and the selection of appropriate equipment necessitates the consideration of many factors, some of which are outlined. Presented are equipment and devices used for such application techniques as the ridge-and-furrow method, sub-sod-injection, and plow-furrow-cover. (See also W74-11833) (Sandoski-FIRL)
W74-11840

SLUDGE DISPOSAL STUDIES AT BELTSVILLE,
Agricultural Research Service, Beltsville, Md. Biological Waste Management Lab.
J. M. Walker.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 101-116, 1973. 2 fig, 3 tab.

Descriptors: *Onsite tests, *Laboratory tests, *Sewage sludge, *Sludge disposal, *Soil management, Crop production, Toxicity, Pathogenic bacteria, Nitrogen, Zinc, Nickel, Cadmium, Copper, Soil disposal fields, *Maryland.
Identifiers: *Beltsville(MD).

Results of four field studies and a number of laboratory studies on the use of dewatered sewage sludge for soil improvement are highlighted. The primary concern has been with what limits the amount of sludge can be safely applied to soils. These limitations were grouped into categories: short-term limitations including the initial toxicity of sludges to plants, pathogen presence and survival, and excessive quantities of nitrogen; and, toxicity from heavy metals such as zinc, cadmium, copper, and nickel. The research goal has been to use sewage sludge to improve soils at a reasonable cost, with minimum hazard to health, and with minimum soil and water pollution. (See also W74-11833) (Sandoski-FIRL)
W74-11841

MERCHANDISING HEAT-DRIED SLUDGE,
Milwaukee Sewerage Commission, Wis.
C. G. Wilson.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 117-123, 1973.

Descriptors: *Sludge disposal, *Activated sludge, *Byproducts, Crops, Fertilizers.
Identifiers: *Sludge merchandising, Milwaukee(WI), Milorganite.

Employing the activated method of municipal sewage disposal since 1920, the city of Milwaukee, Wisconsin has used heat-dried sludge, named Milorganite, to help offset costs. In merchandizing such sludge, the following points have been found important: knowledge of what the byproduct can and cannot do in growing plants; national market to balance seasonal and climatic variables; sales based on agronomic service; and, a strong distribution system. (See also W74-11833) (Sandoski-FIRL)
W74-11842

OCEAN COUNTY SEWERAGE AUTHORITY WASTE WATER SOLIDS UTILIZATION ON LAND DEMONSTRATION PROJECT,
Ocean County Sewerage Authority, N.J.
M. Gritzuk.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 125-132, 1973. 2 fig.

Descriptors: *Pilot plants, *Sludge disposal, Application methods, Sites, Monitoring, Comparative costs, Evaluation, Soil disposal fields, Sewage sludge, *New Jersey.
Identifiers: *Ocean County(NJ).

Ocean County, New Jersey will soon start construction of a sewerage system that will produce about 25,000 dry tons of sludge annually. A demonstration project has been initiated to determine if sludge reuse is possible, economically feasible, and environmentally desirable for the County. The following project aspects are outlined: sludge characteristics for reuse; goals; activities such as site selection, application methods, hydrologic and geologic characteristics, soil conditions and vegetation, atmospheric and meteorological monitoring, loading rates, aesthetic evaluation; and cost comparisons. (See also W74-11833) (Sandoski-FIRL)
W74-11843

EPA VIEWPOINT ON LAND APPLICATION OF LIQUID EFFLUENTS,
Environmental Protection Agency, Washington, D.C. Office of Research and Monitoring.
J. R. Trax.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 133-142, 1973.

Descriptors: *Municipal wastes, *Land management, *Federal project policy, Irrigation systems, Crop production, Infiltration, Overland flow, Application methods, *Waste disposal, Liquid wastes, *Water reuse.
Identifiers: Opinions, Land application.

Land treatment can be divided into the following categories: infiltration-percolation, cropland irrigation, spray-runoff, and solids benefaction. Approximately 14 percent of the total budget for fiscal 1974 for the EPA Municipal Technology Research Program, or about $1.2 million, is planned for development of land treatment technology which includes sludge application to the land. The philosophy behind the Program is outlined. (See also W74-11833) (Sandoski-FIRL)
W74-11844

LAND TREATMENT AND ENVIRONMENTAL ALTERNATIVES,
Natural Resources Defense Council, Washington, D.C. Project on Clean Water.
B. Reid.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 143-150, 1973.

Descriptors: *Water pollution control, *Land management, *Waste water treatment, Waste disposal, Performance, Costs, Public health, Political aspects.

Statistics and examples of problems of water pollution and its control are presented, emphasizing the need for zero discharge of pollutants and proposing land disposal as a viable, natural alternative. Land treatment is defined as a complex system which must be carefully planned and engineered to assure that the rate of application of treated waste water conforms to local climate so as not to overload the desired treatment levels. Questions are raised on the following four considerations of land treatment: performance; costs, in terms of capital, operations, outlays, and returns or profits; political acceptance; and, public health. (See also W74-11833) (Sandoski-FIRL)
W74-11845

NEW YORK STATE'S VIEW OF LAND DISPOSAL,
New York State Dept. of Environmental Conservation, Albany. Bureau of Municipal Wastes.
F. O. Bogedain.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 151-164, 1973. 2 tab, 7 ref.

Descriptors: *Land management, *Waste disposal, Waste water treatment, *New York, Sewerage, Research and development, Municipal wastes, Industrial wastes,
Identifiers: *Land disposal.

A history of the initiation and implementation of the land disposal method for waste water is described briefly. Municipal, industrial, and individual system statistics are mentioned. The following conclusions are drawn as regarding the State of New York and its position on land disposal. Land disposal is an established method of waste disposal, but is little used. Numerous problems can be encountered with this approach even when competent planning, design, construction, and operation stages are not omitted. More detailed studies of the increasingly larger installations are needed to assist in decisions involving the use of land disposal. (See also W74-11833) (Sandoski-FIRL)

PROTECTION OF THE PUBLIC HEALTH,
Army Medical Environmental Engineering Research Unit, Aberdeen Proving Ground, Md.
C. A. Sorber.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 201-209, 1973. 4 ref.

Descriptors: *Public health, *Waste water treatment, *Land management, Waste disposal, *Waste water disposal, Pretreatment(Water), Water pollution control.

The public health aspects of waste water treatment by land disposal are dependent upon a number of variables, the most important of which is the ultimate use of the waste water. Another area of importance is the degree of pre-treatment for the waste water prior to land disposal. The effects of these prime variables are grouped into the areas of physical, biological, and chemical considerations. Few public health problems would exist as a result of spray irrigation or land disposal of waste water if basic steps such as site selection and planning with regard to aforementioned considerations were taken into account when designing and implementing a land disposal field. (See also W74-11833) (Sandoski-FIRL)
W74-11849

EXPERIENCES WITH LAND SPREADING OF MUNICIPAL EFFLUENTS,
Robert S. Kerr Water Research Center. Ada, Okla.
R. E. Thomas, and C. C. Harlin, Jr.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 211-225, 1973. 1 tab, 8 ref.

Descriptors: *Land management, *Municipal wastes, *Waste disposal, Waste water treatment, Waste water disposal, *Water reuse, *Irrigation systems, Soil-water-plant relationships, Research and development, Federal project policy, *Overland flow.
Identifiers: *Infiltration-percolation.

The Environmental Protection Agency's involvement in land spreading of municipal effluents for treatment and/or reuse is summarized. Three areas of interest include infiltration-percolation, cropland irrigation, and spray-runoff which have well-defined differences regarding land area requirements and the resulting interactions with the plant, soil, and water components of localized ecosystems. W74-11850

NATIONWIDE EXPERIENCES IN LAND TREATMENT,
Metcalf and Eddy, Inc., Palo Alto, Calif.
C. E. Pound, and R. W. Crites.
In: Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 227-244, 1973. 1 fig, 6 tab, 21 ref.

Descriptors: *Waste water disposal, *Waste water treatment, *Overland flow, Investigations, *Design, Environmental effects, Costs, Administration, Public health, Safety, Sites, *Irrigation.
Identifiers: *Infiltration-percolation, Site characteristics, Waste water characteristics.

The three basic modes of land application of waste water are crop irrigation, overland flow or spray-runoff, and infiltration-percolation. The methods are presently being studied to determine the following objectives: key parameters for design, effects on the environment, health and safety risks, costs, and additional study areas. Site and waste water characteristics are reviewed and general statistics are given for the three modes. A detailed description including design, management, costs, and health aspects, is included only for the crop irrigation systems. (See also W74-11833) (Sandoski-FIRL)
W74-11851

A SURVEY OF LAND APPLICATION OF WASTE WATER FACILITIES,
American Public Works Association, Chicago, Ill.
R. H. Sullivan.
In: Proceedings of Conference on Land Disposal and Municipal Effluents and Sludges, March 12-13, 1973, Rutgers University, New Brunswick, New Jersey, p 245-261, 1973.

Descriptors: *Surveys, *Waste disposal fields, *Municipal wastes, *Industrial wastes, Land management, Application methods, Soil types, In-

stallations, Irrigation systems, *Treatment facilities, *Water reuse.

A field survey of 100 facilities where land application of domestic and industrial waste water effluents was utilized gave the following results: communities generally use their land application system on a continuous basis; ground cover utilized for municipal systems is divided between grass and crops; land application systems are generally used on a daily basis; and application rates for crop irrigation are very low in terms of inches of water per week. Many types of soils were used, with sand, loam, and silt the most common. Most operating agencies are planning to expand or continue their installations; industries surveyed treat their total waste flow by land application; secondary treatment is generally provided by municipalities prior to land application; spray irrigation is the most frequently used method of application. Land use zoning for land application sites is predominantly classified as farming. Waste water generally is transported to the application site by pressure lines; many community land application facilities have been in use for several years, more than half for over 15 years. Renovated waste water is seldom collected by underdrains. Land application facilities do not make efforts to preclude public access and water, soil uptake, and crop uptake monitoring is not carried out with any consistency. RAIN RETENTION BASINS AND RAINWATER DISCHARGES (REGENBECKEN UND REGENENTLASTUNGEN),
W. Munz.
Gas - Wasser - Abwasser, Vol 54, No 3, p 98-110, April, 1974. 40 fig, 13 tab, 2 ref.

Descriptors: *Rainwater, *Settling basins, *Sewer systems, Flow rates, Canal design, Costs, Design criteria.
Identifiers: *Rainwater discharges, *Rain retention basins, Runoff yield.

Examples for the calculation of rainwater retention basins and compound basins, a combination of retention basin and settling basin, for complex sewer systems are presented. While both rainwater retention and settling basins are usually designed for a rain intensity of 40 liter/sec that occurs at a probability of about 10 times yearly, it is acceptable to reduce this value to 30 liter/sec to cut investment costs. Detailed calculations of runoff yield, inlet canal, heights of basin and canal, settling basin surface area, overflows, flow rates, and retention volumes are described. (Takacs-FIRL)
W74-11854

FURTHER PURIFICATION OF BIOLOGICALLY TREATED WASTE WATER TREATMENT PLANT EFFLUENTS BY MEANS OF MICROSTRAINERS (WEITERREINIGUNG BIOLOGISCH BEHANDELTER KLAERANLAGENABLAEUFE MIT HILFE VON MICROSTRAINERN),
B. Hanisch.
Gas-Wasser-Abwasser Vol 54, No 3, p 75-77, April, 1974. 6 fig.

Descriptors: *Water purification, *Waste water treatment, *Filtration, *Biological treatment, *Equipment, Suspended solids, Retention, Biochemical oxygen demand, Ultraviolet radiation, Filters, Costs.
Identifiers: *Microstrainers, Treatment plants, Suspended matter, Germany.

The principle and use of microstrainers for the reduction of the suspended matter content in biologically purified effluents in waste water treatment plants are described. The microstrainer is composed of a horizontal, slowly rotating drum covered by fine wire mesh serving as filter. The suspended matter settling on the inside of the drum acts as an additional filter. The proliferation of Zooglea is prevented by UV irridation. Experiences from the practical use of microstrainers in connection with biological waste water treatment plants and percolation bodies show that microstrainers are able to retain up to 60 percent of the suspended matter content, and to reduce the residual BOD content by about 50 percent. While the suspended matter retention efficiency of microstrainers is lower than that of rapid sand filters, microstrainers are superior to the latter in terms of lower investment costs and reduced susceptibility to great load variations. (Prague-FIRL)
W74-11856

BIOLOGICAL TREATABILITY OF LANDFILL LEACHATE,
Wisconsin Univ., Madison. Dept. of Civil and Environmental Engineering.
W. C. Boyle, and R. K. Ham.
Journal of the Water Pollution Control Federation, Vol 46, No 5, p 860-872, May, 1974. 4 fig, 14 tab, 5 ref.

Descriptors: *Biological treatment, *Biochemical oxygen demand, *Landfills, Pollutants, Organic matter, *Anaerobic treatment, Domestic wastes, Activated sludge, Oxygen, Solids, Liquors, Effluents, *Waste water treatment.
Identifiers: *Landfill leachates, Organic pollutants.

A substantial portion of the organic pollutants in sanitary landfill leachate can be removed by biological treatment. Anaerobic treatment of raw leachate provided more than 90 percent BOD reduction for hydraulic detention times greater than ten days at temperatures of 23 to 30C. Aerobic polishing of the anaerobic effluent produced BOD values proportional to surface water discharge. Leachate can be added to domestic waste water in an extended aeration activated a sludge plant at a level of at least five percent by volume without serious impairment of quality. At greater than five percent, leachate additions caused substantial solids production, increased oxygen uptake rates, and poorer mixed liquor separation. (Murphy-FIRL)
W74-11857

JET AERATOR HAS HIGH OXYGENATION CAPACITY.
Chemical Engineering, Vol 81, No 10, p 70, May 13, 1974.

Descriptors: *Jets, *Aeration, *Oxygen, Basins, Biochemical oxygen demand, Chemical oxygen demand, Equipment, Efficiency, Pumps, Lagoons, Oxidation, Liquors, Streams, Mixing, *Waste water treatment.
Identifiers: *Jet aeration, Basin geometry, Tank depth.

A jet aeration system has been developed which consumes less power and is much cheaper than pure-oxygen processes. Its system design is based on oxygenation capacities calculated from temperature, solids concentration, basin geometry, BOD, COD, and equipment efficiencies. The Eddy-Mix Jet Aeration system features fiber-flass ductwork, submersible heavy-duty pumps and large-diameter jets, and can be used in waste lagoons, oxidation ditches, or aeration tanks. Compressed air and recirculating liquor are brought into the jet and form small, entrained bubbles. The mixture is discharged on the bottom in a horizontal stream. Plumes are formed which provide turbulence. Unlike surface aeration systems, mixing is not limited by tank depth. (Murphy-FIRL)
W74-11858

VORTEX CLARIFIER ACHIEVES FAST SEPARATIONS.
Canadian Chemical Processing, Vol 58, No 4, p 32-33, April, 1974. 1 fig.

Descriptors: *Separation techniques, *Vortices, *Installation, Liquids, Solids, Water pollution control, Equipment, *Canada, Solids, *Waste water treatment.
Identifiers: *Vortex clarifier, Kingston, Ontario, Forced vortex, Retention time, Acceleration, Immiscible liquids.

A new clarifier has been designed by Queen's University Engineering Department, Kingston, Ontario and will have its first commercial use and installation by 1975. This clarifier will process 200 gallons per minute or more of liquids which contain less than one percent solids. It is designed to bridge the gap between centrifuges and settling tanks used for this purpose. The Bird Machine Company will use this 'forced vortex' in which the liquid in the cone rotates as if it were a solid body, minimizing fluid shear and hence turbulence. By applying large rotational accelerations (500 to 2000 g) the particles quickly agglomerate and reduce retention time to 40 seconds (rather than hours in a settling tank). Applications being considered are in recovering fibers from paper mill effluents and the reduction of water pollution. Possible future used include separation of immiscible liquids. (Prague-FIRL)
W74-11859

GAMMA RADIATION AS AN EFFECTIVE DISINFECTANT,
McMaster Univ., Hamilton (Ontario). Dept. of Chemical and Civil Engineering.
K. L. Murphy.
Water and Pollution Control, Vol 112, No 4, p 24, 26, 28, April, 1974. 5 fig, 7 ref.

Descriptors: *Gamma rays, *Cobalt radioisotopes, *Disinfection, *Chlorination, Chlorine, Potable water, Water treatment, Laboratory tests, Energy, Contamination, Pilot plants, Toxicity, Fish, *Waste water treatment, *Canada.
Identifiers: *Gamma radiation, Cobalt 60, Laboratory studies, Energy consumption, Ontario.

Gamma radiation has not been used a disinfectant for waste waters primarily because of costs. However, while chlorine is currently the most widely used disinfectant for potable water treatment, serious questions have been raised about both its effectiveness and its possible toxicity over time. A further disadvantage of chlorine is its high energy consumption, especially in time of energy shortages. By laboratory studies, gamma radiation from radioactive cobalt 60 has been demonstrated to be an effective disinfectant; it cannot induce radioactivity or add to contaminants present. A pilot plant in Georgetown, Ontario was designed to test reactor efficiency, disinfecting ability of radiation, reactor performance, effect on soluble organics, and toxicity effects. Significant results on effectiveness of treatment and reproduction of an effluent non-toxic to fish were shown. Costs of cobalt are presently half the price of ten years ago. This coupled with a lower energy consumption as compared to chlorine, could make gamma radiation a viable alternative as a waste water disinfectant. (Prague-FIRL)
W74-11860

BRANDON SEWAGE PLANT FEATURES NOVEL CLARIFIER.
Water and Pollution Control, Vol 112, No 4, p 50-52, April, 1974.

Descriptors: *Waste water treatment, *Sewage treatment, *Biological treatment, *Aeration, *Anaerobic treatment, *Jets, Lagoons, Treatment facilities, Pilot plants, Clarification, Oxygen, Solids, Sludge, Temperature, Rivers, Bubbles, *Canada, Cold regions.
Identifiers: Settleable solids, Anaerobic lagoons, Aeration tanks, Penberthy jets, Brandon(Manitoba), Fine bubbles.

Specific problems exist in cold regions such as Brandon, Manitoba, where biological sewage treatment processes are difficult to maintain by conventional anaerobic lagoon methods. A new treatment facility is essentially an extended aeration plant, incorporating an aeration tank in which Penberthy jets are installed. These produce a stream of water and air simultaneously, and react to produce a fine bubble. These jets promote complete mixing action and are not prone to freezing, as the aerator is always submerged. Using a pilot plant, it was found that a completely-mixed system with effective clarification and sludge return is a very efficient system; it should not be critically affected by temperature variation, sludge quantity, or variation in oxygen content. An additional feature of the Brandon plant is a clarifier which removes settleable solids. This is done by a tube or set of tubes or a channel with flushing in the direction of the flow, with flushing water either directed to a separate basin or returned to the original basin. Essentially 100 percent of the sludge from the clarifier is returned to the aeration tank and eventually will be waste into the lagoon system. A full cycle of sewage treatment will consist of 24 hours of aeration, followed by clarification before discharge to a lagoon for three weeks storage, then cascading down an open channel to re-absorb a maximum oxygen before discharge to a river. B. Intorre, and P. DeRienzo.
Hudson River Colloquium, Annals of the New York Academy of Sciences, Vol 250, p 169-177, May 24, 1974. 3 fig, 1 tab.

Descriptors: *Power plants, Boilers, Condensers, Turbines, Generators, *Industrial wastes, *Estuaries, Water pollution sources, Cooling water, Waste water treatment, *Treatment facilities.

The three major components of a power plant are a boiler or reactor, used to release the chemical or nuclear energy in the fuel by producing steam; a turbine generator, which converts the mechanical energy into electrical energy; and, a condenser which converts any remaining energy in the steam to the river water used for cooling. The operation of these components in an overall power cycle is discussed, highlighting those operations that generate potential contaminants. (Sandoski-FIRL)

SEWAGE ELECTROLYSIS,
Toronto Univ. (Ontario). Dept. of Civil Engineering.
N. S. Wei, and G. W. Heinke.
Water and Pollution Control, Vol 115, No 5, p 31-32, 36, May, 1974.

Descriptors: *Reviews, *Electrolysis, *Sewage treatment, Chemical reactions, Patents, Technology, *Waste water treatment.

A state-of-the-art review of sewage electrolysis is presented. Electrolysis is a process in which chemical reactions are induced at each electrode-liquid interface through the application of an external electrical energy source to a system of electrodes immersed in a liquid. The review traces the commercial and scientific development of the process and includes an extensive patent survey. (Sandoski-FIRL)

PUBLIC USE AND EVALUATION OF RECLAIMED WATER,
California Univ., Berkeley. School of Public Health.
W. H. Bruvold, and H. J. Ongerth.
Journal of the American Water Works Association, Vol 66, No 5, p 294-297, May, 1974. 5 tab, 7 ref.

Descriptors: *Water reuse, Recreation facilities, Research and development, Evaluation, Surveys, *California, *Water utilization, *Attitudes, *Reclaimed water.
Identifiers: *Public opinion.

Insight into what the public currently thinks of various uses of reclaimed water has been developed through large-scale systematic research. The aims of present research are as follows: to study behavior of individuals regarding existing recreational facilities using reclaimed water; to measure attitudes toward various specific uses of reclaimed water; and, to develop the implications of the findings for innovative reuse projects. A summary of the methodology of the major field work, followed by general and attitudinal results are presented. Results are discussed and recommendations made. (Sandoski-FIRL)

RECOVERY OF HEAVY METALS FROM WASTE ACID (HAISAN KARA NO JUKINZOKU NO KAISHU),
A. Matsumura, Y. Matsuda, K. Masuyama, K. Murakami, and T. Imamura.
Sumitomo Denki, No 108, p 20-26, March 1974. 12 fig, 3 tab. English summary.

Descriptors: *Heavy metals, *Nickel, *Chemical wastes, *Waste water treatment, Separation techniques, Iron, Neutralization, Electrolysis, Copper, Chromium, *Acids.
Identifiers: *Japan.

The treatment of waste acid containing heavy metals has posed a problem in Japan even prior to the initiation of environmental control. A method for treating such acid waste has been investigated which permits the recovery of such valuable metals as copper, nickel, and chromium. Described is a process for separating nickel and iron by stepwise neutralization and recovering this nickel by electrolysis. (Sandoski-FIRL)

INDUSTRIAL WASTE WATER RECOVERY AND REUSE,
Betz Environmental Engineers, Inc., Plymouth Meeting, Pa. Dept. of Industrial Concept Design.
A. F. McClure.
Journal of the American Water Works Association, Vol 66, No 4, p 240-243, April, 1974. 3 photos.

Descriptors: *Recycling, *Industrial wastes, *Waste water treatment, Adsorption, Resins, Ion-exchange, Cations, Anions, Reverse osmosis, *Water reuse.

Ideas are presented about how industry may be able in the near future to treat a waste water stream and then, instead of discharging it, recycle it through all or part of the manufacturing process. Types of industrial reuse, the role of consultants, role of industrial management, and role of water-utility personnel were discussed. Treatments for reuse were discussed. It was emphasized that there are no set programs, but the following examples were cited: (1) Granular activated carbon provides for removal of organics by the adsorption of organic molecules. Although not the primary function, it will act as a filter and remove suspended solids; (2) Organic-adsorbent resins can be used to remove water-soluble organic materials from water; (3) Ion-exchange resins depending upon regenerant and resins used, can remove both cations and anions; (4) Electrodialysis uses an electric current to transport salts and other ionized materials through salt-permeable membranes; (5) Reverse osmosis uses pressure, in excess of osmotic pressure, to pass relatively pure water through a semipermeable membrane. SOIL SYSTEMS FOR MUNICIPAL EFFLUENTS - A WORKSHOP AND SELECTED REFERENCES,
East Central State Coll., Ada, Okla. School of Environmental Science.
R. H. Ramsey, C. R. Wetherill, and H. C. Duffer.
Copy available from GPO Sup Doc as EP1.16:16080 GWF 02/72, $0.65; microfiche from NTIS, Springfield, Va 22161 as PB-217 853, $2.25. Environmental Protection Agency, Water Pollution Control Research Series, February 1972. 58 p, 2 tab, 111 ref, 2 append. EPA Project 16080 GWF 02/72.

Descriptors: *Irrigation, *Infiltration, *Percolation, Bibliographies, Reviews, *Recycling, *Municipal wastes, *Water reuse, Waste disposal, Effluents, Soils.
Identifiers: *Soil systems, Workshop, User manual, State of art reports.

An investigation of the use of Soil Systems for recycling treated municipal waste effluents was conducted. The scope of the project included: the preparation of a user manual entitled Applying Treated Municipal Wastewater to the Land: Current Technology and an annotated bibliography of selected references in subject area. A state of the art investigation was made of the design, operation and control of irrigation and infiltration-percolation types of soil systems. The summarized results from this investigation were used by workshop participants selected from state, municipal, and federal agencies who were involved in soil system activities as a starting point in writing the manual. The workshop culminated in the preparation of a draft of the manual. The bibliography contains selections which portrayed or influenced the present state of art in the subject field. (EPA)

DEMONSTRATION OF A FULL-SCALE WASTE TREATMENT SYSTEM FOR A CANNERY,
Oklahoma Univ. Research Inst., Norman.
Leale E. Streebin, George W. Reid, and Alan C. H. Hu.
Copy available from GPO Sup Doc as EP1.16:12060 DSB 09/71, $1.50; microfiche from NTIS, Springfield, Va 22161 as PB-215 416, $2.25. Environmental Protection Agency, Water Pollution Control Research Series, September 1971. 181 p, 85 fig, 19 tab, 43 ref, 5 append. EPA Contract No 12060 DSB 09/71.

Descriptors: *Industrial wastes, Waste treatment, *Canneries, *Aerobic treatment, Sanitary engineering, Aeration, Biological treatment, *Waste water treatment, Food processing industry, *Activated sludge, Recycling.
Identifiers: *Food wastes, Waste characteristics, Aeration(Two-stage).

The objectives were to determine the removal efficiencies of a two-stage aerobic biological treatment system while processing high strength, large volume, nutritionally unbalanced cannery wastes, and to determine the waste characteristics resulting from the processing of a wide variety of fruits and vegetables. The system was studied over one operating season and data were collected on the removal efficiencies of each unit process in the system. The treatment system performed more efficiently than expected in the design assumptions. Removal efficiencies of greater than 95% were obtained for most of the processing season, even though because of plant expansion the organic and hydraulic load was higher than expected. It has been demonstrated conclusively that: (1) The Stilwell canning wastes can be treated successfully by a two-stage activated sludge process; (2) The two-stage aeration process is very stable and capable of accepting shock loads without being adversely affected; (3) The two-stage aeration process is a flexible system allowing adequate capacity for varying waste loads; that is, the units can be operated individually or in combination to match the flow and strength variations. This provides high treatment efficiencies at the lowest operational cost; (4) Any one of the units, such as the minimal solids unit, can be started up readily by recycling the mixed liquor from one of the operating units. TREATMENT OF WASTE WATER FROM THE PRODUCTION OF POLYHYDRIC ORGANICS.
Dow Chemical Co., Freeport, Tex. Texas Div.
Copy available from GPO Sup Doc as EP1.16:12020 EEQ 10/71, $1.75; microfiche from NTIS, Springfield, Va 22161 as PB-213 841, $2.25. Environmental Protection Agency, Water Pollution Control Research Series, October 1971. 198 p, 56 fig, 31 tab, 19 ref, 5 append. EPA Project 12020 EEQ 10/71.

Descriptors: *Waste water treatment, *Pilot plants, *Brines, *Biological treatment, *Solvent extractions, Carbon, Adsorption, Membranes, *Activated sludge, Estimated costs, Organic compounds, Alkalinity, Salts, Design.
Identifiers: *Glycol, Waste water characterization, Treatability, Pilot plant operation, Cost estimates, Polyhydric organics, Chlorohydrin process.

The brine waste water resulting from the production of glycols, by the chlorohydrin process, is characterized by high salt content (8-10% NaCl) excess alkalinity, and the presence of several organic compounds. Solvent extraction of the glycol waste water with amines produces a raffinate that is salt-saturated and a product enriched in glycol. The required large solvent-to-feed ratio and operation at near freezing temperatures make the process uneconomical. Adsorption of glycols on activated carbon was found unfeasible because of the low capacity of carbon for the glycols. Cellulose acetate membranes with low salt rejection were unable to significantly separate the salt and glycol. Activated sludge pilot plant was successfully operated for the treatment of an equalized glycol waste water. Removal of over 90% of the TOD at a retention time of 8.0 hours and loadings of 2.0 to 3.0 lbs. TOD/lb. MLVSS/day were obtained. Design parameters determined from pilot plant operation were used to design a 6 MGD treatment plant, at an estimated cost of 3.3 cents per pound of TOD removed or less than 0.2 cents per pound of propylene glycol produced. (EPA)

Descriptors: Phosphorus, *Activated sludge, *Waste water treatment, *Biological treatment, *Wisconsin, Treatment facilities.
Identifiers: *Phosphorous removal.

The overall total phosphorus removal in conventional activated sludge treatment plants at Jones Island, Milwaukee, Wisconsin, averages 80% as opposed to less than 50% in the majority of the activated sludge plants elsewhere in this country. A detailed plant-scale evaluation of the activated sludge process parameters was made over a period of three years to obtain optimum values for phosphorus removal. The total phosphorus removal generally followed the variations of the flow and BOD of the plant influent and was not dependent on the clarifier sludge blanket-depths. The BOD and the total phosphorus loading rate on the microorganisms and the MLSS concentrations were found to be of some significance in the removal of phosphorus. Total phosphorus removal was directly related to the solids (Milorganite) production. A significant portion of the phosphorus is insolubulized in the waste water before it reaches the plant. It is proposed that this is a probable cause for the higher total phosphorus removals obtained. It appears that brewery waste water aids soluble phosphorus removal at the Milwaukee plants. Limited studies with waste pickle liquor addition to the ML indicated that consistently higher soluble phosphorus removals can be obtained without any apparent detrimental effect on the process or equipment. (EPA)

PHOSPHORUS REMOVAL AND DISPOSAL FROM MUNICIPAL WASTE WATER.
Texas Univ., Galveston. Medical Branch.
Copy available from GPO Sup Doc as EP1.16:17010 DYB 02/71, $1.25; microfiche from NTIS, Springfield, Va 22161 as PB-218 415, $2.25. Environmental Protection Agency, Water Pollution Control Research Series, February 1971. 121 p, 18 fig, 13 tab, 40 ref. EPA Project 17010 DYB 02/71, Grant WPD 223-01-68.

Descriptors: Phosphorus, Salts, Absorption, *Waste water treatment, Municipal wastes, Waste disposal, *Texas, *Activated sludge, *Biological treatment, Operating costs, Treatment facilities.
Identifiers: *Phosphorus removal, Lime addition, Hydraulic overload, Sludge production, Metallic salts, Digester supernatant, *Iron salts, Aluminum salts.

Phosphorus removal was implemented at the full-scale, 1 mgd, Texas City, Texas Activated Sludge Plant. Over a two-year period, several techniques were investigated. Control of the plant operations to enhance biological removal of phosphorus was not a reproducible process. The most efficient means of controlling phosphorus was by the use of iron salts added to the raw waste water or primary effluent. Aluminum salts were slightly less effective. All aspects of plant operation were investigated, such as excess sludge production and drainability of digested sludge. Estimates of the operating costs associated with phosphorus removal are presented. (Barth-EPA)

A COMPUTER MODEL FOR EVALUATING COMMUNITY PHOSPHORUS REMOVAL STRATEGIES,
JBF Scientific Corp., Burlington, Mass.
D. S. Yeaple, D. A. Barnes, and F. A. DiGiano.
Environmental Protection Agency Report EPA 400/9-73/001, October 1973. 304 p, 25 fig, 14 tab, 60 ref. EPA Contract 68-01-0758.

Descriptors: Phosphorus, *Water pollution treatment, *Evaluation, *Costs, Local governments, *Computer models, Detergents, *Waste water treatment.
Identifiers: *Phosphorus removal strategies, Chemical treatment.

A computer model for evaluating a number of strategies for removing phosphorus in wastewater has been developed. The influence on total treatment cost of several non-treatment strategies such as the elimination of phosphates is detergents can be evaluated in terms of the treatment cost at local waste treatment plants. A review of phosphorus removal technology was conducted in order to determine what methods should be included as available techniques in a treatment strategy. Chemical precipitation techniques were selected as being both available and most effective at the present time and in the immediate future. The model reports to the user the total cost of a selected strategy for removing phosphorus. Over 21 treatment schemes with several sludge handling schemes can be selected and evaluated depending on local conditions. The computer guides the user through a series of questions and answers to develop a local profile and prediction of future conditions. (EPA)

DISPOSAL OF SOLID RADIOACTIVE WASTES IN BEDDED SALT DEPOSITS.
National Academy of Sciences. National Research Council, Washington, D.C. Committee on Radioactive Waste Management.
Available from Superintendent of Documents, U.S. Government Printing Office, Washington, D.C., $0.35/copy. November 1970. 28 p, 7 ref, append.

Descriptors: *Radioactive waste disposal, *Nuclear wastes, *Waste storage, *Mining, *Underground, Sodium chloride, Rock mechanics, Aquifers, Hydrology, Heat transfer, Plutonium, *Kansas.
Identifiers: *Salt mine, Lyons(KS).

To assist in the evaluation of AEC plans, the Committee on Radioactive Waste Management convened a Panel on Disposal in Salt Mines. Based on the recommendations of the panel, the Committee reached the following conclusions: (1) The use of bedded salt for the disposal of radioactive wastes is satisfactory. In addition, it is the safest choice now available, provided the wastes are in an appropriate form and the salt beds meet the necessary design and geological criteria. (2) The site near Lyons, Kansas, selected by the AEC is satisfactory, subject to the development of certain additional confirmatory data and evaluation. Initial disposal will be for low level solid waste material contaminated with plutonium and other long-lived transuranium nuclides. Subsequent disposal will include highly radioactive, high temperature, solidified wastes. (Houser-ORNL)

DEEP SELF-BURIAL OF RADIOACTIVE WASTES BY ROCK-MELTING CAPSULES,
New Mexico Univ., Albuquerque. Dept. of Chemical and Nuclear Engineering.
S. E. Logan.
Nuclear Technology, Vol 21, p 111-124, February 1974. 13 fig, 7 tab, 16 ref.

Descriptors: *Radioactive waste disposal, Geology, *Rocks, *Granites, *Basalts, *Rock properties, *Rock mechanics, Heat, Thermal radiation, Ablation, Cooling, Strontium, Cesium, Assessment, Safety, Evaluation, Model studies.
Identifiers: High-level waste, Descent data.

The rock-melting-capsule concept utilizes decay heat from high-level radioactive wastes in a container to melt rock. Descent by gravity achieves deep disposal. Molten rock resolidifies in the wake of the capsule, providing permanent isolation from the environment. Results calculated for: (1) waste categories of fission products, actinides, and Sr + Cs; (2) spherical capsule radii of 25, 50, and 100 cm; (3) waste oxide volume fractions of 0.15, 0.30, and 0.50; (4) basalt and granite rock types -- indicate adequate heat generation for rock melting, maximum depth increases with capsule size and waste concentration, with depths greater than 10 km obtainable by each waste category. Further work is recommended to investigate corrosion and erosion of refractory container materials in contact with waste oxide melts and molten rock. (Houser-ORNL)

OBSERVATIONS ON MANGANESE IN GEORGIA WATERS,
Georgia Inst. of Tech., Atlanta. School of Applied Biology.
R. S. Ingols, and R. D. Wilroy.
Journal American Water Works Association, Vol 54, No 2, p 203-207, February, 1962. 12 ref.

Descriptors: *Manganese, *Water quality control, *Stratification, Destratification, Sedimentation, Oxidation, *Georgia, *Water treatment.
Identifiers: Chattahoochee River(GA), Lake Lanier(GA).

Manganese is frequently present in springs and in the bottoms of reservoirs. The water plant operator should determine the layer in which manganese is present and set the intake level to obtain water from the layer containing the lowest concentration. When however, the operator can do nothing to prevent the presence of manganese in the raw-water supply, it becomes necessary to oxidize the manganese to insoluble manganic hydroxide; this must be done before filtration, because after manganese passes through the filter, it can precipitate out in the clear well or pass on into the mains. The water utility with a small water supply reservoir could control manganese in the hypolimnion with an air jet to prevent stratification and introduce dissolved oxygen. If the reservoir is kept continuously agitated, dissolved oxygen deficiences cannot develop and the mineral manganese on rocks or in the mud at the pool bottom should remain insoluble. Artificial turnover would be the best way of attaining the highest quality of water available for potable purposes, at least as far as manganese and hardness are concerned. (Jernigan-Vanderbilt)

Army Engineer Institute for Water Resources Contract Report 74-3, February 1974. 185 p, append. Army Contract DACW31-61-C-0057.

Descriptors: *Conjunctive use, *New York, *Cost-benefit analysis, *Water supply, *Municipal water, Water quality, *Water treatment, Computer programs, *Humid areas.
Identifiers: *Elmira(NY).

The role that groundwater should be accorded in future allocations of surface water storage for water supply is reviewed; the discussion is directed toward identifying circumstances under which integrated use of groundwater and surface water sources is economically and hydrologically desirable in humid areas like the Appalachian Region of the Eastern United States. For a case study, the Elmira, New York, water supply region

was selected. On the basis of the data collected at Elmira, the alternative of mixing conventionally treated Chemung River water with untreated groundwater in a proportion to yield a product of acceptable hardness, and followed by chlorination of the mixed water, would result in the least-cost water supply. The economically poor showing of the integrated reservoir-aquifer source combination was largely due to present regulations requiring full-scale treatment of all surface water supplies regardless of the degree of purity of the water source. Research related to the quality of irrigation return flow is being conducted at numerous institutions throughout the western United States. Related work is also underway at other institutions in the United States, as well as other portions of the world. Approximately 100 sources of material have been searched for articles pertinent to the National Irrigation Return Flow Research and Development Program. These articles describe water quality problems resulting from irrigated agriculture, potential technological solutions for controlling return flows, recent research pertinent to return flow investigations, and literature associated with institutional constraints in irrigation return flow quality control. This bibliography contains 820 abstracts. This third annual issue of SELECTED IRRIGATION RETURN FLOW QUALITY ABSTRACTS covers publications printed in 1972 and 1973. (EPA)

NUCLEAR POWER AND PUBLIC OPINION,
Portland General Electric Co., Oreg.
R. L. Katren.
Health Physics, Vol 26, No 6, p 483-488, June 1974. 2 fig, 2 tab, 5 ref.

Descriptors: *Nuclear powerplants, *Phychological aspects, *Surveys, *Radioactivity effects, Environment, Environmental effects, Ecology, Aquatic life, Water pollution, Columbia River, Public health, Benefits, Training, Area redevelopment, Safety, Waste disposal, *Oregon, Attitudes.
Identifiers: *Public opinion, *Attitude survey.

A public opinion survey initiated in Oregon prior to construction of the first privately owned commercial nuclear plant in the region showed that approximately half of the population favored the plant. Initially, about one-third of the public had no opinion, with about one in five expressing negative views. Both indecision and negative views decreased as plans for and construction progressed. Women and those with no college tended to be more indecisive in their views. In general, opposition to the reactor was based on nuclear or radiological safety concerns. In particular, concern was sizeable in the area of agriculture, aquatic ecology, and water pollution. Evaluation of the opinions of various subgroups as well as other public opinion studies suggests how the health physicist can most effectively fulfill his role as an educator and public resource person. A MULTIDISCIPLINARY POLICY DECISION MODEL FOR WATER POLLUTION,
Newcastle Univ. (Australia).
J. M. Dixon.
In: Proceedings of the Urban Water Economics Symposium, April 28, 1973, University of Newcastle, New South Wales, University of Newcastle Research Associates, Ltd, C. Aislabie, editor, p 49-60, 1973. 3 fig, 7 ref.

Descriptors: *Mathematical models, *Decision making, *Watershed management, *Economics, Dissolved oxygen, Pricing, River flow, Estuaries, Water quality, Pollution taxes, Water quality standards, Pollution abatement, Water pollution control, Australia.
Identifiers: Pareto optimum, Pigouvian solutions.

Because of the traditional reliance on administratively imposed standards, pigouvian solutions, i.e. taxation measures which cause the public and private marginal cost and marginal benefit functions to coincide, have been sought for many environmental problems. In this light a mathematical model was constructed for the Bremer estuarine reach in southeast Queensland. Effluent discharge along this reach includes two sewage outlets, two abattoirs, a hardboard mill and a sawmill. Dissolved oxygen was used as the water quality parameter, and effluent charges were taxed to the different dischargers. The computer model comprised two submodels, one economic, simulating the response of the effluent dischargers to tax imposition, and one physical, predicting the dissolved oxygen concentration along the reach for any given set of discharges. Advection and one dimensional eddy diffusion were used to model the tidal characteristics, and temperature and flow data available from 1969 modeled and riverflow conditions. Results from a variety of computer runs illustrated stream conditions for different taxation procedures. The option of effluent treatment was included in the model with a treatment cost estimating subroutine. The methodology described is a viable method for policy formulation and is generally applicable. Sensitivity analyses can further aid in determining which water quality parameters should be assigned highest priorities. (See also W74-11682) (LaPointe-North Carolina)

CONTROL AND CONFINEMENT OF OIL POLLUTION ON WATER WITH MONOMOLECULAR SURFACE FILMS,
Naval Research Lab., Washington, D.C. Ocean Sciences Div.
W. D. Garrett, and W. R. Barger.
Available from NTIS, Springfield, Va. 22161 as AD-744 943 Price $3.50 printed copy; $2.25 microfiche. Memorandum Report 2451, June 1972. 58 p, 10 fig, 4 tab, 13 ref, 4 append. USCG 724110.1/4-1.

Descriptors: *Oil spills, *Water pollution control, Oily water, *Monomolecular films, Surfactants, *Oil pollution, *Pollution abatement.
Identifiers: *Oil spill cleanup.

Materials with which to form single-molecule-thick films that are capable of reducing the area covered by oil spilled on water were tested. These chemicals are able to maintain the oil in a layer up to a maximum of approximately one-half inch thick by preventing it from spreading over the water surface. If the oil has spread before adding the chemical, the monomolecular film pushes the oil back into a thicker layer. Such materials, classified as Collecting Agents by the National Contingency Plan, may be quite useful in increasing the efficiency of oil recovery devices, since all such devices perform better on thicker layers of oil. All materials investigated are commercially available in large quantities. Properties examined in this investigation included (1) freezing points, (2) viscosities, (3) specific gravities, (4) maximum film pressures achievable by the single-molecule-thick film, (5) relative durabilities of materials in monomolecular layers confining oil on water in motion, and (6) film pressures as a function of surface concentration of the monolayer forming materials. EVALUATION OF IRRIGATION SCHEDULING FOR SALINITY CONTROL IN GRAND VALLEY,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
G. V. Skogerboe, W. R. Walker, J. H. Taylor, and R. S. Bennett.
Copy available from GPO Sup Doc as EP1.23:660/2-74-052, $1.30; microfiche from NTIS, Springfield, Va 22161 as PB-235 633, $2.25. Environmental Protection Agency, Technology Series Report EPA-660/2-74-052, June 1974. EPA Program Element 1BB039. S-800278.

Descriptors: Colorado River, *Deep percolation, Irrigation, Irrigation effects, *Irrigation efficiency, Irrigation water, *Return flow, Saline soils, Saline water, Salinity, Water distribution(Applied), Water loss, Water pollution sources, Water quality, *Colorado.
Identifiers: *Grand Valley(CO), Irrigation scheduling, *Salinity control.

Although the results of this study indicate that existing programs for irrigation scheduling in the Grand Valley to control salinity are having only a marginal effect, the potential for 'scientific' irrigation scheduling has been well established. Also, irrigation scheduling should not be taken individually as a salinity control measure because its effectiveness is not exclusive of the operation of the total irrigation system. Thus, irrigation scheduling is a necessary, but not sufficient, tool for achieving improved irrigation efficiencies. The real strides in reducing the salt pickup resulting from over-irrigation will comefrom the employment of scientific irrigation scheduling in conjunction with improved on-farm irrigation practices. This combined effect could result in a reduction of 300,000 tons annually of salt pickup from the Grand Valley, depending upon the degree of improvement in present on-farm irrigation practices. (EPA)
W74-11929

ECONOMIC DAMAGES TO HOUSEHOLD ITEMS FROM WATER SUPPLY USE,
Environmental Protection Agency, Washington, D.C. Office of Research and Development.
D. P. Tihansky.
Copy Available from GPO Sup Doc as EP1.23:600/5-73-001, $1.30; microfiche from NTIS, Springfield, Va 22161 as PB-237 716, PC$3.00/$2.25 MF. Environmental Protection Agency, Socioeconomic Studies Series Report EPA-600/5-73-001, July 1973. 86 p, 7 fig, 10 tab, 50 ref. Program Element 1H1094.

Descriptors: *Domestic water, *Water quality, *Economic impact, *Damages, Estimated benefits, Engineers estimates, Computer models, Annual benefits, Water supply, Water utilization, Model studies, Costs, Computer programs.

Household appliances and personal items in contact with water supply are subject to physical damages from chemical and other constituents of the water. This study translates these damages into economic losses for a typical household. Then it aggregates these losses at the national and individual state levels. To do so requires several stages of analysis. First, the types of physical damages expected and associated water quality determinants are identified. The physical effects are next translated into economic losses. Second, damage functions are formulated to predict likely impacts of water quality changes on each household unit affected. Third, a computer program based on these functions is designed to estimate total damages per typical household and to aggregate them over selected regions. Finally, the program is applied to state-to-state data on water supply sources and socioeconomic descriptors. Total damages to U.S. residents in 1970 are estimated in the range, $0.65-$3.45 billion, with a mean of $1.75 billion. The mean translates into $8.60 per person. States contributing most to total damages are California ($230 million) and Illinois ($164 million). On a per capita basis Arizona ($22.53) and New Mexico ($18.58) rank highest, whereas South Carolina ($1.15) and Oregon ($1.73) are at the other end of the spectrum. When per capita damages are compared by source of water supply, those from private wells are worst at an average of $12.34, treated groundwater next at $11.20, and treated surface water sources at only $5.83. PROJECTIONS OF RADIOACTIVE WASTES TO BE GENERATED BY THE U.S. NUCLEAR POWER INDUSTRY,
Oak Ridge National Lab., Tenn.
J. O. Blomeke, C. W. Kee, and J. P. Nichols.
Available from NTIS, Springfield, Va. 22161 as Rept. No ORNL-TM-3965; $5.45/copy, $2.25/microfiche. Report No ORNL-TM-3965, February 1974. 116 p, 3 fig, 76 tab, 26 ref, 2 append.

Descriptors: *Radioactive waste disposal, *Projections, *Forecasting, Evaluation, Nuclear powerplants, Effluents, Design criteria, Research and development, Research facilities, Planning, Fuels, Iodine, Plutonium, Waste storage, Radioisotopes.
Identifiers: *Waste management, *Fuel reprocessing, Fuel cycle.

Projections of the industrial radioactive wastes from the nuclear cycle are useful in the planning and design of methods and facilities that will be needed for their future management, and for the assessment of potential environmental effects. With greater emphasis currently being given to the development of nuclear energy resources, including the development and demonstration of the most practicable methods of managing the radioactive wastes therefrom, more current and comprehensive projections are required. The present study was made to fulfill this need. Ten types of radioactive wastes to be generated within the fuel cycle operations of the U.S. nuclear power industry are defined, and projections are presented of their annual generation rates, shipping requirements, and accumulated characteristics over the remainder of this century. The power complex is assumed to consist of uranium- and plutonium-fueled LWRs, HTGRs and LMFBRs, and the installed nuclear electric capacity of the U.S. is taken as 134, 504, and 1200 GW at the ends of calendar years 1980, 1990, and 2000, respectively. BIODEGRADATION OF OIL IN SEA WATER FOR NAVAL POLLUTION CONTROL,
Naval Civil Engineering Lab., Port Hueneme, Calif.
T. B. O'Neill.
Available from NTIS, Springfield, Va 22161 as AD-763 342, Price $3.00 printed copy; $2.25 microfiche. Annual Report No 3, April 1973. 12 p, 7 tab, append. ONR Contract NR306-883.

Descriptors: *Biodegradation, *Oil spills, *Water pollution treatment, Aquatic bacteria, Water pollution control, Aquatic microorganisms.

Microorganisms that possess the ability to oxidize hydrocarbons were studied. Over a hundred different hydrocarbonoclastic organisms have been secured either from local marine coasts or from collections. These cultures include molds and yeasts as well as bacteria. The cultures are readily maintained on conventional media. The maximum hydrocarbon loss in any single experiment involving a pure culture of bacteria was 11%. (Knapp-USGS)

6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

PLANNING AND ANALYSIS OF METROPOLITAN WATER RESOURCE SYSTEMS,
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.
E. A. McBean, and D. P. Loucks.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-235 257; $17.00 in paper copy, $2.25 in microfiche. Technical Report No 84, June 1974. 122 fig, 19 tab, 492 equ, 541 ref. OWRR W-146(3753)(1).

Descriptors: *Systems analysis, *Water resources development, *Mathematical models, *Optimum development plans, Economic efficiency, Design criteria, Management, Cost-benefit analysis, Decision making, Distribution systems, Waste water treatment, Flood control, Groundwater, Long-term planning, Regional analysis, Scheduling, Synthetic hydrology, *Reviews.
Identifiers: *Metropolitan areas.

Presented is a critical review and analysis of the application of management science and operations research techniques to the solution of metropolitan water resources planning and management problems. The review focuses specifically on the effects of hydrologic risk and economic, political and technologic uncertainty. The report is divided into chapters that discuss particular metropolitan water resources problems, e.g., flood damage, water supply, water quality, demand forecasting, etc. Alternative methodologies are introduced and applied to a variety of metropolitan water resources problems, illustrating their advantages and limitations for providing useful information for investment and operating decisions. This critical review is based on the state-of-the-art as reflected in over 500 documents (e.g., books, journals, technical reports) which report on the application of systems analysis, i.e., optimization techniques, decision theory, probability theory, simulation analysis, and stochastic processes, to the development and management of water resources in metropolitan areas. A number of example problems illustrates some of the theoretical principles and applications discussed. (Bell-Cornell)

A BAYESIAN APPROACH TO HYDROLOGIC TIME SERIES MODELING,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
G. J. Vicens, I. Rodriguez-Iturbe, and J. C. Schaake.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-235 256; $6.75 in paper copy, $2.25 in microfiche. Ralph M. Parsons Laboratory for Water Resources and Hydrodynamics, Report No 181, March, 1974. 286 p, 51 tab, 24 fig, 47 ref, 7 append. OWRTC-4118(9021)(4). NSF GK-41643x.

Descriptors: *Synthetic hydrology, *Regression analysis, *Risks, *Time series analysis, Stochastic processes, Model studies, Streamflow, Planning, Design criteria, *Regional analysis.
Identifiers: *Bayesian methods.

Most water resources designs are problems of decision-making under uncertainty. Simulation models and synthetic streamflow generation are two techniques presently used to assess the impact of these uncertainties. But only the natural uncertainties of the streamflows are accounted for. Informational uncertainties, both about the parameters and the models, due to relatively short historical records, are largely ignored. This work has two objectives. First, to develop a procedure that explicitly accounts for the parameter uncertainties in water resources planning; and second, to investigate the use of regional information in conjunction with the historical record to reduce the parameter uncertainties. To attain these goals, Bayesian procedures have been applied to the following hydrologic time series models of annual streamflows: (1) Independent Normal Process, (2) Independent Log-Normal Process, (3) First-Order Normal Autoregressive Process, and (4) First-Order Log-Normal Autoregressive Process. To obtain prior information, regression models and subjective judgements have been used to process the available regional information. A design example showed that the Bayesian procedure is superior to traditional procedures which ignore parameter uncertainties. In addition, various examples of combining regional information with the at-site historical record show that this approach reduces

the parameter uncertainties. These conclusions are especially true when the river of interest has high variance, serial correlation, and/or relatively short historical record.

A SELECTED ANNOTATED BIBLIOGRAPHY ON THE ANALYSIS OF WATER RESOURCE SYSTEMS, FIFTH VOLUME,
Office of Water Research and Technology, Washington, D.C.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-235 336, $8.50 in paper copy, $2.25 in microfiche. Water Resources Scientific Information Center, Report WRSIC 74-206, 405 p.

Descriptors: *Systems analysis, *Bibliographies, *Water resources, Optimization, Simulation analysis, Operations research, Abstracts, Mathematical models, Systems analysis, Water supply, Irrigation, Linear programming.

This is an annotated bibliography of 265 abstracts of selected publications issued in 1973 pertaining to the application of systems analysis techniques for defining and evaluating alternative solutions to water resource problems. The first two volumes of this bibliography, having the same title, were published by the Cornell University Water Resources and Marine Sciences Center, Ithaca, New York (Publication 25, August 1969; Publication 35, June 1971); the third and fourth volumes were published by the Water Resources Scientific Information Center in December 1972 and December 1973, respectively. Both subject the author indexes are provided. Descriptors are listed with each abstract. The abstracted material emphasizes the application of optimization and simulation techniques for assisting in the planning and management of water resource systems.
W74-11574

THE USE OF STATISTICAL DISTRIBUTIONS FOR DETERMINING THE MAGNITUDE AND FREQUENCY OF FLOODS,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
C. E. Beer, and R. L. Rossmiller.
In: Ames Reservoir Environmental Study. Appendix 4. Physical Relationship with the Agricultural Sector, Iowa State Univ. Report ISWRRI-60-A4, 1973, p 4-6-i--4-6-28. 4 fig, 7 tab, 10 ref.

Descriptors: *Flood forecasting, *Flood discharge, *Statistical methods, Iowa, Flood data, Flood frequency, Hydrograph analysis, Flood profiles, Mathematical studies, Flood recurrence interval, Frequency analysis.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA).

Alternative flood frequency distributions may be chosen to represent hydrologic conditions within watersheds through the use of sampling data. Such predicted hydrological data can be used to project optimum water management policies to deal with potential flooding conditions. Projections from each of the possible frequency distributions may vary significantly however, creating some uncertainty as to the optimal management plan. A number of frequency functions including the log normal, gamma, extreme value functions of type I-largest and type III-smallest, log Pearson type III and Weibull are considered. Each distribution is characterized by differing parametric values (e.g., scale factor, shape factor) which describe the population. Efforts by the Iowa Natural Resources Council to calculate low-frequency relationships are also documented. The variability of predicted flood discharges for Iowa's Skunk River utilizing log normal, log-Pearson and regional equations is illustrated. In general, variability increased with larger return periods, the log-normal distributions yielding the largest predicted value. The impact on skew coefficients and variability of outliers are also examined for 170 Iowa streams. When the low value (outlier) was excluded the coefficient of skew increased positively and variability between distribution declined. (See also W74-11605) (Schroeder-Wisconsin)
W74-11611

MATHEMATICAL SIMULATION OF STREAM WATER QUALITY AT AMES,
Iowa State Univ., Ames. Dept. of Civil Engineering.
P. Pins, and M. D. Dougal.
In: Ames Reservoir Environmental Study. Appendix 5. Physical Relationship with the Urban Sector, Iowa State Univ. Report ISWRRI-60-A5, 1973, p 5-5-i--5-5-135. 18 fig, 19 tab, 19 ref, addendum.

Descriptors: *Mathematical models, *Cities, *Water quality, Iowa, Forecasting, Population, Rivers, Reservoirs, Effluents, Water pollution control, Biochemical oxygen demand, Algae, Reaeration, Waste water(Pollution), Flow, Waste water treatment, Dissolved oxygen, Low flow frequency.
Identifiers: *Ames(IA), *Skunk River(IA).

The Iowa State University's water quality model was designed to estimate the relationship between stream quality and selected stream and effluent parameters of the Skunk River at Ames, Iowa by providing spatially defined diurnal variations. Control of variables and data requirements for the model include estimates of population growth, and variations in water and waste water levels, flows, and qualities. Water quality variables evaluated by the model include chemical composition, stream flow, and dissolved oxygen levels, each depicted spatially. It is also used to predict requisite changes in Ames' treatment plant effluent parameters over time to satisfy existing state and federal water quality requirements. For 1970 conditions, and ordinary secondary treatment methods, the existing water quality standards would be violated during late summer, fall, or winter at low flow conditions at or more severe than the once-in-two-year frequency events. For 1995 projected conditions, utilizing low or medium population estimates, warm water aquatic environment stream standards can only be met with advanced treatment at Ames. Trade off levels between three constituents affecting DO levels are provided through the model. A brief compendium of other ISU studies broadening the understanding of relationships within the stream environment is provided. (See also W74-11614) (Schroeder-Wisconsin)

TOWARDS A MODEL FOR PREDICTION OF RESIDENTIAL WATER USE,
Hunter Valley Research Foundation, Tighes Hill (Australia).
G. McCalden.
In: Proceedings of the Urban Water Economics Symposium, April 28, 1973. University of Newcastle, New South Wales. University of Newcastle Research Associates Ltd., C. Aislabie, editor, p 99-111, 1973. 9 ref.

Descriptors: *Mathematical models, *Water users, *Water demand, *Regression analysis, *Water consumption, Statistical methods, Statistical models, Distribution systems, Population, Weather, Climates, Income, Age, Swimming pools, Monitoring.
Identifiers: Household metering, Residential use.

This proposed model for determining future residential water use consists of 4 major sets of determinants: (1) population characteristics in the area served; (2) use characteristics of the population subgroups; (3) variations in weather and climate; and (4) characteristics of the supply and distribution systems and its sociopolitical milieu. Previous work has simply defined a per capita consumption coefficient, but a superior model is possible by breaking the population into different subgroups each with its own consumption coefficient. Population subgroups could be defined according to age, income. or lifestyle. Similarly, a distinction should be made, and included in the model, between individuals as water users, and as owners of water using adjuncts like washing machines, swimming pools, or gardens. Weather and climate should be broken down into random, seasonally determined, and locationally determined characteristics. The major difficulty in the model would be the determination of the various use coefficients. Multiple regression analysis is suggested to first determine coefficients for population age groups, and household characteristics. Households could be metered at different intervals (2 or 3 months for seasonal data) for at least a year to provide the necessary data. The determinants so calculated would provide a firmer basis for pricing policy, for planning user education programs, and for formulation of controls. (See also W74-11682) (LaPointe-North Carolina)

MODELS FOR ALLOCATION OF WATER RESOURCES,
Commonwealth Scientific and Industrial Research Organization, Melbourne (Australia). Div. of Building Research.
R. Sharpe.
In: Proceedings of the Urban Water Economics Symposium, April 28, 1973. University of Newcastle, New South Wales, University of Newcastle Research Associates Ltd., C. Aislabie, editor, p 171-176, 1973. 6 ref.

Descriptors: *Computer models, Water resource development, *Planning, Management, *Systems analysis, *Benefit cost analysis, Constraints, Land use, *Water allocation, Water supply develop-

ment, Domestic use, Sewage disposal, Drainage systems, Optimum development plans, *Australia.
Identifiers: Melbourne(Aust).

TOPAZ (Technique for the Optimum Placement of Activities into Zones) is a hierarchical planning model that incorporates engineering and economic planning at various levels from national to building layouts. The model was constructed to allow key decisions to be transformed to lower level constraints. Interactions between levels are quantified and upwards feedback can refine decisions. National level activities include apportionment of population, industry, capital, agriculture and commerce. Regional and urban levels further allocate these apportionments in addition to managing natural resources, recreation, and conservation. Thorough planning of water resources and their myriad uses requires a multi-level methodology such as the TOPAZ model; however the particular role of water in different problems necessitates individual solutions. Melbourne is currently engaged in a long range planning study to the year 2000. The criterion used is to maximize benefits less costs. Whereas current data are crude, submodels are proposed for each service, a sewerage submodel having already been developed. Submodels can be used separately or independently in the TOPAZ scheme. A specialized TOPAZ model of the siting of dams, hydro-power plants, rural and urban areas has been formulated which maximizes benefits less costs. Another specialized model allocates various land uses including forestry, agriculture, mining, national parks, and water storage within a water catchment area. These models allow interested parties an opportunity to determine objectives and constraints. (See also W74-11682) (LaPointe-North Carolina)

TOCKS ISLAND LAKE PROJECT,
Tippetts-Abbett-McCarthy-Stratton, New York.
G. T. McCarthy.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 100, No EE4, Proceedings Paper 10718, p 803-805, August 1974. 1 ref, append.

Descriptors: *Delaware River, *River basins, *Water supply, *Systems analysis, River basin development, Water sources, Inter-basin transfers, Dams, Hydrology, Delaware River Basin Commission, Water requirements, Water storage, Water supply development, Droughts, Low flow, Hydrologic budget, Simulation analysis, Hydrologic systems, Water demand, Environmental engineering, Tidal streams, Diversion, Saline water intrusion.
Identifiers: *Tock's Island Dam(Delaware River Basin).

The consequences of not constructing Tocks Island Reservoir from the standpoint of water supply was examined based on the results of a computerized system analysis of the basin. The analysis considered a recurrence of the 1960's drought, legal flow constraints, estimated 1986 and 2020 consumptive water use including power requirements and out-of-basin diversions to New Jersey, storage reservoirs included in the Basin Comprehensive Plan, and restraints on consumptive use when flow to the estuary was less than the estimated 3,000 cfs needed to contain the salt wedge below the Philadelphia water supply intake at Torresdale. Results of the study using 1986 demands indicated a minimun flow below Trenton with all planned reservoirs of 3,450 cfs; with all reservoirs except Tocks Island, 2,410 cfs; and less than 1,750 cfs with no new reservoir. Both the latter flows represent unsafe conditions considering the salt wedge. Based on demands in 2020, conditions would be worse. (Humphreys-ISWS)

GEOLOGIC IMPLICATIONS,
Iowa State Univ., Ames. Dept. of Earth Science.
L. V. A. Sendlein.
In: Ames Reservoir Environmental Study, Appendix 1 - Vol 2. Natural and Archaeological Resources of the Reservoir Site and Stream System, Iowa State Univ. Report ISWRRI-60-A1-Vol 2, 1973, p 1-2-i--1-2-21, 6 fig, 2 tab, 5 ref.

Descriptors: *Reservoir sites, *Iowa, Geologic formations, Reservoirs, Geology, Geologic investigations, Geologic mapping Hydrogeology, Future planning(Projected), Quarries, Limestones, Gravels, Land resources.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA).

The geology and geohydrology in the Skunk River Valley, site of the Ames Reservoir, are described. The stratigraphy indicates that the St. Louis formation (Mississippian) outcrops in bluff walls on the right abutment and in quarries just south and north of the axis of the dam. A yellow sandstone also outcrops in the west abutment of the dam. Structural maps provided indicate that a series of small faults extend northeast-southeast. The axis of the dam lies directly on a small fault on steep flexure. Boreholes also substantiate that the bedrock valley has its thalweg 800 feet below sea level and 60 feet below the bedrock evaluation beneath the proposed axis of the dam. Surficial material of the flood plain is composed of a thin layer of 0-5 feet of organic silt. This material is underlain of intermixed sand and gravel to bedrock. South of the dam axis the bedrock is exposed at the surface in the valley wall and in limestone quarries. Under the proposed reservoir design most sand and gravel deposits will be lost due to flooding. Land containing limestone, while not flooded may be limited due to increased demand for recreational land. Impacts on groundwater levels are also evaluated. (See also W74-11579) (Schroeder-Wisconsin)

LIMNOLOGICAL AND FISHERIES ASPECTS OF THE RIVER AND THE PROPOSED RESERVOIR,
Iowa State Univ., Ames. Dept. of Zoology and Entomology.
R. W. Bachman, and C. L. Olson.
In: Ames Reservoir Environmental Study. Appendix 1 - Vol 2. Natural and Archaeological Resources of the Reservoir Site and Stream System, Iowa State Univ. Report ISWRRI-60-A1-Vol 2, 1973, p 1-4-i--1-4-80, 8 fig, 10 tab, 32 ref.

Descriptors: *Fisheries, *Limnology, *Rivers, *Reservoirs, *Environmental effects, Physical properties, Chemical properties, Iowa, Anadromous fish, Rough fish, Fish populations, Preimpoundment, Postimpoundment, Tailwater, Recreation.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA).

Benefits from improved sports fisheries of the proposed Ames Reservoir in Iowa depend primarily upon the reservoir's impact on the biological, physical, and chemical environment. Limnological studies of the Skunk River indicate that the geological change from that of rock and gravel near the impoundment to shifting sand below significantly affect the present fish population. Two recent surveys show a more diverse fish population existing above the geologic change with 35-36 species reported. Studies of the impact of the reservoir on stream characteristics including turbidity, DO, thermal stratification, and water quality indicate that the combination of nutrient levels in the river and the relatively long turnover rate of the reservoir mean that the impoundment will be a fertile body of water. Stream fish including smallmouth bass will be eliminated to be replaced by a characteristically large population of rough fish and varying levels of game fish depending on management practices. The poor quality of the river below the reservoir combined with the variable quality of the outflow precludes establishment of a substantial tailwater fishery. (See also W74-11579) (Schroeder-Wisconsin)
W74-11582

SOME ESTIMATED IMPACTS OF THE PROPOSED AMES RESERVOIR UPON WILDLIFE,
Iowa State Univ., Ames. Dept. of Zoology and Entomology.
M. K. Petersen.
In: Ames Reservoir Environmental Study. Appendix 1 - Vol 2. Natural and Archaelogical Resources of the Reservoir Site and Stream System, Iowa State Univ. Report ISWRRI-60-Al-Vol 2, 1973. 1-5-1--1-5-54. 9 tab, 32 ref.

Descriptors: *Reservoirs, *Wildlife habitats, *Environmental effects, Postimpoundment, Preimpoundment, Iowa, Birds, Mammals, Wildlife, Decision making, Economic impact.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA).

Impacts of Iowa's proposed Ames Reservoir upon the region's wildlife was surveyed. During two months in 1972, 15 four-man teams were assigned specific habitats within the adjoining area, ranging from 0.3-40 acres. Team activities included interviewing local landowners, cover mapping, habitat analysis and evaluation, and wildlife population census. Landowners generally opposed the reservoir construction with monetary and emotional attachments most often cited as reasons. The landowners supporting the impoundment noted economic gains. A summary of wildlife population density and habitat quality data derived from the survey indicates that the entire proposed reservoir site is composed of only fair wildlife habitats and less than fair population densities of most species. Possible distortions of these values are noted, however. Wildlife management recommendations are that the reservoir land immediately surrounding the impoundment should be purchased and intensively managed for wildlife and erosion control. Development adjacent to the reservoir should also be minimized. Estimates of total economic losses associated with wildlife ($174,292) indicate that more benefits will accrue from the reservoir than losses. (See also W74-11579) (Schroeder-Wisconsin)

AMES RESERVOIR ENVIRONMENTAL STUDY. APPENDIX 2. ECONOMIC AND SOCIAL IMPACT,
Iowa State Water Resources Research Inst., Ames.

Available from the National Technical Information Service, Springfield, Va. 22161 as PB-235 401, $19.00 in paper copy, $2.25 in microfiche. Report ISWRRI-60-A2 (IURR-FRS-9-A2), 1973. 319 p, 6 fig, 20 tab, 67 ref. OWRT A-999-IA (8b).

Descriptors: *Reservoir construction, *Cost benefit theory, *Project planning, *Decision making, *Multiple-purpose projects, *Iowa, Social adjustment, Reservoir design, Indirect costs, Benefits, Social aspects, US Water Resources Council, Standards, Regional development, Water policy, Indicators, Direct costs, Value engineering, Systems analysis, Social participation, Input-output analysis, Water resources development, Wildlife, Water utilization, Flood damage, Recreation, Regional economics, Planning, Legislation, Government finance, Highway relocation, Land use, Land development, Property values, Evaluation.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA).

Social and economic impacts of Iowa's Ames Reservoir are discussed in three parts. In Part I, a number of economic issues are considered. Chapter 2 reviews the state-of-the-art and emerging government directives related to project evaluation. Chapter 3 addresses itself to the identification of relevant impacts. A proposed methodology traces the relationship of alternative reservoir designs to relevant impacts and discusses appropriate display methods to aid public participation in decision making. Chapter 5 discusses potential values to be associated with the direct economic impact of the proposed Ames Reservoir including flood control, recreation, increased water supply and improved water quality. A gross method to determine 'stemming-from' and 'induced-by' indirect benefits caused by changes within the agricultural sector is developed. 'Stemming-from' benefits were estimated at approximately $80,000/year under several project designs. Parts II and III center on the social impacts of the project. Impacts evaluated include changes in highway use and construction, local tax bases, residential disruption and displacement, and future housing development adjacent to the site. Compensation payments could exceed $7 million. A survey of 390 residents indicated that one-fourth favored the project, three-tenths opposed it, and one-fourth of the respondents dis not even know that it was being contemplated. EVALUATION OF WATER RESOURCES DEVELOPMENT PROJECTS: THE STATE-OF-THE-ART AND EMERGING DIRECTIVES,
Wisconsin Univ., Madison. Dept. of Agricultural Economics.
D. Bromley.
In: Ames Reservoir Environmental Study. Appendix 2. Economic and Social Impact, Iowa State Univ., Ames, Report ISWRRI-60-A2 (IURR-FRS-9-A2) 1973, p 2-2-1--2-2-23. 9 ref.

Descriptors: *Evaluation, *Federal project policy, *Project planning, Technology, Multiple-purpose projects, Legislation, Economic justification, Regional development, Flood plains, Welfare(Economics), Social participation, Cost-benefit theory.
Identifiers: *Ames Reservoir(IA).

The historical development of governmental guidelines covering economic evaluation of water resources projects is outlined. Included in the historical perspective are the 1936 Flood Control Act, the 1950 interagency 'Proposed Practices for Economic Analysis of River Basin Projects '(Green Book), the Bureau of Budget's Circular A-47 and Senate Document 97. Since 1969, a special task force of the Water Resources Council, reacting in part to presidential and congressional pressures, published 'Procedures for Evaluation of Water and Related Land Resources Projects' which suggested project benefits accounting be computed under four accounts--national economic development, regional development, environmental quality, and social well-being. The report has become the subject of various criticisms including the potential double accounting within the accounts, and the relatively low proposed discount rates (7%), leading, in part, to the dropping of the social well-being objective. Of equal significance in the changing federal policy with respect to project benefit analysis is a recently published compendium of 290 recommendations proposed by the Water Resources Council. To illustrate, a brief discussion of the impacts of selected Council recommendations on Iowa's proposed Ames Reservoir project's benefits is presented. (See also W74-11586) (Schroeder-Wisconsin)

ALTERNATIVE TAXONOMICAL CONSTRUCTS,
Iowa Univ., Iowa City. Inst. of Urban and Regional Research.
J. S. Drake.
In: Ames Reservoir Environmental Study. Appendix 2. Economic and Social Impact, Iowa State Univ., Ames, Report ISWRRI-60-A2 (IURR-FRS-9-A2), 1973, p 2-3-1--2-3-42.

Descriptors: *Evaluation, *Welfare(Economics), *Social participation, Decision making, Cost-benefit theory, Reservoirs, Project planning, Methodology, Value engineering, Direct costs, Indirect costs, Economic impact, Comprehensive planning, Systems analysis, Water resources development, Intangible benefits.
Identifiers: *Ames Reservoir(IA), *Project impact analysis, Skunk River Basin(IA), Environmental impact.

Growing interdisciplinary planning in public works projects requires a clearly understandable taxonomy of the potential impacts among participants. Such a taxonomy may be constructed either in reference to impact-mechanisms or impact-incidences. The first distinguishes between impacts according as to how the impact was generated and is useful in technical analysis. The second differentiates impacts according to their incidents and may be useful in participatory evaluation processes. Several paradigms for mechanism based impact classifications including the conventional impact classification found in water resources projects (primarily preoccupied with an economic perspective) and the system analysis paradigm approach which has sought greater emphasis on the identification and measuring of impacts rather than weighting them, are discussed. Elements of each paradigm are synthesized into a proposed mechanism-based impact paradigm which might be utilized in evaluating a complex project. Central to the model is a cross-classification of impact sources--production or consumption related, and an impact order which distinguishes between direct project effects, indirect effects and long-run institutional impacts. Data generated in this model is than transformed into alternative displays useful to affected interest groups who would value potential impact tradeoffs. (See also W74-11586) (Schroeder-Wisconsin)
W74-11588

PARAMETER VALUES FOR BENEFIT-COST ANALYSIS,
Wisconsin Univ., Madison. Dept. of Agricultural Economics.
D. Bromley, and J. S. Drake.
In: Ames Reservoir Environmental Study. Appendix 2. Economic and Social Impact, Iowa State Univ., Ames, Report ISWRRI-60-A2 (IUURR-FRS-9-A2), 1973, p 2-4-1--2-4-40, 2 fig, 2 tab, 23 ref.

Descriptors: *Evaluation, *Value engineering, *Multiple-purpose projects, *Welfare(Economics), Cost-benefit theory, Direct benefits, Wildlife, Estimating, Beneficial use, Water utilization, Flood damage, Flood protection, Water supply, Recreation, Reservoirs, Discount rates.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA).

The choice of values or weights generally associated with water resources project impacts and the projected direct economic impacts of Iowa's proposed multiple-purpose Ames Reservoir are critiqued. Among objectives to be accomplished by the reservoir are flood control, recreational development, additional water supplies, improved water quality, and fish and wildlife enhancement. Values for four flood control impacts--reduced property losses, crop losses, indirect production losses, and increased productivity are discussed. The Water Resources Council's interim crop prices--adjusted normalized 1964 prices, specific to the region and projected to 1970--were utilized to determine flood control benefits. The values of recreational impacts were derived utilizing the methodology proposed by Senate Document 97. Water supply and quality impacts were valued according to an alternative cost concept; changes in the stock of fish and wildlife were valued utilizing values established by the Corps of Engineers and the Bureau of Sport Fisheries and Wildlife. Technical and institutional considerations defining an appropriate discount rate are also reviewed. Three rates, 3-1/4, 5-1/2 and 7%, the latter recommended by the Water Resources Council, are evaluated. (See also W74-11586) (Schroeder-Wisconsin)
W74-11589

INDIRECT ECONOMIC EFFECTS,
Iowa Univ., Iowa City. Inst. of Urban and Regional Research.
J. S. Drake.
In: Ames Reservoir Environmental Study. Appendix 2. Economic and Social Impact, Iowa State Univ., Ames, Report ISWRRI-60-A2 (IURR-FRS-9-A2), 1973, p 2-5-1--2-5-31, 4 tab, 9 ref.

Descriptors: *Evaluation, *Indirect benefits, *Cost-benefit theory, Benefits, Input-output analysis, Regional economics, Flood control, Iowa, Reservoirs, Alternative planning, Estimating, Industry, Agriculture.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA), 'Stemming-from' benefits, 'Induced-by' benefits, Cross-industry quotient, Location-quotient techniques.

A gross method to estimate secondary 'stemming-from' and ' induced-by' economic benefits is illustrated for a number of flood protection alternatives in Iowa's Skunk River Basin. The methodology was limited to the tracing of the immediate linkages between the agricultural sector, the farm machinery, and the food and kindred products sectors. The approach begins with national input-output data which is adjusted to approximate the regional interindustry structure utilizing the cross-industry quotient method. The quotient method is a prorating formula which adjusts national technical coefficients through a comparison of the proportion of the national output of the vending sector in the region to that of the purchasing sector. Application of the model is illustrated utilizing 1966 secondary data for the Skunk River Basin. The proposed methodology indicated that potential 'induced-by' secondary benefits were almost zero for all alternatives. 'Stemming-from' benefits caused by increases in output for the food and kindred products sector under strict assumptions were estimated at approximately $80,000/year. The degree of variation in the secondary benefits between the flood control alternatives was too slight to allow their ranking. (See also W74-11586) (Schroeder-Wisconsin)
W74-11590

PEOPLE AND THE RESERVOIR,
Iowa Univ., Iowa City. Inst. of Urban and Regional Research.
J. F. Hultquist.
In: Ames Reservoir Environmental Study. Appendix 2. Economic and Social Impact, Iowa State Univ., Ames, Report ISWRRI-60-A2 (IURR-FRS-9-A2) 1973, p 2-7-1--2-7-27. 1 tab, 7 ref.

Descriptors: *Reservoir construction, *Social impact, *Psychological aspects, Cost-benefit theory, River basin development, Social adjustment, Iowa, Relocation.
Identifiers: *Skunk River Basin(IA), *Ames Reservoir(IA), Relocation Assistance Act of 1970.

The many aspects arising from the planning, development, construction, and operation of a reservoir often present serious disruptions in the lives of the region's residents. Potential disruption impacts are accentuated when the rate of change in the region is accelerated. While the Relocation Assistance Act of 1970 recognized the pecuniary impacts caused by federal projects that displaced residents, non-pecuniary impacts on residents' lives, which often cannot be ameliorated, have been disregarded. Pecuniary and nonpecuniary costs of disruption come in many forms. They result partially from uncertainty as to the ultimate impact of the project. The disruptive impact of Iowa's proposed Ames Reservoir is discussed. Nearby residents felt that the security and the smoothness of their lives have been threatened through a sequence of events: first the proposed reservoir, then an unfavorable notice on the proposed reservoir, then proposed construction of an interstate highway in the region, and finally an announcement that the university was going to re-examine the unfavorable notice given the reservoir. Each of these events has had an effect on the residents. Yet, an analysis of the potential costs of the reservoir do not fully account for the disruption caused during the planning to completion interval. (See also W74-11586) (Schroeder-Wisconsin)
W74-11591

A VIEW OF THE VALLEY'S PEOPLE,
Iowa Univ., Iowa City. Inst. of Urban and Regional Research.
J. F. Hultquist.
In: Ames Reservoir Environmental Study. Appendix 2. Economic and Social Impact, Iowa State Univ., Ames, Report ISWRRI-60-A2 (IURR-FRS-9-A2), 1973, p 2-8-1--2-8-14. 1 fig, 3 tab.

Descriptors: *Effects, *Social impacts, *Multiple purpose projects, Reservoir construction, Alternative planning, Economic impact, Iowa, Regional redevelopment, Psychological aspects.
Identifiers: *Skunk River Basin(IA), *Ames Reservoir(IA).

Adoption of only a flood control scheme will generate differing incidences of benefits and costs among a region's residents. The incidence of people affected was surveyed for a proposed multiple-purpose project including a flood control objective located in the Skunk River Basin in Iowa. A field survey was conducted for a limited portion of the basin with 92 families, representing 361 individuals, interviewed. Under seven alternative project designs compared, three classes of people were identified--those who would be displaced, those who would not be required to move but who would lose property and/or find themselves close to a significant environmental change; and those who would experience only external effects. A summary of the alienation incidences indicates that the first alternative, utilizing two sub-impoundments in addition to a 5000-acre temporary lake, will displace 300 people, disrupt 125, and have external effects on 90 more. A second alternative consiting of 1410-acre recreational lake, without a flood pool would place 60, 250, and 158 people into the respective categories. In an intensive greenbelt plan, while requirng many landowners to transfer land to greenbelt control, few owners would be required to give up major land holdings; 330 people would be externally affected. (See also W74-11586) (Schroeder-Wisconsin)

DIRECT RESERVOIR IMPACT,
Iowa Univ., Iowa City. Inst. of Urban and Regional Research.
J. F. Hultquist.
In: Ames Reservoir Environmental Study. Appendix 2. Economic and Social Impact, Iowa State Univ., Ames, Report ISWRRI-60-A2 (IURR-FRS-9-A2), 1973, p 2-9-1--2-9-4.

Descriptors: *Reservoir sites, *Social aspects, *Highway relocation, Regional economics, Social adjustments, Social impacts, Local government, Area redevelopment, Iowa, Reservoir design, Access routes.
Identifiers: *Skunk River Basin(IA), *Ames Reservoir(IA).

While from a sociological perspective the most significant impact of Iowa's proposed Ames Reservoir will be the disruption in the lives of those displaced, other sociological impact must be evaluated. First, the reservoir's impact on existing transportation routes may be assessed at two levels: the impact on activity patterns and on road development. With respect to the former, much of the impact has been lessened by the previous construction of I-35. While the reservoir may close several east-west routes it may facilitate better access to the Interstate via E-29, especially if this road is extended directly to US-69. With respect to road development, increased recreation-related traffic as well as contemplated road closings will necessitate upgrading of the remaining river crossings. The reservoir may also affect the tax base of the townships and school districts. Each tax loss resulting from land inundation near the dam may be offset by increased property values. Boundaries for school districts will be pushed back rather than isolating portions of each, with potential busing cost reductions. Suppliers to agriculturalists may also be affected by the reduction of 4000+ acres from production. Changes in production levels make this impact difficult to assess. (See also W74-11586) (Schroeder-Wisconsin)
W74-11593

ANTICIPATED POST-CONSTRUCTION IMPACT,
Iowa Univ., Iowa City. Inst. of Urban and Regional Research.
J. F. Hultquist.
In: Ames Reservoir Environmental Study. Appendix 2. Economic and Social Impact, Iowa State Univ., Ames, Report ISWRRI-60-A2 (IURR-FRS-9-A2), 1973, p 2-10-i--2-10-15. 3 fig.

Descriptors: *Project post-evaluation, *Reservoir sites, *Land development, Land use, Iowa, Government finance, Post-impoundment, Sewage, Access routes, Regional development.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA), Coralville-Macbride Reservoirs(IA).

Construction of Iowa's proposed multi-purpose Ames Reservoir may generate dramatic land use changes in Story County. In turn, uncontrolled development could affect the reservoir's water quality, access to the reservoir, and demand for local governmental services. Each of these impacts are assessed for the Ames Reservoir utilizing comparative data from the Coralville-Macbride area, site of existing Iowa reservoirs. Discussions with county officials in the Coralville locality indicated the existence of problems with septic systems although they cause minimal water quality degradation; however, continued subdivision development may accentuate the problem. For the Ames area several factors may mitigate potential water quality problems; these include larger minimum lot sizes--25,000 sq ft--and potential development of a regional water and sewer system. Development adjacent to the Coralville Reservoir has also become a fiscal burden on local government units, road, fire, and law enforcement budgets were increased. Returns from spot developments probably will be insufficient to pay for the services required thereby increasing taxes for all property in the district. Land development may also limit access to the reservoir. Increasing the take lines and access roads to public areas may improve accessibility to the reservoir. (See also W74-11586) (Schroeder-Wisconsin)
W74-11594

THE DOLLAR COSTS,
Iowa Univ., Iowa City. Inst. of Urban and Regional Research.
J. F. Hultquist.
In: Ames Reservoir Environmental Study. Appendix 2. Economic and Social Impact, Iowa State Univ., Ames, Report ISWRRI-60-A2 (IURR-FRS-9-A2), 1973, p 2-11-i--2-11-40. 1 fig, 5 tab.

Descriptors: *Compensation, *Reservoir construction, *Condemnation value, Costs, Project planning, Area redevelopment, Property values, Market value, Relocation, Social impact, Social adjustment, Iowa, Reservoir sites, Estimating.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA), Uniform Relocation Act of 1970, Expropriation.

Four compensation principles--just compensation, fair market value, full compensation, and operationally practical compensation, utilized by the government in determining payments to be made to persons suffering loss as a result of government actions are discussed. The first two principles are based on judicial and market value, respectively. The third reflects the recognition of both the pecuniary and nonpecuniary costs incurred by individuals when 'good' must be relinquished. Operationally practical compensation refers to the degree of compensation permissible under recent interpretations and legislative acts. To illustrate the latter principle, the Corps of Engineers' application of the Uniform Relocation Act of 1970 to losses incurred by individuals affected by Iowa's proposed Ames Reservoir is discussed. Housing structures within the reservoir's proposed take line number 85, including 43 mobile homes. Total cost of land and damages including improvements and severances, contingencies, relocation assistance, acquisition expenses and land management estimates to be paid in part as compensation to displaced residents were estimated at $5,300,000, $6,342,000 and $7,315,000 respectively for low, medium, and high projections. A reduction in the scope of the project resulting in a 27% reduction in the impoundment surface area will decrease total costs of $3,923,700, $4,711,200 and $5,425,250. (See also W74-11586) (Schroeder-Wisconsin)
W74-11595

A SUMMARY OF A STUDY OF CITIZEN VIEWS AND ACTIONS ON THE PROPOSED AMES RESERVOIR,
Iowa State Univ., Ames. Dept. of Sociology.
G. Bultena, D. Rogers, and V. Webb.
In: Ames Reservoir Environmental Study. Appendix 2. Economic and Social Impact, Iowa State Univ., Ames, Report ISWRRI-60-A2 (IURR-FRS-9-A2), 1973, p 2-13-1--2-13-9.

Descriptors: *Social participation, *Attitudes, *Reservoirs, *Reservoir construction, Decision making, Social values, Iowa, Motivation.
Identifiers: *Ames Reservoir(IA), *Skunk River Valley(IA).

The attitudes and behavior of individuals living within the purview of Iowa's proposed Ames Reservoir were examined to determine whether the proposed project is in the 'public interest.' Interviews were conducted with 390 people, selected

by a linked process of area-probability and random sampling. Areas researched were on current and post-project public response, the relationship between citizens' characteristics and attitudes, and the level of public awareness of the current state of the project, and their evaluation of its potential benefits and costs. Approximately one-fourth of the respondents favored the project and 30% were opposed. Characteristics of respondents opposed had little impact on attitudes. Positive support for the reservoir was related to positive attitudes to construction of other reservoirs, the Corps of Engineers, and a developmental orientation to the environment. Flood control and recreation were perceived as the major benefits while opponents claimed too much farmland would be flooded, it would benefit too few people, and would reduce the valley's attractiveness. Only a small proportion, 7%, of the respondents had engaged in activities designed to influence governmental decisions. A 4:1 ratio of people opposing to those approving the project were active in efforts to influence decision making. (See also W74-11586) (Schroeder-Wisconsin)

AMES RESERVOIR ENVIRONMENTAL STUDY. APPENDIX 3. OUTDOOR RECREATION AND OPEN SPACE.
Iowa State Univ., Ames.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 402, $15.00 in paper copy, $2.25 in microfiche. Iowa State Water Resources Research Institute Report ISWRRI-60-A3, 1973. 181 p, 13 fig, 74 tab, 49 ref. OWRT A-999-IA(8c).

Descriptors: *Alternative planning, *Recreation, *Iowa, *Reservoirs, Cost-benefit analysis, Project planning, Financing, Multiple-purpose projects, Benefits, Recreation demand, Attitudes, Land use, Costs, Evaluation, Administrative agencies, Future planning(Projected), Environmental effects.
Identifiers: *Ames Reservoir(IA), *Skunk River Valley(IA), Story County(IA), Greenbelt development.

This appendix contains the results of studies of the problems encountered concerning outdoor recreation and open space use and their related environmental impacts. Measurement of current recreational use of the Skunk River Valley near the proposed Iowa's Ames Reservoir site using representative surveys and sampling techniques indicated that the most popular activities were golfing, fishing, nature studies, and picnicking. Activity days for all users totaled 35,846. Changes in recreation demand are estimated for several development plans including the proposed reservoir, a minimum conservation pool, and a greenbelt corridor. Benefits of each alternative are computed utilizing user-day values suggested by the Water Resources Council and juxtaposed to their land, capital, operating, maintenance, and replacement costs. Recreation benefit-cost ratios computed yield 0.794 for the proposed reservoir, 0.964 for intensive greenbelt development, and 8.460 for the status quo. A companion study for recreational patterns on an established reservoir--Coralville-Lake Macbride--indicates those elements which attract various user groups to a site. Impacts of the proposed reservoir on the policies and financial resources of the Story County Conservation Board, who is responsible for recreational sites, are also discussed. (See W74-11598 thru W74-11604) (Schroeder-Wisconsin)

CURRENT RECREATION USE,
Iowa State Univ., Ames. Dept. of Forestry.
G. E. Campbell, and J. O. Dawson.
In: Ames Reservoir Environmental Study. Appendix 3. Outdoor Recreation and Open Space, Iowa State Univ. Report ISWRRI-60-A3, 1973, p 3-1-ii--3-1-26. 5 fig, 12 tab.

Descriptors: *Recreation, *Reservoir sites, *Recreation demand, Golf courses, Parks, Sport fishing, Recreation facilities, Reservoirs, Iowa, Sampling, Use rates, Attitudes.
Identifiers: *Ames Reservoir(IA), *Skunk River Valley(IA).

Current outdoor recreation activities and development opportunities are assessed for Iowa's proposed Ames Reservoir on the Skunk River in Story County, between Ames and Story City. The area has sustained a varied wildlife population including waterfowl, upland, small and large game, plus several fish species. The surrounding area is primarily in intensive farming. Several public access and recreational areas are available on or near the proposed reservoir site including a number of parks and a golf course. Outdoor recreation opportunities presently available include fishing, camping, hiking, canoeing, golfing, and hunting. Estimates of current use, obtained through unequal probability sampling which accounted for a number of factors including total man-hours of recreation by activity, average length of stay by activity, and total activity days by activity, indicate that the most popular activities were golfing, fishing, nature study, and picnicking, yielding total activity days of 13,082, 6,570, 5,353, and 3,634, respectively. Activity days for all activities totaled 35,846. Low participation in other recreation forms may reflect limited facilities rather than demand. The qualitative impact on future demand and use of the recreational sites at the proposed reservoir is briefly discussed. (See also W74-11597) (Schroeder-Wisconsin)
W74-11598

RECREATION USE PROJECTIONS FOR THE PROPOSED AMES RESERVOIR AND ALTERNATIVES,
Iowa State Univ., Ames. Dept. of Forestry.
G. E. Campbell, and J. O. Dawson.
In: Ames Reservoir Environmental Study. Appendix 3. Outdoor Recreation and Open Space, Iowa State Univ. Report ISWRRI-60-A3, 1973, p 3-2-i--3-2-40. 5 fig, 16 tab, 12 ref.

Descriptors: *Forecasting, *Recreation, *Reservoirs, Iowa, Recreation demand, Alternative planning, Recreation facilities, Use rates, Model studies.
Identifiers: *Ames Reservoir(IA), *Skunk River Valley(IA).

The impact of Iowa's proposed Ames Reservoir and several alternative projects on outdoor recreation and open space use are explored. Included in the alternatives considered were (1) the Ames Reservoir with two subimpoundments, (2) a minimum conservation pool for recreation without water quality, flood control, or storage, (3) a tributary recreational lake development and (4) moderate to intensive greenbelt development. Predictive equations utilized projected user demand for each alternative on assumed use as related to population, distance from site to population centers, and supply and demand characteristics of recreation facilities for each site. Gravity models for each and all combined activities were prepared for alternative 1 - 3 incorporating distance from all population centers to all recreation sites and relative supply at each site in terms of average available land and/or water. Modeling results, assuming medium population growth projections, indicated total use in 1970 and 1980 of 277,343 and 306,323 and 234,176 and 258,646, for example, for the first two alternatives. Projected use demand was also estimated for the proposed reservoir configuration assuming only minimum facilities and no federal cost-sharing. The impact of mud flats, flooding, agricultural land, and public access to the recreational sites on user demands and alternative project demands are also discussed. (See also W74-11597) (Schroeder-Wisconsin)

COSTS OF RECREATION BENEFITS,
Iowa Univ., Iowa City. Inst. of Urban and Regional Research.
W. G. Beardsley.
In: Ames Reservoir Environmental Study. Appendix 3. Outdoor Recreation and Open Space, Iowa State Univ., Report ISWRRI-60-A3, 1973, p 3-3-i--3-3-16. 6 tab, 5 ref.

Descriptors: *Costs, *Recreation, *Reservoir sites, Iowa, Access routes, Recreation facilities, Beaches, Camping, Boat-launching ramps, Administrative costs, Operating costs, Maintenance costs, Capital costs.
Identifiers: *Skunk River Valley(IA), *Ames Reservoir(IA).

Cost estimates of providing recreation should include a number of items including the cost of additional land, access roads, recreational facilities, annual operating, maintenance and replacement, as well as the loss of current and future demand at alternative sites. To illustrate the relative magnitude of each of these elements six alternative recreational plans are costed for a central Iowa site including unit costs, item quantities and acreage. For the first alternative the optimal development of the Ames Reservoir with two subimpoundments, total construction, land, and total cost were $1,704,400, $415,000 and $6,227,100, respectively. A second plan consisting of a minimum conservation pool without subimpoundments resulted in $1,366,520, $415,00 and $5,096,370. A tributary lake produced respective costs of $659,600, $235,00 and $2,442,200. Green belt development generated costs of $70,900, $39,600 and $276,500. Even without development, annual operation, maintenance, and replacement costs for existing regional recreational facilities will result in over $27,600 in costs. VALUE OF RECREATION BENEFITS,
Iowa Univ., Iowa City. Inst. of Urban and Regional Research.
W. G. Beardsley.
In: Ames Research Environmental Study. Appendix 3. Outdoor Recreation and Open Space, Iowa State Univ. Report ISWRRI-60-A3, 1973, p 3-4-1--3-4-17. 7 tab, 11 ref.

Descriptors: *Water resources development, *Recreation, *Value, Reservoirs, Pricing, Value engineering, Multiple-purpose projects, Streams, Iowa, Alternative planning, Social values, Evaluation.
Identifiers: *Skunk River Valley(IA), *Ames Reservoir(IA), Story County(IA).

The determination of recreational values often plays a significant role in the analysis of benefits and costs of multipurpose water development projects. Senate Document 97 directed federal agencies to value recreational benefits in terms of the direct benefit perceived by users rather than through the cost of development or income generated by recreationists' expenditures. Suggested values provided by the Document for warm water fishing, picnicking, nature studies, and canoeing in placid waters generate unit-day values ranging from $0.50 - $1.50. Recreational opportunitity-limited days involving activities of low use intensity which may involve large personal expenditures include cold water fishing, wilderness pack trips, or white water boating. Unit-day values for this group range from $2.00 - $6.00. A proposed revision of these figures has been suggested, raising unit-day values to $0.75 - $2.25 and $3.00 - $9.00. Use of these values in constructing benefits and costs are illustrated for a number of recreational project designs in the Skunk River Valley, Iowa. Assignment of values depended on water quality levels, expected debris, presence of mud flats, saving of forested areas, as well as the number of recreational experiences provided. Recreational losses from construction of the

proposed alternatives are also measured. (See also W74-11597) (Schroeder-Wisconsin)

RECREATION USE AND USERS OF THE CORALVILLE-MACBRIDE AREA: A COMPARATIVE CASE STUDY,
Iowa Univ., Iowa City. Inst. of Urban and Regional Research.
J. S. Gardner, and N. B. Hultquist.
In: Ames Reservoir Environmental Study. Appendix 3. Outdoor Recreation and Open Space, Iowa State Univ., Report ISWRRI-60-A3, 1973, p 3-5-i--3-5-88. 2 fig, 30 tab, 21 ref.

Descriptors: *Water resources development, *Recreation, *Management, Recreation facilities, Attitudes, Recreation demand, Water sports, Reservoirs, Social aspects.
Identifiers: *Coralville-Macbride area(IA), *Skunk River Valley(IA), *Ames Reservoir(IA).

Recreationists' perceptions of the biophysical environment, facilities and management, accessibility and users' socioeconomic characteristics were surveyed for the Coralville Reservoir-Macbride Lake complex, one of Iowa's major recreational areas. Data for the survey was collected through 223 interviews conducted at three access points on the reservoir and two on Macbride Lake during 1972. Two formats were utilized, one with a set of statements and recreational activities which respondents ranked on a continuum of agree-disagree and like-dislike and the other providing for a better ranking of preferences of specific groups, e.g., fishermen. Respondents were also presented four pairs of photographs depicting varying combinations of vegetation, topography, and facilities and asked to make preferential choices. The majority of users within 50 miles of the complex, use it primarily for water related activities, camping, or relaxation. Access, facilities, and water resources are among the primary attractants while certain facilities and management were listed as unattractive. Facilities and improvements preferred by various user groups were also identified. This information could influence future development plans for this complex and other proposed projects. Results of a similar study of the proposed Ames Reservoir's potential uses obtained through a mail return survey are also presented and compared. (See also W74-11597) (Schroeder-Wisconsin)

IMPACT OF PROPOSED AMES RESERVOIR ON STORY COUNTY CONSERVATION BOARD PROGRAMS,
Story County Conservation Board, Iowa.
R. Pinneke.
In: Ames Reservoir Environmental Study. Appendix 3. Outdoor Recreation and Open Space, Iowa State Univ., Report ISWRRI-60-A3, 1973, p 3-6-1--3-6-4.

Descriptors: *Administrative agencies, *Recreation, *Reservoir construction, Financing, Budgeting, Comprehensive planning, Iowa, Local governments, Recreation facilities.
Identifiers: *Ames Reservoir(IA), *Story County(IA), Story County Conservation Board.

Construction of multipurpose water development projects often places additional strain on local agencies' budgets and programs. A number of such impacts, the potential result of the proposed Ames Reservoir in Iowa, will affect the Story County Conservation Board. Duties of this Board include the provision and maintenance of recreation and conservation areas as well as generation and promotion of the county's comprehensive recreation plan. The major impact of the proposed reservoir will be a dramatic change in the physical environment available for recreation and conservation purposes. A number of such sites will be inundated, and access to some may be curtailed. While the proposed reservoir is expected to satisfy basic recreation needs, it is apparent that the projected recreation demand exceeds the supply, forcing the Board to consider provisions of new facilities as well as long term financial entanglement to meet its cost-sharing responsibilities to satisfy financial requirements. The reservoir's additional facilities may run counter to the Board's earlier comprehensive plan and limited fiscal resources may force it to modify both its objectives and development priorities. ALTERNATIVE 4A: INTENSIVE GREENBELT DEVELOPMENT AS AN ADDITIONAL CONSIDERATION,
Iowa Univ., Iowa City. Inst. of Urban and Regional Research.
H. H. Webster, M. D. Dougal, W. G. Beardsley, J. C. Gordon, and G. E. Campbell.
In: Ames Reservoir Environmental Study. Appendix 3. Outdoor Recreation and Open Space, Iowa State Univ. Report ISWRRI-60-A3, 1973, p 3-7-i--3-7-10. 1 fig, 3 tab.

Descriptors: *Cost-benefit analysis, *Recreation, *Alternative planning, Reservoir construction, Land use, Zoning, Benefits, Costs.
Identifiers: *Ames Reservoir(IA), *Skunk River Valley(IA), Greenbelt development.

An alternative to reservoir-based recreation is maintenance of a greenbelt corridor which preserves the area in its natural state. A greenbelt design suggested as an alternative to Iowa's proposed Ames Reservoir assumes that the environment could be maintained through careful land-use planning, zoning, and private ownership. Only 72 acres would be purchased to provide access points and intensive-use recreational sites. Experience in Story County, site of the proposed reservoir, indicates that future development and consequent destruction of the natural setting may not be easily forestalled. It follows that if a scenic greenbelt corridor is desirable then a greater measure of public control or ownership in the valley must be assumed. An alternative greenbelt development plan reviewed suggests acquisition of a 100-foot strip on both sides of the Skunk River and of significant segments of bottomland forests and upland forests and pastures. Additional acreage can be controlled through leases and flood plain zoning. Six intensive recreation sites providing hiking, nature studies, camping and water-related activities are also proposed. Total cost of the alternative is $4,410,260 with a benefit-cost ratio of 0.964 contrasted to a benefit-cost ratio of 0.794 for the proposed reservoir. (See also W74-11597) (Schroeder-Wisconsin)

AMES RESERVOIR ENVIRONMENTAL STUDY. APPENDIX 4. PHYSICAL RELATIONSHIPS WITH THE AGRICULTURAL SECTOR.
Iowa State Water Resources Research Inst., Ames.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 403, $16.00 in paper copy, $2.25 in microfiche. Report ISWRRI-60-A4, 1973. 262 p, 20 fig, 48 tab, 120 ref. OWRT A-999-IA(8d).

Descriptors: *Multipurpose projects, *Reservoir sites, *Agronomy, *Cost-benefit analysis, Reservoirs, Flood control, Tile drainage, Terracing, Flood damage, Flood forecasting, Crop production, Farm prices, Flood data, Mathematical studies, Sediment load, Reservoir silting, Sediment transport, Sediment distribution, Sediment yield, Iowa, Farm wastes, Waste disposal, Cost analysis, Farm management, Pesticides, Herbicides, Insecticides, Fertilizers, Nitrates, Phosphates, Land use.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA).

The physical, social, and economic milieu surrounding Iowa's proposed Ames Reservoir is examined in connection with the effects on the watershed's environment. Several agricultural production decisions including fertilizer application methods and levels, pesticide and herbicide use, and animal waste management techniques are discussed. The watershed is generally level and highly cropped--three-quarters presently in corn and soybeans. A 1972 sampling indicated that tile effluent and subsurface seepage was a primary source of nitrate-nitrogen in the Skunk River. The potential impact of a number of chemicals including chlorinated hydrocarbon, organophosphorus, and carbomate insecticides and herbicides on the environment are compared. The watershed contains a number of livestock operations; surveys of alternative animal waste disposal methods indicate that the traditional spreading method remains both economically and environmentally most sound. Present land use techniques in the basin have lead to an estimated 300 ton/sq mi/year total long term sediment production rate. Methods to distribute this sediment within the region are suggested. Benefit analyses from the proposed reservoir depend on the estimated flood damage, price, and yield data. A number of flood frequency distributions are reviewed and the sensitivity of the Corps of Engineers' proposed benefit/cost ratio to changes in these factors is considered. AGRICULTURAL LAND USE PATTERNS,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
E. R. Duncan, W. D. Shrader, and D. B. Palmer.
In: Ames Reservoir Environmental Study. Appendix 4, Physical Relationships With the Agricultural Sector, Iowa State Univ. Report ISWRRI-60-A4, 1973, p 4-1-i--4-1-23. 1 fig, 10 tab, 3 ref.

Descriptors: *Agricultural watersheds, *Reservoir sites, *Land use, Farm management, Crop production, Iowa, Crops, Preimpoundment, Flooding.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA).

The impact of the proposed Iowa Ames Reservoir on agricultural land use patterns is presented. The reservoir site is located on the Skunk River and contains some of the highest quality soils in the United States. Cropped area varies from 70-80% within the watershed. Within the reservoir site the percent of cropped land is low, ranging from 30% near the reservoir to about 60% near the take line. Historic crop yields vary from 85, 32, and 57 bushels/acre for corn, soybeans, and oats and 2.0 ton/acre for hay in the conservation pool to 97,32, 60, and 2.8 for the flood pool to the take line, respectively. Historical data presented covering water depth, and days of inundation and the resultant percentage yield reduction by crop indicates that it may be feasible to crop some land beneath the take line because of the low flooding frequency. Reed Canary grass was cited as feasible to convert the area to grazing above the conservation pool because of its capacity to tolerate extended periods of inundation. Cropping practices are predicted to remain unchanged as a result of the reservoir with large portions of the watershed to remain in cropland. (See also W74-11605) (Schroeder-Wisconsin)

WATER QUALITY IMPLICATIONS OF LIVESTOCK PRODUCTION,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
T. E. Hazen, D. H. Vanderholm, and J. R. Miner.
In: Ames Reservoir Environmental Study. Appendix 4. Physical Relationship With the Agricultural Sector, Iowa State Univ. Report ISWRRI-60-A4, 1973, p4-4-i--4-4-32. 13 tab, 13 ref.

Descriptors: *Waste disposal, *Water quality, *Farm wastes, Water pollution control, Waste treatment, Economics, Farm management, Cost analysis, Capital costs, Operating costs, Iowa, Feed lots, Runoff, Reservoirs.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA).

Animal wastes are major water pollution sources however the impact of such wastes can be controlled through alternative management techniques. A survey of the literature indicates that the application of wastes by spreaders, manure tank wagons, and irrigation can reduce to less than 1% the portion of excreted pollutants escaping into the environment. Treatment methods, including oxidation ditches, anaerobic and aerated lagoons, are also considered although none yield acceptable effluent for surface water courses. The impacts of animal waste and potential management policies on the water quality of Iowa's Ames Reservoir basin is evaluated. Though livestock production in the region is not intensive--no cattle or swine operations exceed 1000 head--it is still of major importance. Over 2 million pounds of manure are produced daily most of which is applied to cropland. Management practices including prevention of direct waste discharges, locating feed lot boundaries away from streams, and fencing animals where they might disturb banks are recommended. Runoff control costs vary from $1.00 to $10.00 per head according to feed lot size. Manure management, loss of grazing areas adjacent to water, and aesthetic conservation are also costs to be evaluated. (See also W74-11605) (Schroeder-Wisconsin)
W74-11609

RESERVOIR SEDIMENTATION,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
B. Nudd, and C. E. Beer.
In: Ames Reservoir Environmental Study. Appendix 4. Physical Relationship with the Agricultural Sector, Iowa State Univ. Report ISWRRI-60-A4, 1973, p 4-5-i--4-5-35. 6 fig, 7 tab, 8 ref.

Descriptors: *Reservoirs, *Sediment yield, *Reservoir silting, *Mathematical models, Sediment load, Sediment discharge, Sediment distribution, Sediment transport, Watershed management, Iowa, Sedimentation rates, Deposition(Sediments).
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA), Area correlation.

Estimating techniques to determine the sediment yield to Iowa's proposed Ames Reservoir, utilizing data from four of that state's watersheds having similar physical characteristics, are presented. Area correlation results in total long term sediment production rate estimates of 300 tons/sq mi/year composed of the outcome of an extension of the fitted straight line from the observed watersheds and sediment values 2-tuple plus the addition of 10% of the suspended load to allow for bed load. Sediment production potentials of areas within the region are also estimated. These areas consist of watershed segments having similar gross erosion rates, amount of soil detached, and delivery ratios to allow estimates of the percentage each contributes to the sediment load. For the Ames Reservoir basin, divided into four subdivisions, the universal soil loss equation and data from a comparable watershed, compilations suggest that at least three-quarters of the total sediment load is produced by the valley area, a small proportion of the 314 sq mi watershed. Earlier reservoir storage loss estimates of 8400 acre-feet--24% of the combined sediment and conservation pools are confirmed. Improved conservation practices could reduce the reservoir storage loss by one-half. (See also W74-11605) (Schroeder-Wisconsin)
W74-11610

WATER CONTROL ON AGRICULTURAL LAND,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
D. B. Palmer.
In: Ames Reservoir Environmental Study. Appendix 4. Physical Relationship with the Agricultural Sector, Iowa State Univ. Report ISWRRI-60-A4, 1973, p 4-7-i--4-7-24. 5 fig, 4 tab, 5 ref.

Descriptors: *Flood control, *Reservoirs, *Economic justification, *Agriculture, Cost-benefit analysis, Cost-benefit theory, Benefits, Iowa, Flood damage, Flood control, Flood forecasting, Flood frequency, Flood protection, Frequency analysis, Farm prices, Flood plains.
Identifiers: *Skunk River Basin(IA), *Ames Reservoir(IA), Log-Pearson method.

A major component of the economic justification for Iowa's proposed Ames Reservoir was the reduction of flood damages. Cost-benefit estimates prepared by the Corps of Engineers are analyzed. Four components which influence this determination are considered: project flood distribution, product prices, production costs, and crop yield. To construct the first, a log-Pearson Type III distribution, recommendated by the Water Resources Council was utilized to develop damage probability curves based on the regional multiple regression analysis approach of the Iowa Natural Resources Council. Utilization of this distributive form resulted in a reduction of benefits from $681,000 to $354,000. Flood control benefits are also shown sensitive to prices, costs, and yields. An alternative set of such values considered reasonable could result in a 7% increase in the original values estimated by the Corps. Two alternative estimates of flood damages were also explored; one published by the U.S. Weather Bureau yielded an average annual loss of $333,000 for a 38 year period. Changes in land values within the region, however, did not clearly reflect income losses as a result of flooding. Flood plain management techniques are also examined as alternatives to the proposed reservoir. (See also W74-11605) (Schroeder-Wisconsin)
W74-11612

ALTERNATIVE LAND AND WATER MANAGEMENT PROGRAMS,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
D. B. Palmer.
In: Ames Reservoir Environmental Study. Appendix 4. Physical Relationship with the Agricultural Sector, Iowa State Univ. Report ISWRRI-60-A4, p 4-8-i--4-8-13. 1 fig, 2 tab, 3 ref.

Descriptors: *Alternative planning, *Reservoirs, *Project planning, *Watershed management, Drainage programs, Tile drainage, Watershed Protect and Flood Prevention Act, Sediment control, Iowa, Terracing, Flood control, Small watersheds.
Identifiers: *Ames reservoir(IA), *Skunk River Basin(IA).

The need for alternative reservoir designs is a function of a number of factors including the existing agricultural practices and activities. For the proposed Ames Reservoir implementation of Public Law 566 small watershed projects could vary the optimum reservoir configuration. Such projects could provide for improved drainage, flood control, wildlife improvement, recreation, water supply, and erosion control, elements often cited to justify the Ames Reservoir in the Skunk River Basin, Iowa. Ten subwatersheds identified in the basin could be beneficiaries of P.L. 566 projects with those above the reservoir potentially benefiting from improved drainage and small flood damage relief and those below obtaining drainage benefits. Terracing decisions could also result in flood control benefits altering the need for the reservoir. Terracing along the Floyd River in Iowa could lead to a 31% reduction in peak runoff for a 2.86 inch runoff and 37% terracing. Tile outlet terracing by farmers also promotes flood control, sediment control, as well as control of nutrient and pesticide runoff. Some of these benefits may be adversely affected by the proposed reservoir construction through inundations caused by the reservoir's fluctuating water levels requiring certain modifications in existing tile systems located between 950-976 feet. (See also W74-11605) (Schroeder-Wisconsin)
W74-11613

AMES RESERVOIR ENVIRONMENTAL STUDY. APPENDIX 5. PHYSICAL RELATIONSHIP WITH THE URBAN SECTOR.
Iowa State Water Resources Research Inst. Ames.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 404, $33.50 in paper copy, $2.25 in microfiche. Report ISWRRI-60-A5, 1973. 552 p, 114 fig, 145 tab, 182 ref. OWRT A-999-IA (8e).

Descriptors: *Water resources development, *Multiple-purpose projects, *Reservoir design, Human population, Projections, Iowa, Flood control, Water management(Applied), Urban hydrology, Urban drainage, Watershed management, Flood plain zoning, Non-structural alternatives, Regional development, Regional analysis, Groundwater resources, Alternative planning, Waste water, treatment, Flood damage, Water quality standards, Forecasting, Cost analysis, Economic justification, Simulation analysis, Water level fluctuation, Chemical analysis, Municipal water, Reservoir design, Water requirements, Benefits, Sewage districts, Public utility districts, Water supply, Mathematical models.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA), Ames(IA), Story City(IA), Story County(IA).

The interrelationships between urban growth, population growth, alternative water sources and urban needs, water pollution and waste treatment requirements, urban flood damage, and existing flood plain management techniques, on the optimal design of Iowa's proposed Ames Reservoir are evaluated. Benefits arising from the water supply function of the reservoir depend in part on the first five foregoing elements. By generating population projections for 1970-2020 future per capita water demands are projected for Ames. Under median assumptions of birth and economic growth rates, existing Ames water sources must be augmented by the year 2000. An evaluation of potential groundwater sources is also made. Annual water supply benefits equal to the cost differentials of providing equal quality water from the reservoir or groundwater sources varied from $1430-$2170. Regional management techniques to develop a regional water supply and treatment provision within the basin are also discussed. The proposed reservoir will also affect waste water treatment. A mathematical simulation of stream water quality at Ames is presented and the impact of waste water quality requirements are assessed. Urban flood damages of $29,600 will also be eliminated by the proposed reservoir. Flood plain management as an alternative approach is discussed. (See W74-11615 thru W74-11622) (Schroeder-Wisconsin)
W74-11614

POPULATION PROJECTIONS FOR AMES AND THE RESERVOIR AREA OF INFLUENCE,
Iowa State Univ., Ames. Dept. of Civil Engineering.
R. L. Rossmiller, and M. D. Dougal.
In: Ames Reservoir Environmental Study. Appendix 5. Physical Relationship with the Urban Sector, Iowa State Univ. Report ISWRRI-60-A5, 1973, p 5-1-i--5-1-90. 32 fig, 53 tab, 20 ref.

Descriptors: *Human population, *Water resources development, *Iowa, *Projections, Multipurpose reservoirs.
Identifiers: *Ames Reservoir(IA), Story County(IA), Ames(IA).

Population projections for Iowa and the proposed Ames Reservoir area are discussed. Over the 1920-1970 period, Iowa's population only grew by 420,000, a partial result of high emigration. Projections taken from a compendium of earlier state and federal studies have estimated population growth ranging from 0.50% by 2020, assuming differing fertility, death, and migration rates. Population projections are made for the period of 1970-2020 in five year increments for the area surrounding the reservoir site--Ames and Story County--by utilizing the component method. Factors included in the method are Iowa State University population at Ames, non-student population of Ames, the Story County rural areas, and urban areas of Story County. Sensitivity of the projections to alternative birth and economic conditions is also examined. Population projections for ISU depend on birth rates, state population projections, and educational trends, and for the remainder of Ames, on future industrial and commercial growth. Projections for the remainder of Story County are made utilizing (1) graphical extrapolation of rural and urban categories and (2) through birth, death, and migration rates of the entire county. Population projections for a four and nine county area surrounding the reservoir and area projections for the 2020-2070 period were also made. (See also W74-11614) (Schroeder-Wisconsin)

EVALUATION OF THE GROUNDWATER RESOURCE IN THE UPPER SKUNK RIVER BASIN,
Iowa State Univ., Ames. Dept. of Civil Engineering.
M. D. Dougal, L. V. A. Sendlein, and J. F. Wiegand.
In: Ames Reservoir Environmental Study. Appendix 5. Physical Relationship with the Urban Sector, Iowa State Univ. Report ISWRRI-60-A5, 1973, p 5-2-i--5-2-84. 39 fig, 8 tab, 18 ref.

Descriptors: *Groundwater resources, *Reservoir construction, Dewatering, Seepage, Aquifer characteristics, Aquifer systems, Computer models, Groundwater availability, Analysis, Iowa, Reservoir releases, Water supply.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA).

Releases from the proposed Iowa Ames Reservoir, as they may affect the groundwater regime, are discussed in connection with the groundwater at the reservoir site, evaluation of the safe yield and maximum sustained yield of the Ames aquifer, and the general response of groundwater levels in the flood plain downstream of Ames to rises in stream stage. The response of aquifers at several locations to pumping or to stream rises occurring from flood stages was examined. A digital computer model of the well fields at Ames was developed to assist in determining the yield of the combined City-Iowa State University system. Studies were used to determine the conditions under which the reservoir might be most advantageous and alternatives which may be necessary if the reservoir is not built. The seepage potential was evaluated since the piezometric gradient would be increased measurably once the reservoir operated at either conservation pool or flood pool elevations. At proposed conservation pool elevations of 940 or 950 ft little effect on the artesian piezometric surfaces would be expected; at the maximum flood pool elevation of 976 ft (or 965 ft) more downstream portions of the confined aquifers will have hydraulic loading equivalent to a 20-30 ft depth of water.
